Preface

This volume is a comprehensive general reference work intended for scholars, students, writers, and the general public on “American folklore,” which is defined here as North American folklore, including Canadian but excluding, except for a few general topics, the folklore of Native Americans, which will be covered in its own encyclopedia. However, under many topics—immigrant folklore, African American folklore, occupational folklore, genres of folklore—reference to areas outside the United States and Canada was inevitable.

In 1930, Alexander H. Krappe called American folklore “a bad misnomer,” asserting that there existed “only European (or African, or Far Eastern) folklore on the American continent.” More usefully, in 1978, Richard M. Dorson distinguished between “Folklore in America” and “American Folklore,” repeating the call that he had sounded decades before for more attention by folklorists to “the background of American history, with its unique circumstances and environment” and to both the adaptations of older folklore and the creation of new folklore against this historical background. The present encyclopedia affirms that “American folklore” indeed does exist, and it includes in its scope both the older adapted themes and the newer original ones developed within the larger cultural matrix of American history.

The qualifier “American” should be understood in the titles of all of the extensive entries gathered here for folklore genres, folk groups, scholarly approaches, general topics, folk performers, and folklorists. For the latter category—folklore scholars—only those people whose life work has been completed have been included. Living folklorists are not represented. For folk performers, this living-person rule was not applied, although a close association of each performer's work with genuine folk tradition was required. The range of general topics covered runs from traditional areas like folklore scholarship, film and folklore, history and folklore, mass media and folklore, parody in folklore, and public folklore to such leading-edge topics as bodylore, coding in American folk culture, cultural studies, computer folklore, empowerment, organizational folklore, and postmodernism.

Readers interested in a survey of scholarly approaches to American folklore might begin by reading the entries AMERICAN FOLKLORE SCHOLARSHIP: THE EARLY YEARS, CANADIAN FOLKLORE, ETHICS IN FOLKLORE RESEARCH, FIELDWORK, FOLKLIFE MOVEMENT, and MATERIAL CULTURE before turning to the specific “approaches” topics: ANTHROPOLOGICAL, COMPARATIVE, CONTEXTUAL, FEMINIST, FUNCTIONALISM, MARXIST, ORAL-FORMULAIC, PSYCHOLOGY OF FOLKLORE, SEMIOTIC, SOCIOLOGICAL, and STRUCTURAL. Similarly, one might read the general entry REGIONAL FOLKLORE before consulting the specific regional articles: NEW ENGLAND, MIDDLE ATLANTIC, ADIRONDACKS, APPALACHIA, PIEDMONT, MIDWEST, GREAT PLAINS, SOUTH, OZARKS, SOUTHWEST, ROCKY MOUNTAINS, NORTHWEST COAST

AND ALASKA, AND GREAT BASIN. Or the general entries ETHNIC FOLKLORE and IMMIGRANT FOLKLORE, STUDY OF, could be read first as an introduction to the entries on ethnic and immigrant groups: AFRICAN, BALTIC, BASQUE, CAJUNS, CHINESE, DUTCH, FILIPINO, FINNISH, FRENCH, GERMAN, GREEK, GYPSIES, HUNGARIAN, IRISH, ITALIAN, JAPANESE, POLISH, ROMANIAN, SCANDINAVIAN, SCOTTISH, SLAVIC, UKRAINIAN, and WENDS.

Of course, every entry and its reference list is an independent entity worth consulting on its own merits, with no prior review of a general topic required. A “see also” line for most entries indicates cross-references to related topics.

The major American folklore genres and occupational folk groups have been included, insofar as reference material exists to document them, but we did not attempt to cover all minor genres, occupations, and hobbies that may have their own distinctive folklore. Thus, there are long essays on such genres as CUSTOM, FOLKSONG, FOLKTALE, GAMES, MYTH, PROVERBS, RIDDLES AND PUZZLES, and SUPERSTITION, but shorter entries on such genres as ANECDOTE, ANTI-LEGEND, CADENCE CHANT, DOZENS, JACK TALES, MNEMONIC DEVICES, PRAYER, RECITATION, and SHIVAREE. Similarly for occupations, we have longer entries for COWBOYS, FARMERS, LOGGERS, RAILROADERS, STEELWORKERS, and the like, but shorter ones for groups like BIKERS, BIRDERS, LAWYERS, MEDICAL PROFESSIONALS, PRINTERS, and WATERMEN.

Readers will find all of the expected arts and crafts of American folk tradition represented here: BASKETMAKING, BLACKSMITHING, COSTUME, NEEDLEWORK, POTTERY, QUILT MAKING, WEAVING, WOOD CARVING, and so on, as well as some perhaps less familiar, like BOATBUILDING, PAPER CUTTING, TATTOOING, and the creations produced by “outsider artists.” In like manner, there are, predictably, entries on major musical forms, such as BALLAD, BLUEGRASS, BLUES, CHANTEYS, GOSPEL MUSIC, LULLABY, LYRIC SONG, PLAY-PARTY, SHAPE-NOTE SINGING, SPIRITUALS, and WORK SONG but also less-expected entries on such forms as *CONJUNTO* MUSIC, COUNTRY MUSIC, ELVIS, FILK Music, JAZZ, KLEZMER, RAP, and ZYDECO.

Each user of this volume, we hope, will find special surprises and pleasures in it. For his own part, the editor confesses to having a special affinity for the entries AUTOHARP, CATFISH, CON ARTIST, COW TIPPING, CURSING, FISHING (SPORT), NUCLEAR LORE, OUIJA, SHEEP CAMP, and UFO LORE, none of which were on the originally planned entry list but all of which yielded fascinating essays in the hands of the experts who wrote them.

American folklore is a large and diversified field with a long and proud tradition of scholarship devoted to its collection and interpretation. This encyclopedia is the first serious attempt to provide a detailed reference source on the field, based on the work of academic folklore specialists. The net was cast widely, but in the confines of a one-volume book much had to be summarized or even omitted. So, besides using the reference lists following many individual entries, the reader is urged to consult such general sources as the following.

American Folklore

A

Academe, Folklore of

Folk traditions of the college and university campus. The academic world consists of two principal subcultures—student and faculty—which, like all groups sharing common concerns over long periods of time, have developed constellations of folk belief, custom, folk speech, legend, jocular narrative, and ritual.

The most prevalent folk beliefs among university students (beyond the assumption that a college education leads to a job in “the real world”) fall into two arenas of potential anxiety: class attendance and examinations. In both contexts, certain excuses (such as “my grandmother is dying”) are believed to be more efficacious than others in obtaining pardon or permission for missing something for which the student has already paid. Virtually universal among American college students in their first two years of university work is the belief that there is a standard waiting period for a professor who does not arrive punctually. The most common system requires students to wait five minutes for an instructor, ten for an assistant professor, fifteen for an associate professor, and twenty for a full professor, although one also hears of ten minutes for a non-Ph.D., twenty for a Ph.D., fifteen for most faculty, all period if necessary for a full professor. This set of beliefs, like most folklore, is not learned from formal authority (indeed, such an obligation has yet to be found in the formal student rules of any American university), but from other members of the folk group: in this case, other students. University students in Germany, by contrast, routinely arrive in the classroom about fifteen minutes *after* the scheduled time, an acknowledged manipulation of time called *der akademische Viertel* (the academic quarter [hour]).

Students facing examinations, especially “finals,” try to affect their fortunes or their self-confidence by wearing lucky clothes (such as a shirt that was worn during a previous exam that was successful), carrying amulets, dolls, or special pens, hoping the exam falls on a lucky day (including the seventh, fourteenth, or twenty-first of the month), avoiding normal personal grooming (not combing hair, not shaving, or wearing “grubbies”), abstaining from sex (to conserve brain energy), and knocking loudly on the desk before starting the exam. While these observances may seem superficially to be either naive or simple matters of haste, they all fall into quite ancient categories of psychological tradition. In addition to the student’s own talents in the class, which are affected by a number of variables, and in response to the professor’s power in the class, which is believed to be wielded inconsistently, the anxious student can obtain confidence or magical help by utilizing a belief system that has been in existence for hundreds of years. In a similar way, members of hazardous occupations (like deep-sea fishermen and

firefighters) adopt the beliefs and customs passed on by several generations of coworkers, thus availing themselves of an accumulation of experience, know-how, and psychological aids that they do not have time to discover on their own before being in danger.

Student customs extend far beyond the issues of academic anxiety, however. Collectors of student folklore have noted extensive drinking games (“Cardinal Puff,” “Fuzz-Buzz”), theme parties, engagement and marriage rituals (passing a candle around a group of sorority women to announce an engagement), clothing and personal-decoration variations (especially at sports events and at graduation), and the use of obscene songs as unofficial expressions of membership in clubs, fraternities, sororities, and sports teams (especially rugby). At Utah State University (formerly an agricultural college), a student becomes a True Aggie by standing on a small concrete monument formed in the shape of an A and being kissed by someone who is already a True Aggie, at midnight, while the bell in nearby Old Main tolls the hour, preferably on a full moon, and preferably on Homecoming Saturday. It is rumored that another more complex and private ritual produces a “True Blue Aggie,” but its details have remained in the dark. At other universities, gates, statues, and fountains are the focal points of similar rituals and observances.

The folk speech of university students abounds with terms that mark the users as insiders: “cutting” or “sluffing” for intentionally missing a class, “cramming” for earnest studying, “Mickey” or “Mickey Mouse” to describe an easy course, “ballbuster” for a difficult course, “brown-nose” for a teacher’s pet. Terms like “comps,” “finals,” “defense,” “How much of a load are you carrying?” “What’s your GPA?” and the like are readily understood on campus but are usually unintelligible to anyone not a part of the academic group.

Academic legends (stories told as true, but not by someone who was an eyewitness) recall prudish deans of the 1950s who prohibited red dresses and patent leather shoes (responding to overzealous interpretations of *in loco parentis*), obscene or crazy comments by professors in their classes, epic pranks (like the dead horse in the fraternity cellar), and spectacular feats of cheating on final examinations. Professorial arrogance is parodied in the legend of the lecturer who notices most of his students using tape recorders so they won’t have to take notes; he responds by sending a graduate assistant to play tapes to them so he will not have to lecture. An absentminded biology professor, getting ready to dissect a frog, pulls out of his backpack the sandwich he thought he ate at lunch. Students playing recordings backward discover satanic messages or hypnotic orders that lead them to suicide (in joking response, other students claim to have played a record of the Mormon Tabernacle Choir backward, obtaining twenty new recipes for Jello salad).

Pranks are another important genre of academic folklore, though it is not always clear whether the pranks actually are carried out, or if they are simply parts of the oral traditions of campus groups. One hears about well-fed cows being left overnight in the offices of unpopular professors and about the dean’s car being taken apart and reassembled on the roof of the administration building, but it is easier to find avid narrators than eyewitnesses to these events. Modern legends of student hackers gaining access to academic records and changing friends’ grades are matched by newspaper accounts of people who have been caught doing it.

Faculty folklore focuses more on the humor, irony, and occasional disappointments in the life behind the lectern than it does on anxiety and fun. Although there are some jokes about students—like the young woman who says she will “do anything” for a grade and is then told by the professor to try studying, or the joke about the student who almost chokes to death trying to swallow his “crib notes” at an examination—professional traditions complain about the devices used for cheating on exams, the range of excuses given for being absent (it is noted cynically that final examination week is extremely dangerous for the elderly, since so many grandmothers die then), and the unwillingness of students to learn (teaching is characterized as “casting fake pearls before real swine”).

As much as anything, faculty members both instigate and utilize much of the folklore circulating among their students, very likely because they were also students in a previous life. When a professor is late for class, she can be sure that the students will wait for at least ten minutes before daring to leave. If a professor wants to intimidate or astound the students, he can quote from tradition, as when a University of Oregon English professor asked the women in his Milton class to cross their legs so that the gates of Hell would be closed when they discussed *Paradise Lost*, using a legend he had heard at his own alma mater when he was a student. A music professor at the University of Utah waited until the critical moment (was it twenty minutes?) when his students were about to leave the room, then ceremoniously stepped out of the grand piano while beginning his initial lecture.

Folklore is not found only among the backward, illiterate, and uninformed; it is a vital expressive component in the lives of all ongoing human groups. Academic folklore is a dynamic illustration of the ways in which folklore functions for modern, well-educated, upwardly mobile people whose occupational context places them under particular strains and concerns that are well articulated on the vernacular level.

Academic Programs in Folklore

Folklore programs in the United States and Canada. Folklore courses were introduced at several North American universities in the 1920s and 1930s, and in 1940 Ralph Steele Boggs established the first degree-granting program in folklore, at the University of North Carolina at Chapel Hill, which remains a center for the study of folklore. Awarding both an M.A. degree and a doctoral minor, the curriculum in folklore at North Carolina is designed primarily for graduate students, though undergraduates may create an interdisciplinary degree with a concentration in folklore. Supported by several research collections—including D.K.Wilgus' papers, Archie Green's labor-song collection, the Southern Folklife Collection, the John Edwards Memorial Collection, the American Religious Tunebook Collection, and the Southern Historical Collection—the North Carolina program is especially strong in folksong and Southern folklife studies. Other emphases include African American folklore, ethnographic filmmaking, public-sector folklore, and occupational folklore.

The first Folklore Department in an American college or university was established at Franklin and Marshall University in 1948 by Alfred L. Shoemaker, assistant professor of American folklore. Although called the Department of American Folklore, the program was influenced by European folklife concepts and emphasized the study of Pennsylvania folklore and folklife. Franklin and Marshall's short-lived Folklore Department first appeared in the catalog for 1949–1950 but remained in it only two years. By 1995, Franklin and Marshall offered only a single folklore course, and in the United States only Indiana University and the University of Pennsylvania had Folklore Departments.

Stith Thompson joined the English faculty at Indiana University as director of freshman composition in 1921 and introduced the first folklore course there in 1923. After directing several M.A. theses and doctoral dissertations in folklore for graduate students majoring in English, Thompson established the first American Ph.D. program in folklore, at Indiana in 1949. After Thompson's retirement in 1955, his successor, Richard M. Dorson, guided an expanded folklore program of courses and faculty to departmental status in 1963. Under Thompson's direction, the program emphasized the comparative study of international folktales. Dorson continued to stress coverage of major international cultural areas in the curriculum, but, trained in the history of American civilization, he also added an Americanist orientation to the program. Warren E. Roberts, in 1953 the recipient of the first American doctorate in folklore, introduced a course in traditional arts, crafts, and architecture in 1961 and contributed to widening the range of the Indiana program, which emphasizes theoretical approaches in covering the entire field of folklore studies. An ethnomusicology program within the Department of Folklore and an Archives of Traditional Music strengthen the B.A. program as well as the M.A. and Ph.D. programs in folklore.

The second doctoral program in folklore was established in 1959, at the University of Pennsylvania, by Mac-Edward Leach. Leach remained on the English faculty at Penn after receiving a Ph.D. in Middle English literature there in 1930 and changed two

literature courses into a general folklore course and a ballad course. Penn's interdisciplinary graduate program in folklore first emphasized studies in ballads and folksongs and in folklore and literary relations, but by the time Leach retired in 1966, Penn had a comprehensive program covering the entire range of folklore studies. Influenced by sociolinguistic approaches and the ethnography of communication, the Department of Folklore and Folklife, offering an undergraduate degree and an M.A. in folklore as well as a doctorate, stresses social-scientific approaches to folklore.

Another major center of folklore studies is the folklore and mythology program at the University of California at Los Angeles, where Sigurd B. Hustvedt introduced a graduate course in the traditional ballad in 1933. Wayland D. Hand joined the German faculty in 1937, introduced a general folklore course in 1939, and established an interdepartmental folklore program in 1954. By 1995, UCLA's folklore and mythology program offered more than seventy-five courses, either directly or in conjunction with cooperating departments throughout the university, and awarded interdisciplinary master's and doctoral degrees in folklore and mythology. A research institute, the Center for the Study of Comparative Folklore and Mythology, and other university research centers strengthen UCLA's academic program.

An M.A. in folklore is offered in the Department of Anthropology at the University of California at Berkeley, and an M.A. in folk arts is offered through the Tamburitzans Institute of Folk Arts in the School of Music at Duquesne University. Western Kentucky's program in folk studies, housed in the Department of Modern Languages and Intercultural Studies, offers an undergraduate minor as well as an M.A. degree in folk studies. In Canada, Memorial University of Newfoundland and Université Laval have folklore programs, both awarding doctoral, master's, and undergraduate degrees in folklore. In 1962 Herbert Halpert joined the faculty of Memorial and, encouraged and supported by E.R. Seary, professor and head of the Department of English and place-names scholar, developed a folklore program within the Department of English. In 1968 Halpert established a Department of Folklore that offers a complete line of folklore courses. Three archives support the teaching mission: the *Centre d'études franco-terreneuviennes*, the Centre for Material Culture Studies, and the Folklore and Language Archive. Université Laval, with folklore studies dating from 1944 when Luc Lacourcière was appointed to a chair in folklore, offers undergraduate and graduate degrees in folklore, with emphasis on French folklore in North America, through its *programmes d'arts et traditions populaires* in the *Département d'Histoire*.

Two institutions without formal graduate programs in folklore, Pitzer College and Harvard University, offer B.A. degrees in folklore. Folklore studies at Harvard date from 1856 when Francis James Child began collecting English and Scottish folk ballads from books, broadsides, and manuscripts. Child did not develop separate folklore courses or a folklore program, but he incorporated folklore in his English courses and trained several notable American folklorists, including George Lyman Kittredge, successor to Child's English professorship in 1894. Harvard became the center for the literary study of folklore in North America in the late 19th and early 20th centuries, and the interest in folklore at Harvard was maintained in the 1930s by a group of Americanists, who promoted an interdisciplinary study of American culture to include folk and popular cultures as well as formal culture, and by Milman Parry and Albert Bates Lord, who initiated field research in European oral epics. Harvard remains a center for the

comparative study of folklore, because graduate studies in oral literature in allied areas complement Harvard's undergraduate degree program in folklore and mythology, awarded through its Committee on Degrees in Folklore and Mythology.

Over eighty North American colleges and universities offer majors in other disciplines (notably English, anthropology, and American studies) that permit a folklore minor or concentration. These programs range from formal curricula to informal concentrations at all degree levels. For example, an M.A. and a Ph.D. in anthropology or English with a folklore concentration is offered at the University of Texas at Austin. Undergraduate majors as well as graduate majors in anthropology at Texas A&M University also may elect a concentration in folklore. Degrees in folklore at the University of Oregon are coordinated through its folklore and ethnic studies program, in which master's students create their own program of study through an individualized program and doctoral students in English or anthropology may elect folklore as an area of concentration. Through its program in folklore, mythology, and film studies, the State University of New York at Buffalo awards an M.A. in English or humanities and a Ph.D. in English with a folklore and mythology concentration. A concentration in folklore also is available in the Department of Performance Studies at New York University.

George Washington University's folklife program grants an M.A. in American studies or anthropology and a Ph.D. in American studies with a concentration in traditional material culture—a program that takes advantage of the resources of the Smithsonian Institution, the American Folklife Center, and other museums, libraries, archives, and historical societies in the Washington, DC, area. The folklore program at Utah State University is administered through the American studies program, and undergraduate and master's degrees in American studies with a folklore emphasis are offered. Folklore concentrations also are available to history or English majors at Utah State. Master's candidates may elect areas in general folklore, public folklore, or applied history/museology. Ohio State University has offered folklore courses since the 1930s and has a Center for Folklore and Cultural Studies, allowing undergraduate and graduate students a folklore concentration in an interdisciplinary program, which emphasizes folklore and literary relations and narrative theory.

The academic study of folklore has made considerable progress since Boggs established the first folklore program in 1940, but few degree-granting programs in folklore have developed. Most folklore courses are taught in departments other than folklore, typically in English and anthropology departments or in American studies programs in the United States and in anthropology and history departments in Canada.

Adirondacks

A five-million acre, mountainous region in northeastern New York, bounded on the north by the Canadian border, on the east by Lake Champlain, on the south by the Mohawk River Valley, and on the west by the Saint Lawrence and Black River Valleys. The Adirondack Mountains constitute part of the Canadian Shield and are not, as popularly perceived, a part of the Appalachian Mountains. About half of the 5,177 square miles is a state forest preserve; much of the area has been designated a state park since 1892, thus limiting development. To many New Yorkers, the region is simply referred to as the “North Country.”

The term “Adirondack” is a lexicographer’s nightmare. Authorities offer a variety of translations. It is said to be (1) Iroquois for “They of the Great Rock,” referring to a tribe of Indians who once lived along the Saint Lawrence River; (2) a Mohawk generic name for the French and the English; or (3) Mohawk for “tree-eaters,” the derisive term that Mohawks, or Iroquois as the French called them, used to describe their enemy, the Algonquins. Before European contact, both tribes vied for control of the region because its forests and numerous lakes and streams provided a good source for meat and furs. Trails crisscrossed the region linking its numerous lakes and also to the Saint Lawrence, but there is little evidence of any Native American permanent settlements beyond seasonal camps.

European contact is generally dated from 1609, when the French explorer Samuel de Champlain accompanied an Algonquin war party on its way to attack an Iroquois village on what eventually became known as Lake George. Later in the same century, French and Dutch trappers from Montreal and Albany forayed into the region, but they did not establish permanent communities.

After the American Revolution, however, Vermonters, in particular, and other New Englanders, many of whom received land as payment for their military service, settled around the edges of the Adirondacks. Shortly thereafter, toward the end of the 18th century, logging in the eastern Adirondack region, along the headwaters of the Hudson River, stimulated settlement and development.

The southern Adirondack region would experience growth from a different source. By the late 1810s, tourists from New York City and Boston discovered the recreational value of the Adirondacks. The mineral waters found near Saratoga Springs drew crowds desiring to bathe in and drink the radioactive mineral waters, believing that the natural springs offered cures for numerous ailments. Equally alluring were fishing and hunting within the Adirondack Mountains. The pursuit of health and outdoor recreation provided the bases for a tourist industry that shaped much of the development and settlement patterns in the southern Adirondacks. By the 1840s and 1850s, hotels and rustic “camps” had sprung up throughout the southern Adirondack region. The growth mushroomed so quickly that shortly after the Civil War conservationists banded together in efforts to protect the tourist industry from logging interests that were encroaching from the northern Adirondacks. The heyday of tourism spanned more than three decades, from

1875 to 1910. In 1900, for example, a quarter of a million people visited the Adirondacks in the summer months alone. Many of these either rented camps, stayed in luxurious hotels, or vacationed in their own camp.

In the late 1870s, the area around Saranac Lake began to be touted for its healthy air. Medical doctors recommended extended stays in the region for the treatment of tuberculosis and other lung diseases. Numerous sanatoriums were constructed around the village, drawing thousands of famous and obscure patients, all seeking to breathe the curing Adirondack air.

Out of the tourist industry developed a folk tradition centering on the exploits and heroism of the Adirondack guide. The earliest guides, such as Sabael (ca. 1749–1855) or Mitchell Sabattis (1801–1906) were Abenakis. Local lore and some ethnographic research attributes Native Americans living in the region with producing both the Adirondack guide canoe and the Adirondack packbasket, two important items of Adirondack material culture that are rooted in Abenaki tradition. Eventually, Native American guides were replaced by White guides, some of whom were originally loggers or trappers. Other guides claimed to lead the life of outdoor hermits who spent their entire lives exploring the peaks and rivers of the region. Familiarity with the backwoods country allowed the guides to lead city tourists deep into the Adirondack forests on camping, hunting, mountain climbing, and fishing trips. The 19th-century Romantic impulse of educated city folk to touch the primordial world was adequately served by these guides. In some cases, these stalwart outdoorsman took on the additional responsibility of camping throughout the winter in a tent or an isolated camp helping a tubercular-ridden invalid strengthen his or her lungs and physical stamina, hoping to overcome the dreaded disease.

Popular narratives of the day described how these mountainmen-guides entertained their guests with outlandish tales about their marksmanship and hunting skills. Folk tradition continues to keep alive the memory of Native American and White guides, including among the latter the famous guide Mart Moody (1833–1910). Tales about his outdoor skills and eccentricities are shared among visitors and natives, and they have found their way into local literature, becoming part of the regional lore. The oral traditions about the older guides have become part of the narrative repertory of contemporary guides, and, in some instances, the older tales are even retold in the first person by the present generation of guides.

Despite the surge in tourism and health industries in the second half of 19th century, the interior of the Adirondacks remained largely unexplored. Accurate maps of the whole region were not available until the 1890s. It remained for the Gilded Age a wilderness, a place of mystery that offered potential adventures in uncharted regions. While popular urban icons of the age such as Diamond Jim Brady and Lillian Russell spent their time at the racetrack and spas in Saratoga, only a few miles away an area lay untouched that offered the more adventurous the thrill of visiting an uncharted wilderness.

The northern and western borderlands of the Adirondacks are marked with a very different history of settlement and development. Logging stimulated movement into the region. Vast tracts of pine and hardwood had attracted Canadian lumber interests as early as the mid-18th century when French Canadian loggers harvested the forests along the northwestern fringes of the Adirondacks and floated logs north to the Saint Lawrence River and Montreal. The work was handlabor intensive, but the promise of a job lured

many French Canadian lumbermen and lumberjacks to settle along with their families in the northern and western edges of the Adirondack region. As the industry moved deeper into the mountains in search of more timber, the workers and their families followed, gradually establishing small communities along the rivers and edges of the many lakes. There they cut white pine and either sawed it into timber to be transported south on railroad spurs or floated the logs north to the Saint Lawrence, where they became part of the Canadian market. Despite the efforts of conservationists to block logging throughout the Adirondacks, intensive commercial logging swept across the region. By the early 20th century, logging and several major forest fires had depleted the virgin forests, but many of the workers stayed behind, working in much smaller logging operations that harvested a second growth.

Small communities scattered throughout the region developed chiefly in response to logging, although a few sprung up where there were small-scale iron- or lead-mining interests. The Lake Placid-Lake George-Lake Saranac region developed a skiing industry and has hosted the Winter Olympics on two occasions. Along the western foothills of the Adirondacks, dairy farming emerged as the major industry. In some parts of the region, potato farming, fruit growing and other small cash crop farming developed. The central region, dotted by very small communities, continues for the most part to cater to tourists.

Folklore for the entire Adirondack region has never been comprehensively and systematically collected, although independent researchers have published a moderate range of material about specific counties or occupations in the Adirondacks. These studies suggest that a rich lode of folk traditions might be found in the region.

Native American material is sparsely represented in any collections and appears most frequently in older, uncritical publications. Hoping to appeal to the interests of tourists, some published accounts of local history contain examples of folk speech, proverbs, or tales about eccentric characters and bizarre occurrences. Personal narratives about roughing it in the woods appear alongside traditional tall tales describing the struggles to survive the onslaught of hordes of black flies and voracious mosquitoes or accounts of the superhuman skills of hunters. Along the eastern Adirondacks that border Lake Champlain, 19th-century eyewitness reports, publicized by local tourist interests, provide a historical setting for Lake Champlain monster sightings, a tradition that continues to intrigue tourists and local citizens. Other popularizers have sought to create belief in a Bigfoot-like creature living in the remote recesses of the Adirondacks.

Ethnic humor about the perceived idiosyncracies of French Canadians are commonly told by Adirondack folk. "Canucks" worked in the woods, and their difficulties with the language and the local customs of the dominant Anglo American culture provided situations for local humor and dialect tales. Even in the late 20th century, humor about the French Canadian shoppers and their efforts to avoid paying duty on items purchased in the States constitutes a viable theme in Adirondack and border humor.

The richest body of lore yet tapped in the Adirondacks is from the region's robust logging traditions. The oral recollections of the modern loggers and of the older native population in general are rich in both grass-roots history and folklore of logging. Personal-experience tales mix with traditional tall-tale motifs; the old lifestyles in the logging camps are recalled with nostalgia. Idioms of folk speech still spice the conversations of the men who spent much of their early life working in the bush and living in the camps. With ease, they can recall how, in the evenings, as the exhausted

loggers gathered in the “doghouse” (the center of the bunkhouse), the loaders, road hogs, teamsters, and jacks pushed aside their “turkeys” (tightly rolled bundles of clothes) and sat down on “deacon’s benches” to swap lies.

Especially prized are tales about the prodigious strength and extraordinary skills of lumberjacks, about marvelous rescues from the dangers of logging, and about accidental injury and death. In cycles of stories, eccentric crew foremen and backwoods strongmen mature into local villains and heroes. Yarns are woven about the dictatorial policies of cooks who demanded total obedience to the unwritten codes of bunkhouse decorum. Many narratives recount practical jokes that initiated unwitting greenhorns into the world of the lumberman or that undermined the authority of a tyrannical foreman. Barroom brawls, which are often the result of grudges that fester in the logging camps or on the job, become sagas peppered with violence and brutality.

In addition to swapping stories, the loggers maintained a rich singing tradition. Ballads such as “The Saranac River” or “Blue Mountain Lake” chronicle the work experiences of local lumbermen. “Tebo” tells how Tebo died while breaking a log jam. But these songs appear to be no more or less popular than such migratory lumber songs as the sentimental “Jam on Gerry’s Rock” or “Lumberman’s Alphabet.” Many of the logging songs collected in the Adirondacks are localized versions of songs that can be found throughout the United States and Canada, wherever the axes of the lumbermen rang through the forests. Collectors in this century also have found a rich tradition of Anglo, Anglo Irish, and French Canadian ballads existing alongside these American logging ballads.

Efforts at revitalizing or maintaining some of the Adirondack folklife traditions seek to tap tourist dollars and to educate local people and visitors about Adirondack life. Woodcrafts, ranging from whittling pine chains, to weaving baskets that recapture traditional Native American patterns, to producing Adirondack chairs and canoes, provide glimpses of traditions that a few years ago could be found only in museums. Oral traditions, especially folksongs, are performed at folk festivals held during the summer and fall months throughout the Adirondacks. Several museums featuring examples of Adirondack folklife, including both arts and crafts, are open to the public. These public events and displays provide new audiences for the traditions of the Adirondacks.

African Americans

Known as American Negroes in 1888 when the American Folklore Society (AFS) identified those American ethnic groups whose unique cultural traditions should be documented and preserved. Much debate ensued over the label attached to this group, which presently comprises between 11 and 12 percent of the total U.S. population. As was customary during the late 19th century, the founders of the AFS used the Spanish-derived title “Negro.” However, pejoratives such as “darker,” “nigger,” and “coon” were not uncommon vernacular labels during that era and were often used unashamedly. Turn of the century activist Ida B. Wells-Barnett and her colleagues made the case that “Afro-American” ought to be adopted by the American population. For many, the designation “colored” was considered a polite and acceptable label until the 1960s. In the heyday of the modern civil rights movement, the label “Black” became the one accepted by many members of the group. This name appealed to those who felt that peoples of African descent should embrace their dark complexions and African physical features. Of course, several centuries of mixing between the various ethnic groups of the United States meant that a wide range of skin tones, facial features, and body types were evident in this population. By the 1980s, many began to prefer a designation that specified the country of origin. Since then, “African American” has been the preferred label.

The founders of the American Folklore Society connected Negro folklore with the institution of slavery. They rationalized that efforts to collect Negro folklore must be undertaken before all of those who had experienced slavery died. The presumption seems to have been that traces of slave tradition would not be evident in the repertoires of the descendents of slaves. But even before the formation of the American Folklore Society, African American folklore had aroused the interest of a few talented persons. In particular, the musical traditions of the slaves had triggered the curiosity of individuals such as Lucy McKim Garrison and Thomas Wentworth Higginson, who published collections containing Negro folk music in the 1860s.

Journalist Joel Chandler Harris’ fascination with the folktales he had heard as a child led him to publish seven volumes of folktales featuring the exploits of Brer Rabbit, Brer Fox, Brer Alligator, and numerous other animal characters. Three additional volumes were published after Harris’ death in 1908. Known as trickster tales, these narratives suggest that the slaves identified with ostensibly powerless heroes who used their verbal dexterity, cunning, and verve to outwit larger, more obviously powerful opponents. Such tales served to educate and entertain African Americans of all ages. Trickster tales and other folk narratives continued to be important to African Americans long after the demise of slavery.

Most late 19th- and early 20th-century folklore research took place in Southern environs. In particular, a chain of islands along the coasts of Georgia and South Carolina known as the Sea Islands proved to be a rich region for fieldwork. Once a popular destination point for slave ships, these islands were inhabited by large numbers of Blacks whose connections with Africa were stronger than those of Blacks elsewhere in the United States. Until well into the 20th century, residents of the Sea Islands spoke distinctive dialects—gullah and geechee—clearly derived from West African language

systems. In addition their verbal traditions, their material culture—house types, gardens, textiles, and like artifacts—reflect strong Caribbean and African influences.

In the first decades of the 20th century, the field of folklore began to attract a few trained African American folklorists. Because Black informants were more apt to reveal provocative texts to other blacks, this was a particularly welcome development. The works of Thomas Washington Talley and Arthur Huff Fauset laid significant groundwork for future Black folklorists. However, of the early 20th-century Black folklorists, Zora Neale Hurston emerges as the most significant innovator. In her landmark text *Mules and Men* (1935), she included contextual information as well as the actual tales recited by her rural Black informants. During the folk-belief phase of research for this volume, she underwent the rituals necessary to become a voodoo priestess in New Orleans. Although her creative output was not limited to folklore per se, all of her literary endeavors reflected her appreciation for folklore.

Starting with the Harlem Renaissance, several African American literary figures dabbled in folklore collecting and research. Celebrated poet Langston Hughes published a lengthy volume on Negro folklore. His collection of short stories on the trials and tribulations of Jesse B. Semple contains prodigious quantities of Black folk speech. Most important African American novelists have expressed a profound debt to folklore. Literary giant Ralph Ellison relied heavily on African American folklore in his masterpiece *Invisible Man*, and later in the 20th century, Toni Morrison, Alice Walker, and Terry McMillan acknowledged their reliance on folklore materials for their short stories and novels.

In the 1930s, the Works Progress Administration (WPA) created jobs for unemployed writers and teachers that entailed fieldwork collecting folklore and life histories from elderly ex-slaves. Coordinated by Benjamin A. Botkin, the project was an enormous one, yielding thousands of interviews. Many of the collectors had no formal training and were unaccustomed to thinking of Black traditions as worthy of respect. Rather than quoting the informants word for word, the untrained collectors summarized the tales in their own words. Still, the narratives contain a wealth of information unduplicated in other sources. Responsible folklorists are careful to acknowledge the collecting irregularities when using this data.

From spirituals to gospel, from field hollers to rap, the wide range of African American sacred and secular musical expression has long intrigued folklorists and ethnomusicologists. Like their African ancestors, African Americans considered music an essential component of everyday life. In most African communities, composing and performing music appropriate for each activity was an integral part of spiritual expression. The African impulse to produce and perform music survived the horrendous strains of the Middle Passage and became a mainstay of New World African Americans, who wove their own musical styles with those they heard from the masters. During the slavery era, the slaves' musical aptitude was duly noted by the master class. Thus was born the still pervasive stereotype that holds that Blacks are born musicians who possess "natural rhythm." Slaves are credited with introducing percussion instruments and a forerunner of the banjo with them to the New World. Polyrhythms, frequent use of percussion instruments and antiphonal or call-and-response patterns are distinctive features of African American folk musical expression.

Few academic debates proved more resilient than the one over “survivals” in African American folklore. Whether it is the rhythm of the music, the arrangement of blocks in a quilt, the personality of a hero in a narrative, the first question asked is often, “Where did it come from—Africa or Europe?” In the first decades of folklore research, it was widely assumed that

the Middle Passage—the brutal interim spent aboard slave ships between Africa and the Americas—combined with the devastating impact of the seasoning years, had eradicated all traces of African culture from the psyches of slaves, rendering them cultural blank slates. Advocates of this position maintained that slave lore was derived from inept, clumsy imitations of the European forms to which the slaves were exposed. However, as researchers began to scrutinize West African cultures, common denominators between African and African American folklore became increasingly apparent. Africanist William R. Bascom noted numerous motifs and tale types common to West African folktales. Folk-speech specialists such as Lorenzo D. Turner identified many African words and idioms within the English spoken by both White and Black Americans. For folk-music authorities, the emphasis on call-and-response structure and the polyrhythmic organization of African American musical expression signaled its connection to West African types.

Of course, European influences on African American folklore are undeniable. English is the first language of African Americans and, like their African ancestors, African Americans enjoy and value imitation. By the same token, the folklore traditions of Americans of European descent reflect borrowings from Black traditions. Most folklorists agree that African American folk traditions are syncretized. Blacks have retained many West African aesthetic principles and wedded them to those from other cultures to which they have been exposed. The songs, narratives, jokes, rituals, beliefs, and so forth that result are intrinsically African American.

Throughout the late 19th century and well into the 20th, African Americans migrated from rural Southern roads to urban Northern streets. Folklore continued to function as an essential expression of everyday Black life. Older genres were modified to fit city environments. Bluesmen frequently replaced acoustic instruments with electric ones, and lyrics focused on the challenges posed by urban industrial life. Quilters modified their techniques to include sewing machines. Worship services took place in storefront churches rather than in pine-board ones. Thus, urban life altered but did not diminish the importance of folklore.

African Americans celebrate verbal versatility and have employed a variety of modes of verbal communication to express themselves. Children are urged to hone their oratorical abilities. Girls often begin by chanting the intricate rhymes that accompany “Double-Dutch” jump-roping sessions. Boys and many girls develop their skills by participating in ritual insult-swapping sessions known as “playing the dozens.” In some circles, sophisticated verbal artistry is conveyed in toasts—lengthy epic poems featuring the escapades of unlikely Black heroes. Other familiar genres of African American folk speech include signifyin’, capping, rapping, loud-talking, and marking. Friendly competition is often the hallmark of these forms as individuals vie for respect by showing off their verbal prowess.

Contemporary legends and rumors are as common among African Americans as they are within the dominant culture. Some cycles, like the Kentucky Fried Rat and the mouse in the Coke bottle, are well known by both Blacks and Whites. But cycles specific to the concerns of African Americans have evolved and are well contained within the group. Businesses that have unorthodox advertising practices and symbolically charged products are often identified in these legends. The notion that “the government” constructs elaborate anti-Black conspiracies is often promoted.

Not all scrutiny of African American folklore has been on verbal forms. In the past several decades, many folklorists have turned their attention to material culture, in particular house types and quilts. Throughout African American rural communities, shotgun houses have been cataloged. The floor plans for these houses line up a back exit behind a front entrance with no wall or structural interference between the two doors. Thus, it is said that if a shot was fired from either the front or rear of the house, the bullet would go straight through, without lodging in the home. These houses are remarkably similar to structures found in many West African communities. There the folk explanation for the floor plan maintains that if the spirit of an ancestor wanders into the home, it will wander out the other side without getting trapped within. Many quilts made by African American women and men vary a great deal from other American quilts. Like many kinds of West African textiles, long, rectangular strips dominate many of the quilts. Conventional symmetry in which a shape or a color is balanced on one side by the same

shape or color on the other seems to be less important to African American quilters than to other quilters. Many Black quilters prefer to fool the eye by knowingly constructing asymmetrical arrangements. Synthetic fabrics are used more often in African American quilts than in mainstream quilts, and red is the most frequently used color. Academic attention to African American material culture has triggered interest in the art world. African American quilts, baskets, sculpture, and other artifacts are found and sold in the finest museums and galleries.

African American spiritual life has always been a rich source of folklore. During the slavery era, African Americans combined West African and Caribbean folk-belief practices with Christian beliefs. A system of folk belief known as conjure or hoodoo evolved in many Southern locales. Believers presumed that conjure doctors understood how to use powers contained in nature, and some conjure doctors were accorded the same respect as preachers. Conjure or hoodoo are sometimes confused with voodoo, which is akin to *voudou* in Haiti. These belief systems stem from Dahomean (present-day Nigeria) sacred practices. Dahomeans traded into slavery were transported to Haiti. Some of these slaves were then traded to New Orleans. Voodoo is an enormously complex system centered on root work and snake worship. In voodoo as well as *santeria* (Cuba and the United States), *candomble* (Brazil and the United States), and *shango* (Trinidad and the United States), African religious principles are syncretized with Christian principles.

More conventional Christian worship is also common in African American communities. Folklorists have been particularly interested in the delivery styles of African American preachers and the status afforded the congregation. African American congregations actively participate in all aspects of the worship service. Preachers frequently chant their sermons, all the while soliciting affirmation and testimony from their listeners. A lively, vocal congregation is the sign of a successful preacher.

Young African Americans often complain about the speed at which the population at large appropriates appealing Black folk expression. Music, clothing, dance styles, and art forms shaped by African Americans are soon adopted by the dominant culture. However, the impulse to transform and invent folk expression is a strong one, and African Americans, like all folk groups, will continue to enjoy an exciting folk culture.

Aging, Folklore and

Traditional expressive culture created around the experience of growing old. During the 1970s, an area of shared interest opened for gerontologists and folklorists, as many in the social sciences abandoned explanatory, scientific paradigms of aging in favor of interpretive approaches. Gerontologists, in search of predictable patterns and processes, theorized aging largely as a social problem: The elderly “disengage” by mutual agreement (disengagement theory), or they actively resist disengagement (activity theory), or they form a discrete subculture in an age-stratified society (subculture theory), or they undergo identity crises, precipitated by the loss of former roles (identity crisis theory) (Mullen 1992:10–13). Folklorists, on the other hand, had long assembled collections—of ballads, riddles, tales, and tunes—from the memories of elders, little heeding a pattern linking the culture collected to an elderly consultant’s position in the life cycle.

As phenomenological perspectives gained ground in the social sciences, folklorists began to attend more carefully to contexts for performance and collection, and gerontologists, shelving the quest for predictable patterns, began to explore how the elderly construct and interpret their own experience. A mutually engaging domain for folklorists and gerontologists has been opened up by questions about how societies constitute the life cycle through culture, how and why intergenerational communication is staged, and what kinds of culture elders create around the experience of growing old.

The Social and Cultural Organization of Aging

Ways of thinking about and dividing up the life cycle vary over time and across cultures. Folklore generated in America about this progression articulates and comments upon “stages” of life. Anticipating life’s stages, children recite them in rhymes and songs: “Solomon Grundy, born on Monday/Christened on Tuesday/Married on Wednesday...” or “When I was a baby, a baby, a baby, when I was a baby, this is what I did,” which continues through grandmotherhood and death (Hufford, Hunt, and Zeitlin 1987:18). Reflecting on those stages, elders hone hindsight into aphorism: “If you’re twenty and not a revolutionary, you have no heart. If you’re forty and a revolutionary, you have no mind” or “A fox is smart because he is old, not because he is a fox” or “Snow on the roof doesn’t mean there’s no fire in the furnace.” These fragments hint at multigenerational perspectives on the life cycle, and an underlying ever-present negotiation of the elder’s image and role in society.

Biological and social milestones formally separate and define phases of life. Out of tradition, history, personal experience and social relationships, communities fashion rites of passage to signal or precipitate transitions from one stage of life to another: the christening or bris (circumcision rite), the bar mitzvah or confirmation, the graduation, the driver's license, the wedding, the divorce, the baby shower, the retirement banquet, the funeral and associated rituals. Displaying knowledge about nature and society, such rites socially redefine the person passing from preschool to school age, childhood to adolescence, single to married state (and vice versa), career to retirement, life to death.

The notion of the milestone implies gradual progression, or "development," toward a goal. Around experiences common to each stage of life people create and master expressive forms that social scientists have related to "developmental" tasks. Through such cultural practices as jumping rope, children develop physical coordination, social skills, and cognitive proficiency. Children riddling come to terms with cultural categories and learn that the conceptual frames holding reality in place are manipulable. Adolescents on the threshold of greater social responsibility dramatize their concerns in frightening stories about baby-sitting and dating, or through humor about sexuality. Adults in what psychologist Eric Erikson terms their "generative" phase engage again with the early stages of life, but this time from the perspective of parents, teachers, or supervisors, shaping out of symbolic repertoires new realms of lore and custom: bedtime rituals, occupational rites of initiation, narratives of birth and delivery, and ways of celebrating anniversaries, birthdays, and holidays. Throughout this period of life, as physical abilities peak and decline, proficiency with symbolic resources like proverb, narrative, and ritual is apt to increase.

The transition from the social roles and experiences generally associated with mid-life to those associated with old age does not happen automatically or abruptly. Though distinguished by certain kinds of events—the retirement banquet, the birth of grandchildren, the fiftieth high school reunion, the golden jubilee—old age is experienced by many as "one of the great unrealizables," in the words of Simone de Beauvoir. However, the accumulation of experiences common to old age, such as loss of loved ones and diminishing physical abilities, are also linked with cultural practices distinctive to that stage in life, including reminiscing and the rendering of long memories into tangible form.

Reminiscing, a logical practice for those with the longest memories, was until recent decades discouraged in the elderly, because it seemed to betoken a desire to disengage from the present and dwell in the past. However, research since the 1960s suggests that: (1) reviewing one's memories is essential to a major developmental task in later years: life integration (Butler 1968); and (2) folklore is a resource used by elders to give meaning to their lives (Bronner 1984; Hufford, Hunt, and Zeitlin 1987; Kirshenblatt-Gimblett 1989a, 1989b; Mullen 1992). In addition to recasting our perceptions of culture created by elders, this insight has tremendous implications for the practice of folklore, which has traditionally relied on the memories of elderly informants.

The Elderly as Culture Makers

Certain kinds of experience distinguish the elderly from those in earlier stages of life and form the basis for the creation of culture—material, verbal, and ritual—that is distinctive to elders. Looming large in later life is the experience of discontinuity. Ruptures of various kinds cast the social and biological terrain into disarray: the deaths of loved ones and acquaintances, the loss of physical ability, the severance from agendas that held childhood and mid-life in place. Many cultural practices of the elderly—the crafting of new routines, the sociality achieved in senior centers, the revival of skills or traditions acquired in youth—appear especially designed to mend such breaches.

Another experience, shared only with members of one's generational "cohort," is that of having entered the stream of history at the same time and experiencing pivotal moments from a shared position in the life cycle—a position historically unique to that generation. Having participated in history from the same position in the life cycle, elderly contemporaries share understandings to which younger generations are not privy, and these shared understandings and memories are a resource that the culture elders produce with and for each other. Some studies have looked at how elders use tradition to craft sociality: elderly Italian men playing bocce ball (Mathias 1974); Mexicano *viejos* giving voice to elders of bygone days (*viejos*) through *la platica de los viejitos de antes* (Briggs 1988); Hungarian raconteurs fitting personal experiences into traditional tale types over the telephone (Degh 1969); older women collaborating on quilts that embody overlapping biographies (Beck 1982); jokes and narratives exchanged—over a game of cards or pool or on a tour bus—about memory lapses or other physical problems ("organ recitals," in a coin of Mayer Kirshenblatt) (Hufford, Hunt, and Zeitlin 1987:32). Thus engaging each other, shaping and affirming their generation's reality, elders bestow form and meaning on the inchoate and disquieting aspects of old age. The culture they create defends against isolation and discontinuity, stitching together a community as it gathers disjunct moments in history into a coherent whole.

A related experience is the capacity to see the world from the perspective of multiple generations. "At eighty you can be the age of whoever you talk to," said Ethel Mohammed of Belzoni, Mississippi, when in her eighties (Hufford, Hunt, and Zeitlin 1987:27). "I am all ages simultaneously," wrote Bluma Purmell in her autobiography (Hufford, Hunt, and Zeitlin 1987:56–59). This ability to adopt the perspective of other age groups is a powerful resource for overcoming a devastating sense of "otherness" (Mullen 1992:18). Cultivating empathy in the young, the elder becomes someone who was, and still is, a child or a young man or a new mother, who knows what life's central experiences are like, despite sweeping technological changes.

In recent decades, some folklorists have examined the ways in which elders shape reminiscence into "life review projects." In some cases, elders compose autobiographies, explicitly for grandchildren, organizing their memories on paper or on tape (Hufford 1992:174–188). Other projects take the form of scrapbooks, or organizing the photo album or a chest of keepsakes. Objects featured in folk-art exhibits developed during the

1980s show the hallmarks of self-definitional rites, which Barbara Myerhoff observed in the elderly (Myerhoff 1978). Fashioning autobiography, some elders craft new social roles and networks as well.

Autobiography, which situates the self in narrative, is one way of conferring wholeness on a fragmented array of experience. Some elders begin to reconstitute their past in response to cataclysmic loss—the death of a loved one who was a significant witness in a person’s life, premature unemployment, the onset of significant disability, the removal of familiar settings, or recognition of the sheer passage of time. Thus, feeling “like a ship without a rudder” at her husband’s death, Ethel Mohammed began a series of embroidered scenes spanning the years of her life (Hufford, Hunt, and Zeitlin 1987:44–45). Other memory projects have been precipitated by life-cycle events or by inexplicable memory surges reported among the very elderly. To celebrate her retirement from a family business in the year of her fiftieth wedding anniversary, Viola Hanscam of Oregon transformed scraps of clothing worn over the years by family members into seven stair rugs, each depicting a threshold event such as a wedding, a birth, a move to a new home (Jones, 1980:85). Bluma Purmell of Philadelphia found her mind flooded with insistent memories from her childhood, and she then saturated canvases with bright paintings of turn-of-the-century farm life in southern New Jersey (Hufford, Hunt, and Zeitlin 1987:56–59).

Memory projects may materialize a world in which an elder took shape but which now exists only in memory. Reconstituting a lost world enables an elderly artist to recover the experiences of that world, to articulate the imprint of the elder’s generation on the world at a particular time in history. Crafting a miniature farmyard, carving a set of old-fashioned lumbering tools, modeling scenes from childhood neighborhoods or homelands, displaying collections of tools on barn walls or in home museums, or demonstrating the use of old machinery at festivals, elderly artists materialize aspects of life that exist only in memory and thus show younger witnesses how the world has changed (Beck 1982; Hufford, Hunt, and Zeitlin 1987).

Such projects can provide elders with new social currency, functioning as thresholds for narratives and other forms of enactment that conjure lost worlds in the presence of witnesses. Myerhoff has observed that performing before witnesses is essential to complete the work of self-definition: “Always, self and society are known to the subjects themselves—through enactments” (Myerhoff, 1978:32). Witnesses provide the reflecting surface integral to any definitional rite, affirming that the self portrayed and the self apprehended are one and the same. Interestingly, in a number of remembered worlds, the elder is represented as a young witness to a now vanished way of life. This representation comprises a subtle direction to fresh witnesses of worlds written, collected, carved, narrated, or painted. The elder’s self-definitional work becomes a resource for future elders, furnishing models and materials for the perennial task of defining self and community.

As a widespread and patterned means of traditionalizing experience, memory projects invite serious folkloristic study. Recent studies of memory projects challenge traditional perspectives on folk art, which have excluded memory projects as too personal, too nontraditional, or too eclectic for consideration. In another quarter, folk-art collectors and historians have obscured the material culture of the elderly through interpretations that excise autobiographical and historical meanings (Kirshenblatt-Gimblett 1988:148).

This pattern of constructing intergenerational ties challenges dominant assumptions about cultural transmission. Traditional skills, which according to conventional wisdom are “passed on from generation to generation,” are not, in fact, so automatically transferred. The link-chain effect of grandparents teaching grandchildren is echoed in the elder’s exploration of life’s earlier stages for skills and memories to take up in later years. The common pattern of a cultural hiatus in mid-life fosters an impression that traditions are “dying” along with their elderly practitioners. Repeatedly we see retirees revive skills to which they were exposed in childhood, such as fiddling, basketry, gardening, and needlework (Jabbour 1981; Hawes 1984), but the recycled skill need not take the form of a canonical tradition to fit this pattern. Nontraditional materials and idioms may be used in the traditionalizing labor of shaping life’s experiences into meaningful form. The active role of younger witnesses in stimulating such practices among elders seems to support Margaret Mead’s assertion that cultural survival depends on the simultaneous participation of three generations (Mead 1972:311).

Such insights about witnessing shed new light on the folklorist’s traditional reliance on the elderly. For folklorists and anthropologists seeking information about vanishing traditions, elderly individuals were ideal informants for documenting “culture at a distance.” Sifting through the memories of elders for vanished customs, sayings, narratives, songs, and so forth, early folklorists were able to assemble collections that effectively displaced autobiographical contexts of origin. Only recently have folklorists and anthropologists come to appreciate their role as witnesses to the life stories jointly constructed in the ethnographic interview, itself a worthy topic for further investigation.

Almanac

Annual compendium of calendar, weather, astronomical, astrological, and navigational charts eventually expanded to include miscellaneous entertainments and information on a broad range of topics. Almanacs as we recognize them evolved in the late Middle Ages in order to provide useful charts and information about the movements of celestial bodies and the tides. By the 16th and 17th centuries, astrology and belief in the ability to prognosticate weather based on the movements of the heavenly bodies received wide acceptance among the educated, and charts reflecting both became staples in most almanacs.

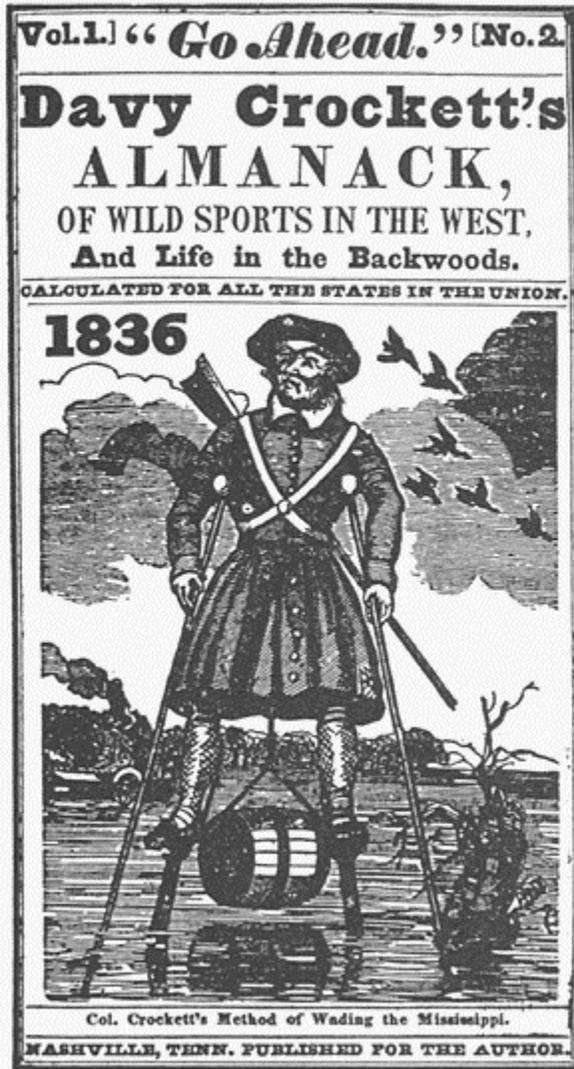

The first book printed in colonial America was an almanac, written by Captain William Pierce and published by Stephen Daye in 1639, at Cambridge, Massachusetts. By the end of the century, the number and variety of almanacs published by colonial presses increased dramatically up and down the Atlantic seaboard.

Driven by fierce competition, 18th-century printers broadened what they included in their almanacs and made outrageous claims about the superiority of their almanacs over all others. The Man of Signs showing the impact of the celestial bodies on the vital organs of human beings became standard in 18th-century almanacs. James Franklin and Nathaniel Ames, two Boston printers, added snippets of news events and short moralizing essays. James' brother Benjamin Franklin, using the pseudonym Richard Saunders, edited from 1732 to 1758 *Poor Richard's Almanac*, perhaps one of the best-known American almanacs. It was packed with proverbs—some of his own coining, but most drawn from other sources—practical recommendations for farmers and domestics, and detailed descriptions of American customs and traditions.

Gradually, printers incorporated popular jests and current comic anecdotes into their almanacs. Immigrants, women, lawyers, and politicians were common targets. Medical formulas for curing beasts and humans became usual features, while other publishers added thrilling tales of frontier explorations, Indian captivities, and eyewitness accounts of marvelous events and strange occurrences. Homespun poetry, humorous and tragic anecdotes, popular legends and ballads, political speeches, notable quotations, patriotic essays, and cracker-barrel philosophy found their way into almanacs, alongside the weather predictions, schedules of the tides, and astrological charts.

Almanac publishers also targeted particular audiences. The almanacs directed at farmers were very successful, and one of them, the *Farmer's Almanac*, founded in 1792, endures today. Although much has been added to it, it retains many of the features of the earliest almanacs, including astrological charts, weather predictions, proverbs, and jests. Other shorter-lived, special-interest almanacs, including the *Lady's Almanac*, the *Temperance Almanac*, the *New England Anti-Masonic Almanac*, and those devoted to various religious and political causes, such as the *Christian Almanac* and the *Whig Almanac*, appeared and disappeared almost yearly. Virtually every state had its own almanac.

One of the more notable specialized almanacs featured Davy Crockett. Appearing first in 1835, two years after the publication of Crockett's *Life*, and continuing until 1856,

Title page of Davy Crockett's Almanack for 1836. In the mid-1800s, humorous almanacs surged in popularity. Library of Congress.

its various authors packed the series with tall tales and graphic illustrations about the incredible adventures of the real and a fictitious Crockett. This almanac played a

significant role in transforming this backwoodsman, politician, and soldier of fortune into a culture hero.

By the 19th century, almanacs had become important conduits of popular culture and cheap literature. But late in the century, publishers began calling books of facts almanacs. Addressed to urbanites, these publications dropped the astrological and navigational information and ceased publishing material drawn from folklore and popular culture. In their place, publishers provided statistical information about business and industry, news summaries of major national and international news events, and factual data about government, entertainment, and sports.

At the end of the 20th century, only a few of the earlier kind of almanacs exist, maintaining a publishing tradition that saw its heyday in the 18th and 19th centuries when almanacs captured in print current popular culture and folk traditions.

American Folklife Center

A national research, archival, and programming center established in 1976 within the Library of Congress (LC) in Washington, DC, by Public Law 94–201, the American Folklife Preservation Act. The center’s congressional mandate to “preserve and present American folklife” has led to a variety of field projects, publications, public programs, and exhibitions, and its Archive of Folk Culture is the largest and most comprehensive North American ethnographic collection of folk music, folklore, and folklife.

The center was created after several years of congressional debate regarding its value, location, and functions, and a lobbying effort supported by the American Folklore Society and organized by folklorist Archie Green. The effort also resulted in the creation of the folk and traditional arts program of the National Endowment for the Arts, and it coaxed the National Endowment for the Humanities into greater recognition of the field. The center is overseen by a board of trustees, and its budget is from federal appropriations supplemented by private funds.

The center undertakes projects that document folk cultural traditions in the field. Such projects continue the tradition of the center’s Archive of Folk Culture, which since 1928

has used fieldwork to generate collections. In the archive's early history, documentation focused on musical traditions and used sound recordings as the primary medium. The center's fieldwork includes verbal traditions, dance, ceremony, material culture, traditional knowledge and skills, and "way of life." Documentary media include not only sound recordings but still photography and other visual media.

Center publications range from research tools to policy studies, from bibliographies and discographies to compact discs and a videodisc, from informational booklets to exhibition catalogs. Two series, *Publications of the American Folklife Center* and *Studies in American Folklife*, are ongoing, and a third, *Folklife Annual*, produced five editions

between 1985 and 1990. Other center publications have appeared in cooperation with private-sector presses and media companies. *Folklife Center News* (1977–) publishes articles on center activities and essays on the field.

Center exhibitions have ranged from modest displays to major traveling exhibitions with book-length catalogs, such as *The American Cowboy* (1983) or *Old Ties, New Attachments: Italian American Folklife in the West* (1992). Public events include a summer concert series, winter workshops and demonstrations, periodic lectures, symposia, and scholarly conferences. The center's tradition of technological experimentation began with its archive. Just as Robert Winslow Gordon experimented with a portable disc-cutting machine in the early 1930s, the center produced a videodisc (*The Ninety-Six Ranch*) in the 1980s and has pioneered in using the Internet to share information and collections digitally in the 1990s.

Reference services are available in both the archival collections and the general subject areas of folklore and folklife. In addition to direct access to the collections, visitors to the Folklife Reading Room find a selection of the LC's publications pertaining to folklore and folklife, listening and viewing facilities, and extensive vertical files covering persons, organizations, and subject areas. Reference services are available by telephone, correspondence, or electronic mail. *Folklife Sourcebook* lists information regarding the national field. The center is accessible through LC MARVEL, the Library of Congress' Internet address: lcmarvel@seq1.loc.gov. Arecorded telephone service, Folklife, provides information on events, jobs, and other subjects (202–707–2000). American Folklore Scholarship: The Early Years

Collection and study of American folklore from the beginning to the 20th century. In a sense, American folklore scholarship began almost simultaneously with the European discovery of the New World. Friar Ramon Pane accompanied Christopher Columbus on his second voyage in 1493 for the express purpose of collecting all the “ceremonies and antiquities” of the Taino Indians, a tribe that has long been extinct. Three years later, in 1496, Pane’s little book, *On the Antiquities of the Indians*, appeared. This moralistic view of Indian folklore written from a Christian standpoint included narratives, beliefs, and accounts of rituals. In its emphasis upon the Indian and his quaintness, Pane’s volume is typical of most of the works dealing with American folklore that followed it over the next four centuries.

While there were other collectors of American folklore after Pane, it was the 19th century before anyone envisioned a field of study in which folklore would be the central concern. Henry Rowe Schoolcraft (1793–1864) was the first American to set forth a systematic concept for a discipline of folklore. His first suggestions in this regard were presented in *Algie Researches* (1839), a collection of American Indian narratives Schoolcraft gathered during several years as an Indian agent on the northwestern frontier. His ideas were more fully presented in later publications. Basically, Schoolcraft envisioned a total science of man, albeit one that focused on the “rude nations,” in which folklore played an important part. Schoolcraft’s new discipline had four main objects of inquiry: (1) physical type of man; (2) material existence, by which he meant what is now called material culture; (3) intellectual existence, including music and poetry, oral tales and legends, medical knowledge, and mythology; and (4) geographical phenomena affecting or modifying the above features. These elements were to be determined through examination of numerous types of data, including art remains, dictionaries, grammars, place names, skulls, mummies, histories by European travelers, missionary translations, works ascribed to natives, “authentic traditions of all ages and countries,” natural history, and mythology. Although much more than folklore was included in this new field of study, Schoolcraft nevertheless considered oral and material tradition basic and essential to the whole. Mythology was particularly significant because it contained the framework of the philosophy and religion of the “rude nations” and gave character to their songs and poetry.

Schoolcraft’s “new” science involved both field observation and library work, emphasized the American Indian, and was survivalistic. Oral traditions were regarded as fossils of an earlier day that were still preserved and functioning though rapidly disappearing. Like the bones of extinct or ancient species of animals, they were far removed from civilization. This concept of folklore made the collection of such materials urgent, because those gathering them were retrieving from “the oblivion of past generations matter for thought and reflection for the future.”

Although Schoolcraft is correctly designated the “father of American folklore,” he made little contribution to his chosen field beyond the information he collected. Like most of his contemporaries, he considered himself primarily a collector, but a few scholars active at the same time were primarily theorists. The two most important of these were Horatio Emmons Hale (1817–1896) and Daniel Garrison Brinton (1837–1899), America’s premier solar mythologists. Both were indebted to the German-born scholar Max Müller (1823–1900), who maintained that all myths could be linked to the sun and the solar cycle. While Hale basically accepted the “disease of language” thesis that Müller used to dismiss any factual basis for myth and legend, he was convinced that such traditions often originated historically. In numerous books, such as *Myths of the New World* (1868) and *American Hero-Myths* (1882), Brinton reached essentially the same conclusion as Müller, differing from the European master in not relating all myths to the sun; in several instances, he found connections with the moon or with lightning. Brinton saw a need to study the influence of myths on both the individual and the national mind, but he realized that the state of collections often made this kind of analysis difficult, if not impossible. Both Brinton and Hale championed a theoretical viewpoint that was never very popular in America and is now the most soundly rejected of all past folklore theories, and neither of these men had any students. What is more, solar mythology was a theoretical school characterized by disunity rather than unity. Most proponents acted as if they were unaware of the contributions of others holding the same views. So, although Hale and Brinton became significant individuals in folklore study, neither exerted much influence on future generations of folklorists.

Based purely on folklore collecting, few Americans of the 19th century were more important than John Wesley Powell (1834–1902). As head of the Bureau of Ethnology (after 1894, the Bureau of American Ethnology) from its founding in 1879 until his death, Powell was responsible for publishing most of the major collections of American Indian folklore that appeared in print during that twenty-three year span. Congress established the bureau primarily to carry on research already begun, but from the outset Powell intended more. He thought of the agency as the focal point around which all American Indian studies would be centered. Toward this goal, he implemented a research program that included detailed bibliographic compilations, new field studies, the development and circulation of questionnaires, and publication of *Annual Reports* and *Bulletins*.

Powell belonged to the evolutionary school that saw all society developing through four levels of progress. Three of these stages—savagery, barbarism, and civilization—were already realized, but in the future an additional level, that of “enlightenment,” would be achieved. He expounded his views in a large number of prolix and dense publications, but these writings are of interest to 20th-century readers only as historical curiosities. Powell’s real importance is as the overseer of several folklore works issued in twenty-three *Annual Reports* prepared under his direction. The authors of these works include many of the best-known 19th-century students of American Indian folklore: Erminnie A. Smith, Washington Matthews, James Owen Dorsey, James Mooney, John G. Bourke, Alice Fletcher, and Frank H. Cushing, among others. Most of these studies were consistent with Powell’s view of folklore as survivals from a lower stage of culture.

Throughout the 19th century great attention was accorded Indian folklore; prior to 1900 relatively little work was done with the lore of other groups. Even such a significant cultural group as African Americans was virtually ignored until the second half of the

19th century. Two major assumptions prevalent in American society contributed to this neglect: first, that the Black man was incapable of any thought or expression worthy of serious study, and, second, that Whites knew everything worth knowing about the slaves who lived inside White society. In the mid-19th century, this paternalistic view was considerably altered, and, in large part because of the controversy over slavery, an intellectual curiosity of the part of Whites toward the Negro emerged.

Occasional references to African American folklore started appearing beginning in the 1830s. One of these, a letter by Lucy McKim (1842–1877) in *Dwight's Journal of Music* in 1862, is often cited for first bringing slave songs to public attention, although that claim can be disputed. Not until the post-Civil War years was the first extensive collection of Negro folklore published, and it came about largely through the efforts of a classical scholar who was a pioneer in both Black dialect and song studies. William Francis Allen (1830–1889) was a native of Massachusetts who spent two years in the South with the Freedmen's and Sanitary Commissions after the Civil War. During his stay in South Carolina and Arkansas, Allen collected Negro songs, and he eventually met Charles Pickard Ware (1840–1921) and McKim, both of whom had also collected songs. The three soon met other collectors and combined their material to produce *Slave Songs of the United States* (1867).

For a pioneering work, this volume set a high standard and was unusual in that it contained musical settings for each of its 136 texts. The authors also considered regional characteristics of Negro folk music, a topic overlooked by most of their successors. They paid attention to the situations in which songs were performed, another subject that few collectors of their time considered. Admirable as it is, *Slave Songs of the United States* does have flaws, perhaps the most glaring being the ethnocentric judgments that Allen, Ware, and McKim occasionally make. For example, Negro music is judged as being either civilized or barbaric rather than seen as a musical system with its own set of values. Despite its limitations, the book brought Black folklore, or the musical part of it, to widespread public view and whetted the interest in collecting, analyzing, and performing Negro folk music that has never since abated.

Nearly two decades after the appearance of *Slave Songs of the United States*, the first extensive account of African American secular music was published. In 1886 George Washington Cable (1844–1925), primarily remembered as a local-color novelist, produced two articles for *Century* magazine dealing with Creole Negro folksong and dance. In these essays, Cable touched on two topics that were controversial for many years thereafter. One was the dispute over the banjo and its use by Black musicians, Cable flatly stating that “it is not the favorite musical instrument of the negroes of the Southern States of America.” The second dispute was over the idea that Negro songs had originated in Africa, a view that received little challenge from Cable's American contemporaries but was firmly opposed by some foreign writers, like the Englishman Richard Wallashek. The most damaging attack on the theory of African origins came many years later with the publication of Newman Ivey White's *American Negro Folksongs* (1928).

In the same decade that Cable's articles appeared, a second kind of Negro folklore came to public attention, one that all commentators at the time agreed was of purely African origin. This body of Black lore was the animal tale, as handed down from generation to generation by word of mouth. These tales gained widespread prominence in

1880 through the efforts of Georgia journalist Joel Chandler Harris (1848–1908). Harris had heard African American folktales most of his life, but the immediate impetus for his writing on the subject was a December 1877 article, “Folklore of the Southern Negroes,” in *Lippincott’s* magazine. Taking exception to author William Owens’ efforts, Harris produced his own book, *Uncle Remus: His Songs and His Sayings* (1880), which was received as a literary and folklore masterpiece. Harris claimed he was an accidental author and an unintentional folklorist, but there is little doubt that his various publications had a profound affect on the subsequent collecting of African American folktales.

Harris was sometimes uncomfortable being regarded as an authority on folklore, but he was not reticent about offering theories. At least two that he included in his Uncle Remus volumes were accepted unquestioningly by most later students of African American lore: that the folktales of Blacks were of remote African origin and did not betray European influences, and that Negro folktales had not been influenced by those of the American Indian, as John Wesley Powell and others had suggested. On the latter point, Harris was supported by no less an authority than folktale scholar Thomas Frederick Crane (1844–1927), who, in an 1881 review article, concluded that the idea of Blacks borrowing narratives from the tribesmen was “an hypothesis no one would think of maintaining.” Eighty-four years later, in 1965, Alan Dundes offered further support for this view, although he was more temperate in his claims than Crane. Among other points, Dundes noted that “many folklorists have assumed, wrongly in my opinion, that all African origins must be in West Africa.” He then pointed out that many slaves came from East Africa, where the hare, an important figure in African American folktales, is the principal trickster figure. Dundes asserted that the burden of proof was mainly on those making the claim that Blacks borrowed their trickster tales from the American Indian.

Richard M. Dorson (1916–1981), one of the most prolific American folklorists, offered the first significant challenge to the thesis of African origins of black folktales. Working with a corpus of over one thousand folktales he collected in the 1950s from Negroes born in the South, Dorson concluded that “this body of tales does not come from Africa” or “from any one place but from a number of dispersal points.” What’s more, he argued that the animal tales, such as those recorded by Harris, “are of demonstrably European origin.” Although basing his conclusions on the best available modern reference works, such as motif indexes, Dorson’s argument fell largely on deaf ears.

Two basic approaches to folklore coexisting in the late 19th century were the anthropological and the literary. Largely because of the influence of William Wells Newell (1839–1907) and Franz Boas (1858–1942), the American Folklore Society (AFS), established in 1888, was oriented toward the anthropological approach. These two men were the major forces in the early years of the AFS, Boas maintaining that role for half a century. They were united in their view of folklore as a division of the broader science of anthropology, and both wanted to make anthropology and folklore more professional. Newell thought that amateurs would undoubtedly continue to be active in folklore, but he believed they should adhere to rigorous scholarly standards. He sided with Boas on the anthropological emphasis of the American Folklore Society, thinking that in so doing he would both distinguish himself from the nonprofessionals interested in folklore and simultaneously increase the scholarly output of *the Journal of American Folklore (JAF)* by filling it primarily with anthropological data. This alliance also added the weight of

the European academic tradition, represented by Boas, to Newell's attempts to professionalize folklore.

Boas also benefited greatly from his relationship with Newell and the AFS. He had a genuine interest in folklore as a significant aspect of anthropology, and he needed the society as a power base through which he could propound his ideas. Moreover, the *JAF* was an excellent publishing outlet for his students because, unlike the anthropological journals, it allowed him control over the form and timing of the publication of articles. Actually, the American Folklore Society was virtually Boas' last hope for gaining professional clout, because it was the only organization that indicated some interest in him and his approach to anthropology. He had earlier attempted unsuccessfully to obtain positions of influence in the American Association for the Advancement of Science and the Bureau of American Ethnology. Newell, however, was grateful to have him as an ally, and he gave him virtually a free hand in AFS matters.

Perhaps the main reason Newell found Boas appealing is that Boas offered a more comprehensive and systematic approach to folklore than had existed before, one that he ultimately illustrated in his studies, theoretical papers, and field collecting projects. A major element in Boas' approach to folklore was good fieldwork, gathering material firsthand with extensive interviews. This emphasis was a bold step away from his earlier influences; 19th-century European scholars, representatives of the tradition in which Boas was trained, generally held a negative attitude toward fieldwork, regarding it as mere collecting and, thus, far removed from true scholarship, defined as the comparison, analysis, and interpretation of materials.

To Boas, good fieldwork consisted of accurately recording data and finding the best informants. Ideally, the collector should seek out someone who knew and could relate data on every aspect of village life. He usually relied on a single informant from a community, an approach unusual in his day, but one adopted later by his students. Boas also helped popularize the practice of amassing data with no particular problem in mind and with no clear idea of what was to be gained in the end. This approach resulted from his belief that each culture possesses its own concepts, categories, and biases, and that to arrive at a true understanding of another culture it was essential for scholars to collect vast quantities of reliable material in the native language. Myths and tales thus gathered would be preserved for all time as undistorted expressions of the culture, containing all of the keys necessary to understand that society. By poring over accurately recorded texts, one would arrive at new theories and new problems to be solved. In other words, the data would direct the interpretation.

Much of Boas' field methodology is considered faulty by modern standards, but he did record an enormous amount of useful data and, more than most scholars of his day, tried to view Western civilization as only one, not *the*, standard of reference. Furthermore, he realized the limitations of personal observation, and he was convinced that people see what they expect to see and interpret what they see in the light of their previous experiences. Boas insisted on accuracy in recording data and on limiting research to problems that could be solved by observable facts. He also made fieldwork, at least among "exotic" groups, popular and acceptable in a way it had never been before. Finally, his emphasis on the value of presenting accurately transcribed texts was important at a time when folktales were often published as literary products, without care for their original form.

Boas was not opposed to making theoretical pronouncements, but he was cautious about offering them. Indeed, he maintained that collecting numerous folktales from contiguous peoples and plotting the distribution of their “elements”—by which he meant something roughly akin to motifs—must precede any theoretical work. He failed to explain, however, how much collecting and mapping were needed before one could justifiably begin theorizing. It is also unclear exactly what Boas meant by theory in folklore, for he never demonstrated by example his ideas in this regard. He often referred to statements of a psychological kind, but his only detailed discussions are of historical processes.

Boas’ thinking about folklore is most completely set forth in the mammoth volume *Tsimshian Mythology* (1916). In this book, especially its prefatory essay, he emphasizes proper recording and presentation of texts, offering the then novel suggestion that folklorists should not limit their work to “star” informants or to the “correct” version of an item when variants occurred and such versions affected transmission of the tale. Unfortunately, neither Boas nor his disciples followed this idea, which is still not common practice in folklore fieldwork. The book is also important because it sets forth Boas’ concept of folktales as a “reflector of culture,” a point only hinted at previously but restated in several later writings. This thesis led Boas to think of tales as a type of cultural autobiography; he overlooked the possibility that an oral literature might not mirror all aspects of life equally.

From a scholarly standpoint, there were both positive and negative results of Boas’ decades-long influence in the American Folklore Society. His insistence on good objective fieldwork and accurate presentation of data, caution about theorizing based on faulty or insufficient material, professionalization of the field of folklore, and production of folklore fieldworkers and support for their research and publications are on the positive side. Moreover, his students constitute a veritable Who’s Who of anthropological folklorists, including, among others, A.L.Kroeber, Elsie Clews Parsons, Robert H.Lowie, Paul Radin, Martha Warren Beckwith, Ruth Benedict, Melville Jean Herskovits, Gladys Reichard, Ruth Bunqel, and Melville Jacobs.

One negative aspect of Boas’ influence was an overemphasis on American Indian folklore. While he recognized that other peoples had oral traditions, he showed little interest in nonaboriginal subjects. For example, he refused to allow Vance Randolph to do a dissertation topic dealing with Ozark mountaineers, preferring instead to direct him toward a West Coast Indian tribe. Rather than follow Boas’ suggestion, Randolph left graduate school. Boas’ bias permeated American Folklore Society publications during the more than three decades that Boasian folklorists were editors of the *Journal of American Folklore*. Throughout this period, virtually every issue of the quarterly contained at least one article or collection of tribal myths or tales, all following the Boasian model whereby texts are presented with little or no attention given to the informants, context, or style. There was, of course, nothing wrong with the collection of American Indian traditions, merely with the journal’s imbalance. The net effect was to reinforce a view held by many that folklore existed only in places and among peoples outside the mainstream of civilization.

Boasian scholarship can be faulted on several other counts. Boas had no intellectual interest in informants except as repositories of oral traditions, a lack of concern derived from his orientation toward the past. He focused entirely on bygone traditions, or what

has come to be called “memory culture.” Having thus given up any concern for the present, he saw no need to learn much about the living bearers of a tradition. Moreover, his belief in a superorganic concept of culture made any interest in those who preserve and pass on folklore irrelevant; the recording of texts was all that one needed. Boas was certainly not the only person holding such views, but he was one of the most influential adherents. This attitude held sway among folklorists long after Boas’ death in 1942 and only began to change in the mid-1960s.

Some other aspects of Boas’ thinking about folk traditions did not bode well for the future development of an independent discipline devoted to the study of folklore. He believed that it was important to collect and study oral traditions because primitive man is our ancestor, and folklore, as a reflector of culture, offers important insights into primitive thought. Through a rigorous study of tribal lore and culture, one could eventually arrive at what he called “original nature.” Thus, folklore, or the “primitive arts” as Boas sometimes called it, had importance only as a means to an end. Many of his contemporaries and scholarly descendants had essentially the same outlook.

Ultimately, Boas’ significance in the history of American folklore is that he effectively presented a systematic way of dealing with his materials. He offered a method for recording oral traditions that promised to lead eventually to the formation of folklore theories based on sound scholarship. That his ideas were adopted by numerous other scholars was in no sense a small achievement.

During the late 19th century, the literary approach to folklore was championed primarily by the Chicago Folk-Lore Society and its moving force, Fletcher S. Bassett (1847–1893), a retired lieutenant in the U.S. Navy. An independently wealthy man, Bassett had been forced into retirement in 1882 by ill health, whereupon he moved to Chicago and devoted the remaining years of his life to private scholarship. In 1891 he persuaded more than sixty people to attend the inaugural meeting of the new society, and for the next couple of years it was a viable organization devoted to pursuing the idea of folklore as an art form totally independent of its cultural milieu.

Bassett’s goal was to display folklore in an engaging manner. The folklorist should approach his data as a man of letters rather than one who enshrouded his materials in a coldly clinical scientific style. Because those in charge of the *Journal of American Folklore* were opposed to this idea, it was necessary to create a new folklore publishing outlet, so in July 1892 the *Folk-Lorist*, the official publication of the Chicago Folk-Lore Society, appeared. Bassett also produced the *Folk-Lore Manual* (1892) so that interested parties would know how to go about collecting lore. This publication elucidates Bassett’s concept of folklore more than any other source. Like many of his contemporaries, he believed that “the fast-decaying traditions of our native tribes and of the negroes and mixed races are the most important, and work among them, will, perhaps, bring the most abundant results.” He shared the view of folklore as data that were rapidly disappearing, but, unlike other scholars of the day, he maintained that oral traditions existed among all classes of human beings, not just among primitive and uncivilized people. He even suggested that railroading, telegraphy, and photography were three professions in which folklore could be found in abundance.

The Chicago Folk-Lore Society’s crowning achievement was the International Folk-Lore Congress held at the 1893 Columbian Exposition in Chicago. This gathering of scholars from around the world was intended to be of interest to the general public as

well as to academics. Although the meeting got off to a good start with a huge audience attending the first session, attendance by both the audience and the academic participants dwindled after the first day. Even the Chicago newspapers commented on the failure of speakers to show up. A greater problem for the society was Bassett's death shortly after the congress ended. In fact, his loss was fatal to the organization, because no one filled his role. Probably the main reason for this situation is that, except for Bassett, the other resident members were folklore dilettantes. In 1898 the *International Folk-Lore Congress of the World's Columbian Exposition*, containing papers from the 1893 congress, appeared, but by that time the society was, for all practical purposes, defunct.

With the demise of the Chicago Folk-Lore Society, the idea that folklore was a thing worthy of study in itself also ceased to be an actively espoused concept for nearly a half century. Ironically, though, the literary view of folklore won in a sense because most 20th-century folklorists were either trained or influenced by Stith Thompson (1885–1976) of Indiana University, and Archer Taylor (1890–1973) of University of California, Berkeley, who, while not following the literary approach advocated by the Chicago Folk-Lore Society, were literary folklorists nonetheless.

By the 1880s, folklore investigations of the American Indian were in full swing, even though by then the Native American had been examined by investigators of traditional culture for almost four centuries. After so long a time, seemingly every aspect of tribal culture would have received adequate consideration, but there was still one feature of Indian society that lacked intensive examination—music. This situation was soon rectified by a number of people, the first being Theodor Baker, a native of New York City who obtained a Ph.D. from the University of Leipzig with a dissertation based on songs he collected from Senecas in New York State and from members of various tribes at the Training School for Indian Youth at Carlisle, Pennsylvania. This volume was published in 1882 as *Über die Musik der nordamerikanischen Wilden* (On the Music of the North American Savages). Seventy-one melodies were printed, thirty-two of which were analyzed in some detail, but, despite the serious tone of Baker's book and its landmark importance in the history of ethnomusicology, it has remained obscure and little used. Baker's later lack of interest in Indian music and the fact that his volume was published in German both played a part in its general lack of recognition.

Far better known is the work of Alice Cunningham Fletcher (1838–1923), an erudite and urbane Bostonian, who almost reached middle age before starting work in ethnomusicology. Fletcher struggled to overcome her reaction to Indian music as “screeching cacophony” and her own preconceived ideas concerning “savage” music; she later admitted that she had been enslaved by her previous racially biased training. By 1891 she received a fellowship that enabled her to devote the rest of her life to her Indian studies, the best known of her publications being *A Study of Omaha Music* (1893). This work was also the major result of her collaboration with John Comfort Fillmore (1843–1898), who used the study to set forth his theory of primitive music. His was an elaborate, evolutionary scheme that proposed a single line of development for all cultures, based on the study of a specific culture. All music was constructed along “harmonic” lines, folk music differing from art music only in the manner of development. Therefore, all attempts to reduce primitive melodies to scales had to consider the natural harmonies involved. So convinced was Fillmore of this “natural harmonic basis” that he

provided harmonizations with the melodies he printed, not merely to make the music more “pleasing” to Western ears, but also to indicate the “true nature” of the tunes.

Fillmore never wavered from his theory, and it found acceptance among scholars primarily because it elevated Indian music to an artistic form worthy of respect. At the time, there was a prevailing attitude that the aborigines had no musical sense or genius, particularly when compared to the Negro. The Fillmore-Fletcher work, however, belied this, pointing out that all musics were essentially the same, just in different stages of development. After Fillmore’s death, Fletcher did not publicize his theory, perhaps because her own interests were more general. She produced one other major work, *The Hako: A Pawnee Ceremony* (1904).

Jesse Walter Fewkes (1850–1930) is important as the first American to utilize the phonograph in fieldwork, when in 1890 she used the then new invention to collect songs and tales of the Passamaquoddy tribe in Maine. A short time later, Frances Densmore (1867–1957), destined to become one of the most famous ethnomusicologists of her time, began her work with a collection of Chippewa music. At first she produced mainly popular works, but later she became a thoroughgoing scholar. Like many other ethnomusicologists, she also began to work in isolation from other published materials, as if no one else had ever written on the topics she treated.

Few collectors of Indian music had plans as ambitious as Natalie Curtis Burlin (1875–1921), who wanted to produce a book representative of all North American Indian music. Realizing this was an impossible task, she opted for one hundred forty-nine songs from eighteen tribes in *The Indians’ Book* (1907). She hoped the volume would demonstrate the “latent capabilities” of a people “utterly unlike any other in the world.” Further, she thought that Indian music would provide the art musician with “a new and vigorous art impulse” because the tribe members unconsciously tried “to make beautiful the things of daily living.” This possibility made it imperative that her publication be of a popular nature.

A number of classical composers essentially agreed with Burlin that Indian music could be utilized as the basis of artistic compositions. Among the leaders of this movement were Arthur Farwell (1872–1952), establisher of Wa-Wan Press, a venture committed to works developing in “interesting fashion” any indigenous folk music, Charles Wakefield Cadman (1881–1946), and Arthur Nevin (1871–1943). These, and other composers, arranged collections of Indian melodies, inspiring a movement that continued well into the 20th century and eventually included consideration of much more than just Indian music.

Another aspect of music received consideration when Francis James Child’s ten-volume collection, *The English and Scottish Popular Ballads*, appeared in 1882 to 1898. Child (1825–1896) saw this as a work of cultural archaeology because he was convinced that ballad singing was a dead art. He was rescuing the cream of the crop from oblivion; hence the *The* in his title. Ironically, this summing up of the English and Scottish ballad tradition was done before any of the substantive work in Anglo folksong and ballad collecting had been done. In effect, Child motivated that fieldwork; it was almost as if collectors were intent on proving him wrong about ballad singing being a lost art. Consequently, for approximately fifty years after his final volume appeared, most fieldworkers set about recording variants and versions of Child ballads, *and little else*. An exception to this trend was Cecil Sharp (1859–1924), an Englishman who traveled the

southern Appalachians from 1916 to 1918 collecting all manner of songs that were of English derivation. Another exception was Vance Randolph, the most famous of Ozark folklorists, who spent approximately three decades collecting ballads and folksongs from Ozark mountaineers. Even Randolph, who thought everything sung by a folksinger was important, gave the highest priority to Child ballads, reserving the first volume of his mammoth *Ozark Folksongs* (1946–1950) to these gems.

The study of American dialect began in the 19th century, although, unlike other areas of folklore scholarship, this movement was an outgrowth of neither the Romantic movement nor anthropology, but philology. Most of those who investigated American dialect were ignorant of, or even uninterested in, other genres of oral tradition, a situation not unusual in the history of American folklore studies, so often a history of disunity rather than unity. For his *A Vocabulary or Collection of Words and Phrases which have been supposed to be peculiar to the United States of America* (1816), John Pickering (1777–1846) deserves credit as the first American dialectologist. More important, however, was John Russell Bartlett (1805–1886), whose *Dictionary of Americanisms* (1848) was a scholarly best-seller, appearing in two subsequent editions in 1859 and 1877. Bartlett's theory of dialects depicted them as originating in two ways. First, local language developed from the propinquity of nationalities speaking different tongues borrowing words and phrases from one another. A more fruitful and permanent source was migration, and its effects could be seen in England, where "the immigrations of various nations into Great Britain from the Saxons down to the period of the Norman conquest are yet distinctly marked in the dialects of that country." Thus, one could know beforehand exactly when and where variations from standard language could occur, important because Bartlett thought it only a matter of a few generations until the United States would witness a proliferation of dialects as marked as those of Great Britain.

Bartlett's collection and that of his protege Maximilian Schele De Vere (1820–1898), who produced *Americanisms: The English of the New World* (1871), were gathered mainly from printed sources. This was not the case with Benjamin Homer Hall's *A Collection of College Words and Customs* (1851), a potpourri including everything from folk terms to an explanation of the Dudleian Lecture, an anniversary sermon preached at Harvard University, to a discussion of Harvard's merit system. Of course, Hall had to rely mainly on oral sources because many of the "odd words and queer customs" he sought were not written down. Even though he directed his attention to the unusual and the uncommon, Hall deserves credit not only for compiling one of the early works on dialect, but also for producing the first book dealing with college folklore.

In 1890, two years after the founding of the American Folklore Society, the American Dialect Society was established. Almost from the outset, one of the society's goals was to produce a dictionary that would provide "a complete record of American speech forms." Toward this goal, word lists from various areas of the United States appeared in virtually every issue of *Dialect Notes*, the organization's journal. Even so, more than one hundred years later the envisioned dialect dictionary has yet to appear, a testament to the difficulty of the task. What society members had in mind was something akin to Joseph Wright's six-volume *English Dialect Dictionary* (1898–1905), but the problems in this country are different from those encountered by Wright. Americans are more fluid, both geographically and socially, than Europeans, making the development of an extensive local speech more difficult. Distinctions between dialect and standard speech are also less

rigid in the New World; regional terms frequently appear in the usage of the educated; “illiterate” features repeatedly crop up in the works of local-color novelists. Compilers of general dictionaries have usually recognized these facts and included in their compilations a number of dialectal terms. America is also much larger, both geographically and demographically, and less homogeneous than England. Furthermore, when Wright started work, much of the labor had already been done in the form of published glossaries of English county dialects, and, in addition, local correspondents were available for consultation whenever needed.

Dialectologists made the same kinds of errors other folklorists committed, the basic one being an overcommitment to collecting and an undercommitment to gathering material in context. Motivated by a desire to recover every item of dialect before it was lost or by some other equally charitable goal, most collectors found little time or need to do more than provide a listing of materials. In one regard, however, dialectological work was ahead of most other folklore collecting done prior to the 20th century. Dialectologists never confined their subject matter to a savage or peasant state of society or, in fact, to any single group of people. They rightly saw it as belonging to all classes and periods of society. Had work in the many areas of folklore been more unified at the time, other scholars might have benefited from this attitude.

One final group of scholars active in the late 19th and early 20th centuries that deserve mention are what might be called “the overseas folklorists.” These were men like Charles Godfrey Leland (1824–1903), Jeremiah Curtin (1835–1906), and Lafcadio Hearn (1850–1904), who were peripatetic scholars who spent so much time in other parts of the globe that they never had time or opportunity to develop strong followings at home. Still, their contributions are significant in the history of American folklore studies, for their large number of publications, if nothing else.

Work in the various areas of folklore studies mentioned in this survey continued in the 20th century. These later works are covered in other entries of this encyclopedia, so are not repeated here.

American Folklore Society

A scholarly association that exists to further the discipline of folklore studies. The society was founded in Boston in 1888 by such luminaries as Francis James Child, William Wells Newell, Daniel Garrison Brinton, and Franz Boas, with its principal emphasis directed toward the publication of a “scientific” journal and the convening of an annual meeting.

Generations of scholarly theories and approaches are reflected in the society’s publications, revealing the sometimes partisan leanings of its members toward folklore as literature or folklore as a subfield of anthropology. The *Journal of American Folklore* (*JAF*) has been published quarterly since 1888. It includes articles, notes, and commentaries; reviews of publications, films and videotapes, audio recordings, and exhibitions and events; and obituaries. The *Centennial Index* (1988; vol. 101, no. 402 of *JAF*) provides a serial listing of all *Journal* entries from 1888 to 1988, with author, title, and subject indexes.

Additional publications of the society include a Memoir Series of book-length monographs (1894–1975), a Bibliographical and Special Series (1950–1978), and a New Series (1980–). Titles in the New Series, judged by a publications series editor and outside readers to be outstanding in the field, are issued with the imprimatur of the American Folklore Society through various university presses.

The *American Folklore Society Newsletter* has been published bimonthly since 1971. This publication carries official news and reports of the society’s business, as well as a wide range of information relevant to the field generally. Regular features include listings of academic meetings, publication news, job notices, grant announcements, a cooperation column, prizes, and information on electronic media. Special features include columns on computer applications in folklore study, career opportunities, the status of funding for folklore in federal agencies, and folklore studies outside the United States. The preliminary program of each year’s annual meeting is published in the August issue of the *Newsletter*.

In recent years, the society has moved beyond the early dichotomy between literary and anthropological folklorists. It provides a common forum for folklorists working in academic settings and those working in the “public sector,” a term broadly applied to folklorists working in nonacademic positions such as federal, state, and local government agencies (such as arts or humanities funding agencies) or private non-profit organizations (such as museums or historical organizations). The need to bridge the academic and public sectors has prompted the society to sponsor an annual public-sector internship for a graduate student to gain experience working in a public-sector agency and a public-folklorist-in-residence program, which places experienced public folklorists in an academic setting to pursue individual research and interact with faculty and students. The residency program was developed in cooperation with Indiana University’s Folklore Institute. Future partners for this residency program include Utah State University and Western Kentucky University.

The society's annual meeting takes place in October in cities throughout the continental United States and occasionally Canada. The five-day gathering offers panels, forums and workshops, film and video screenings, book exhibitions, special events, and tours of folkloristic interest. The society offers several prizes to honor outstanding work in African American folklore studies, public folklore, and Francophone folklore studies. Additionally, sections of the AFS, which are interest groups of society members, offer separate prizes. In 1995, there were approximately thirty such sections, addressing folklore genres (such as dance, folk arts, folk belief, folk narrative, foodways, and music), folklore of particular folk groups (such as African, American Indian, Baltic, British, Catholic, children, gay and lesbian, Italian, Jewish, Latino, occupational, and women), and professional issues (such as computer applications, graduate students, journals, social justice, and public programs). Sections meet at the annual meeting. Many of them sponsor sessions, offer prizes, and issue newsletters or journals of their own. Several sections maintain electronic bulletin boards, as does the society itself, available via a gopher at the University of Texas-Pan American.

The American Folklore Society is governed by an executive board composed of nine members plus the president and the president-elect, as set forth in the society's by-laws. An executive secretary-treasurer is responsible for the day-to-day administration of the society's business. The society's papers and records are archived at Utah State University's Library, Special Collections Division. These archives are indexed and are accessible for research.

Additional information about the society can be obtained by contacting the American Folklore Society, 4350 North Fairfax Drive, Suite 640, Arlington, VA 22203.

American Studies and Folklore

Scholarly connection interpreting traditions shaped by experiences and settings in the United States. American studies arose during the 1930s with folklore research as an important component. This interdisciplinary academic movement strove to interpret American society in a national perspective by combining American history, literature, and culture. The driving mission of identifying a national tradition led many American-studies scholars to folklore research, which had been used in Europe to examine the cultural basis of regions and nations.

A basic split occurred in early American-studies scholarship between those examining a distinctively national folklore, thus underscoring the case for an American exceptionalism, and those emphasizing the adaptation of international folk traditions on the American scene, thus suggesting a multicultural society. Since the 1980s, the argument has shifted to issues of multiple identities held by Americans, often expressed through folklore and the processes of cultural production.

Before Harvard University established the first formal degree-granting program for American studies in 1936, a substantial shelf of American-studies scholarship using folklore research had emerged. Constance Rourke (1885–1941) published *American Humor* in 1931 and cited American folklore—including traditionally learned tall tales and legends of tricksters and “ringtailed roarers”—as the distinguishing influence on American literary humor. Rourke believed that a distinctive American folklore formed out of the special circumstances of the new nation, such as its frontier. This folklore influenced the rise of an American literature based on vernacular characters such as James Fenimore Cooper’s Leather-stocking and traditional themes such as “rags to riches” and the “noble and ignoble savage.” In fact, she observed that the American tradition—in art, architecture, and literature—overall contained a unity of folk or vernacular spirit. For Martha Warren Beckwith (1871–1959), formerly a colleague of Rourke’s at Vassar College, American society was too diverse and derived too greatly from foreign sources to describe as a single tradition. Established as America’s first chair of folklore at Vassar, Beckwith outlined many living ethnic and religious “strains in the process of creating an American cultural life” in *Folklore in America* (1931).

Henry Nash Smith, the first graduate of Harvard’s History of American Civilization program, examined folklore sources of Edward Eggleston and Mark Twain, among other American fiction writers, in his dissertation, which led to the influential book *Virgin Land* (1950). In his work, Smith introduced an American-studies approach of “myth, symbol, and image,” drawn largely from folkloristic ideas of the consciousness-building powers of cultural mythology, and he used the development of the American West, an interest he credited to Texas folklorist J. Frank Dobie (1888–1964), to demonstrate his approach. American “myths,” scholars such as Smith and Russell Nye held, were not narrative texts in the usual sense; they were driving concepts or “collective representations” that unified Americans; examples were Smith’s “myth of the garden” (power of Americans to transform wilderness and desert into a new Eden-like garden)

and Nye's "myth of superabundance" (popular belief that resources are endless in America).

Smith suggested that historical patterns such as the westward movement were influenced by such myths and the lore and literature that arose from them. Philip D. Jordan pointed out, for example, that terms such as "manifest destiny" in the American experience were folk mottos of crucial themes that characterized the "essential narrative of this nation" (Jordan 1946). Such themes included westward movement, immigration, and industrialization. To this list, Nye added character traits of individualism, free enterprise, and progressivism that are evident in the nation's emergent folklore.

Smith encouraged the folklore research of Richard M. Dorson (1916–1981), a fellow graduate student at Harvard, who went on to become the strongest voice within folklore studies for building a relation to American studies. As director of Indiana University's Ph.D.-granting Folklore Institute, Dorson guided many students (he claimed he directed more than 200 dissertations) and devoted many books, especially *American Folklore* (1959), *American Folklore and the Historian* (1971), *America in Legend* (1973), *Man and Beast in American Comic Legend* (1982), and two special issues of the *Journal of the Folklore Institute* (1978, 1980) to the conceptualization of "American folklore" as opposed to "folklore in America." His work followed an agenda set out in "A Theory for American Folklore" presented in 1957 at the first joint meeting of the American Studies Association and the American Folklore Society (see Dorson 1978). He called attention to a unique set of historical forces—exploration and colonization, Revolution and the establishment of a democratic republic, westward movement, immigration, slavery and the Civil War, and industrialization and technology—that "shaped and created new folklore, or new adaptations of old folklore themes" peculiar to American society.

Dorson argued, for example, that the case of Davy Crockett required the perspective of both folklore and American studies. The frontier, he wrote, not only bred "new species of men and new institutions remote from European influences, but it cradled folk heroes and released a flood of legends" (Dorson 1971:32). Other "unique" heroes he described were Mike Fink the Keelboatman, Mose the Bowery B'hoy, Sam Patch the Mill Hand, Yankee Jonathan the Countryman, and Gib Morgan the Oil Field Liar. The folklore of these figures represented a new national consciousness. In *America in Legend*, he fashioned a history of the United States that followed the development of American folklore. The "religious impulse" represented by lore of providences, witchcraft, and judgments characterized the colonial period. The democratic impulse represented by ring-tailed roarers and folk heroes characterized the early national period. In the later national period, the economic impulse dominated and fostered lore of cowboys, lumberjacks, miners, oil drillers, and railroaders. In the contemporary period, Dorson concentrated on the folklore of youth culture and its "humane impulse."

Besides helping to frame a history or narrative of the United States, the connection of folklore to American studies held a methodological and theoretical significance. In the introductory textbook *Folklore and Folklife* (1972), Dorson divided the folklore of the Old and New Worlds for analytical purposes. Espousing a nationalistic approach, Dorson asserted that "the folklore of each New World country needs to be analyzed in terms of its ethnic-racial and historical ingredients" (Dorson 1972:44). In addition, he emphasized "special historical and environmental factors that have shaped traditions." Accordingly, in the *Handbook of American Folklore* (1983), Dorson further organized folklore in

relation to American studies. At the outset are “American Experiences” followed by “American Cultural Myths” and “American Settings.” These categories lead to a consideration of “American Entertainments” and “American Forms and Performers” as preludes to the “Interpretation of Research.”

Folklore, Dorson and others argued, was especially convincing evidence because it represented deep-seated values and long-standing beliefs held by a society. Alan Dundes, who had studied with Dorson, especially developed the concept of “folk ideas as units of world view” and examined folk ideas basic to American national character. For example, he made a case for the future orientation of Americans as well as their reliance on the number three (Dundes 1980). He called for American studies to be more comparative and cross-cultural in its use of folklore as evidence of national character.

As the historically oriented Constance Rourke had her detractor in Martha Beckwith, so, too, did Dorson have challenges from folklorists seeking less of a nationalistic connection to American studies. Collections such as *Folklore in America* (1966), edited by Tristram Potter Coffin and Hennig Cohen, and *Folklore on the American Land* (1972), edited by Duncan Emrich (1908–1977), emphasized the continuities of folklore in America with sources elsewhere rather than the existence of a distinctive “American folklore.” Jan Harold Brunvand’s introductory textbook *The Study of American Folklore* (1968) took a middle ground in the debate covering both folklore traditions “found in” America and those “originated” there.

Writing in *American Quarterly*, Richard Bauman and Roger D. Abrahams with Susan Kalcik (1976) reiterated the split between American folklore and folklore in America and surveyed the familiar categories of region, ethnicity, race, occupation, and genre. They closed with attention to “a social interactional perspective, centering around the notion of performance,” that they believed was modifying the traditional organizing principles of American folklorists. Influenced by anthropological approaches to linguistics and communication, in this perspective researchers observed varying individual “performances” of traditional behavior influenced by the immediate sociocultural context. The performance-centered approach led to more consideration of the lives of individual American folk performers and artists from a wide range of backgrounds and the processes for learning and expressing folklore under various American conditions. Thus, Bauman, Abrahams, and Kalcik pointed to studies of biography, repertoire, and performance style of folk performers leading to increased interest in “community, locale, and personal experience as formative influences” in diverse American contexts.

In the attention to community and personal experience, scholars implied a shift in the mission of American studies from one of uncovering, in Rourke’s words, the “common storage of experience and character,” usually centered on literary arts, to one of seeking to describe American lives and identities, centered on everyday cultural practice. This shift suggested leaving behind the issue of whether American traditions were created or imported (seen as a process, they are both), and moved to the complex use of traditions by and for individuals in various settings that are part of American life. Additionally, inquiry followed the ways that Americans carry multiple identities through their lives and the patterns of forming, expressing, and manipulating those identities. This kind of inquiry opened American Studies to global applications, since these identities are in question when Americans or American expressions enter into surroundings outside the United States.

If there has been a trend since the 1970s, it has been that writing on folklore in American studies appeared more “ethnographic.” The basis of fieldwork using interview and observation to describe the communication of symbols among people in contemporary cultural scenes became increasingly important. The ethnographic orientation of folklife and material culture with its uncovering of cultural persistence and diversity was notably added to the folkloristic relation to American studies (Bronner 1992; Glassie 1968). With the addition of folklife and material culture, a rejuvenation of the historical component of tradition was evident, thus forming a new folkloristic synthesis of art, literature, culture, and history (Bronner 1986). Rather than trying to describe America as a whole, scholars turned more attention to describing the complexity of American scenes and people that influence, and have influenced, the sense of the whole and its parts. Thus, studies of Louisiana Cajuns, Pennsylvania Germans, city firefighters, and corporate humorists were all “American studies” that connected to cultural studies in parts of the United States and abroad. Implying the importance of social identities, these studies were complemented by a movement in folklore and folklife research to consider the importance of settings and practices they suggest (schools, workplaces, and leisure spots, for example) within the common scenes of American life.

Particularly in its emphasis on the processes of “tradition” in sociocultural context, folklore and folklife research significantly contributed to American studies by identifying longstanding values and beliefs inherent in socially shared expressions that connect to individual lives as part of the American experience. Judging from the keywords in American studies to describe American life, during the 1970s the anthropological and folkloristic “culture” replaced the humanistic “civilization.” The increasing use of folkloristic terms such as “tradition,” “narrative,” and “folkways” in American studies suggests a more behavioral understanding of American experiences (see Jones 1982). Examining the symbolism of American images and artifacts from wildlife to the New Jersey Turnpike, American-studies scholars have included folklore as a means to analyze the rhetorical meaning of ways that Americans present themselves (Gillespie and Mechling 1987; Gillespie and Rockland 1989).

Another indication of the scholarly appeal of folklore in American studies has been the rise of folklore and folklife courses in American-studies programs and departments from a few in 1971 to 13 percent of all folklore courses offered in the United States in 1986. The previous domination of ballad and song gave way to American folklore and folklife as the dominant folkloristic subject taught in American colleges (26 percent) just behind the introductory course (Baker 1971, 1986). Indiana University allows for a joint Ph.D. degree in folklore and American studies, and George Washington University offers a folklife program within the American studies Ph.D. Other American studies Ph.D. granting institutions, such as the University of Pennsylvania, the University of New Mexico, Bowling Green State University, and Michigan State University, have strong folkloristic components.

In American studies, folklore studies are used to demonstrate the persistence and diversity of America’s social groups and the interplay between folk and popular cultures. In the area of folksong, for example, where previously studies of British-American balladry dominated, significant new research has considered the theme of railroads in American country music (Cohen 1981) and the cultural meanings of blues (Oliver 1984). Ethnic folk music received its due in American studies with studies of klezmer, polka,

and Cajun music. In keeping with the trend toward community and personal experience, many of the newer titles use the keyword of “makers” to draw attention to individual performers in the process of cultural production. Other identities such as age, gender, disability, and sexual preference are the subjects of study in other genres such as legend, humor, and proverb. With the influence of folklife study, American-studies scholarship also has studies that explore a number of different expressions, tangible and intangible, in the round of everyday life within communities.

Besides expanding the range of folklore to folklife concerns of material culture and community life, researchers increasingly seek out the multiple cultures that interact in an American commonwealth. American folklorists increasingly ask questions about the influences of tradition on the behaviors and identities that Americans take on in many settings, organizational and physical, in the United States and abroad. The guiding problem for the relation of folklore and folklife research to American studies no longer revolves exclusively around the simplistic opposition of imported and emergent traditions, an opposition that in its formation seeks to create an American exceptionalism. Instead, the main problem statement concerns the rhetorical uses of traditions from various perspectives—the individual, the community, the region, the nation. The goal of interpreting cultural process and social context historically and ethnographically undergirds many new American studies of traditions. The promise of these studies is their inquiry into the adaptive nature of everyday lives and the ways that these lives represent the American experiences.

Anansi

Also “Ananse,” “Anancy,” and “Nansi,” the spider trickster of West and Central Africa. Anansi is so popular a character in this great body of tales that, even when he does not appear, they are called *Anansesem* (Ananse stories) by the Akan-speakers of Ghana and the Côte d’Ivoire. Although Anansi usually has spider characteristics, to make matters even more complicated for scholars he can also turn into a human, and conversely, other animals such as a rabbit, a fox, and a hare sometimes take over his role in popular stories. Indeed, he was first known to most European Americans as the trickster Brer Rabbit in Joel Chandler Harris’ 19th-century literary retellings of African (and non-African) Uncle Remus stories. Although Anansi stories and other African tales have been collected and published since the first quarter of the 19th century, they reached a wider non-African audience through Cronise and Ward’s *Cunny Rabbit, Mr. Spider, and the Other Beef* (1903), Beckwith’s *Jamaica Anansi Stories* (1924), and Rattray’s comprehensive collection, *Akan-Ashanti Folk-Tales* (1930).

Known from Senegal to Angola in Africa, and throughout the African Diaspora in the Caribbean, northern South America, and the United States, Anansi is ‘Ti Malice in Haiti, Boy Nasty and B’Rabby in the Bahamas, Nansi in Curaçao, Aunt Nancy and Miss Nancy on the Carolina/Georgia Coast, and he can be a girl, a boy, or an old man or woman rather than a spider. In the Anglophone Caribbean, particularly Jamaica and Trinidad, his stories are often told as an entertainment during the overnight rituals associated with wakes for the dead; in Suriname, they are told only at night during wakes.

Most commonly, Anansi is a wily, cunning spider with human abilities such as speech, who uses his insect characteristics such as his sticky web, his eight feet, and his ability to descend rapidly from a ceiling, to attain his goals or save his life. He plots and plans, using every kind of clever and amoral duplicity to satisfy his greed, but he is sometimes outwitted or bested by other animals. Some stories explain how spiders were created, while others feature Anansi as a kind of culture hero who steals the sun for humankind and tricks the sky god into giving him these stories.

One of the most famous Anansi stories is how he tricked Tiger through cajolery, while pretending to be ill and weak, into letting him ride him complete with saddle, bridle, and whip. In another, a farmer catches thieving Anansi by putting a tar baby, or gumdoll, in his field. When the doll does not answer Anansi’s greeting, he slaps it and his hand sticks, then he kicks it when it won’t release his hand, so when the farmer catches him, he beats him flat, thus explaining how spiders came to be flat. Although many of the tales are adult in content, and far from edifying in their trickery, their tremendous range of character and action explains why they have kept their appeal and are constantly being “retold” by writers of children’s books. Even so, African American artist John Biggers, in *Ananse: The Web of Life in Africa* (1962), sees Ananse as depicting “...every kind of hero. There is an Ananse story for every situation in life. God gave Ananse the meaning of order.”

Anecdote

Single-episode, believed folk narrative, especially one centering on a particular individual. The word originally meant “things unpublished or secret” and referred to the actions and sayings of famous people that were not included in their official biographies. Anecdotes often focus on things said in a particularly witty or effective way, such as the line attributed to British Prime Minister Winston Churchill when told by a female member of Parliament that, if he were her husband, she would poison his tea. “Madam,” he is said to have answered, “if I were your husband I would drink it.” As this example illustrates, anecdotes are typically humorous, but they should be distinguished from jokes, which are understood to be fictive by their tellers and hearers. In effect, anecdotes are to legends as jokes are to folktales, shortened or crystallized equivalents; unlike many legends, however, they do not involve the supernatural.

The folk anecdote has parallels in the written literary tradition that go back at least to the great 14th-century English anthology of illustrative stories of the Roman emperors, called the *Gesta Romanorum*, which was printed in Latin. Such “ana,” or published collections of anecdotes, grew to great popularity in 17th- and 18th-century Europe, where they focused primarily on famous living personalities rather than historical ones.

The usual subject matter of serious anecdotal narratives, whether folk or published, is revealed in the headings Stith Thompson’s *Motif Index of Folk-Literature* (1955–1958) gives for the genre—social types and relationships, wise and unwise conduct, and rewards and punishments. The subject matter of humorous anecdotes includes such things as great lies, ludicrous mistakes, escapes, exaggerations, tricks, practical jokes, and especially the well-put or stinging verbal comebacks of clever people.

While anecdotes often concern famous individuals—generals, politicians, kings, actors, and the like—some ordinary individuals gain folk fame based solely on their sayings and deeds that generate anecdotes among their group. The exploits of one Charlie Ferg, for example, which constitute a local genre of folklore in southwest Wisconsin’s Ocooch Mountains, are basically a set of this ne’er-do-well’s one-line responses to judgments against him by community moralists. In one narrative, Charlie stumbled by a group of church members on his way home from a tavern one night, and a deacon asked him if he had found Jesus. “Why no, Deacon,” he replied, “I didn’t know he was lost!”

Besides their entertainment value, both folk and literary anecdotes of this type often serve moral purposes as well, as the following narrative about Thomas Jefferson shows. It was collected by Works Progress Administration (WPA) workers in Virginia in the 1930s: “Jefferson with one of his friends was in a town near Washington while he was president and met an old colored an’ weather-beaten slave, who bowed nearly to his knees to him. The President in turn bowed to him and spoke kindly to him and drew him into conversation. He saw that the military officer with him did not like the idea of his talking to the old negro so kindly, so he said ‘Shame on you my man, I would not want an aged slave to have more manners than I. And furthermore, he was more polite to me than you are to disapprove of my behavior.’” Testimony to the folk nature of this

anecdote is the fact that it is printed in Booker T. Washington's *Up from Slavery* attributed to George Washington and in Benjamin A. Botkin's *Treasury of Southern Folklore* (1949) attributed to Robert E. Lee. While, as this indicates, anecdotal narratives do float, they tend to attach themselves to individuals of similar characteristics, such as the "great gentlemen" named above, or to men such as Albert Einstein and Bertrand Russell as representing the type of "the genius." Both men are said to have been approached by beautiful women to have sex with them—to bear a child with "my body and your brains." Each man is said to have replied, "What if [it] turns out the other way around?"

There are vast numbers of folk, popular, and literary anecdotes in circulation. Perhaps the anecdote is such an active genre of narrative in American society because of its brevity and focus on individual personality, both of which are amenable features to contemporary culture.

Anglo Americans

Arguably the largest and most influential group of Americans sharing an ethnic heritage, yet for that very reason the least self-identified and least likely to be perceived as an ethnic group. The predominance of the English among the earliest American settlers; the consequent distance in time between many contemporary English-surnamed Americans and their original English emigrant ancestors; the extensive adoption and adaptation of English beliefs, practices, institutions, and language in the United States; enmity between Great Britain and America throughout the 19th century; and the universal tendency of dominant social groups to perceive themselves as the norm and only others as “ethnic” have all militated against identification of Anglo Americans as a culturally distinct group within American society. Americans of English descent have more cultural sanction than persons of other backgrounds to consider themselves simply “American” rather than “Anglo American.” Similarly, English folkways that have survived in the United States have been reidentified as American rather than English.

In comparison to their likely numbers by some measures, Anglo Americans are under-represented as a self-identified ethnic group. Indeed, they are nearly invisible in the United States today. Ascertaining the size of any ethnic population is necessarily problematic and the process is especially complex in a country like the United States where the philosophy of the melting pot (although periodically challenged by xenophobia and prejudice) has made intermarriage among the many different emigrant groups relatively easy, so most citizens trace a multi-ethnic ancestry. More importantly, in any country, ostensibly objective measures like the sources of surnames or even the national origin of ancestors (if discoverable) may not correspond with the determinative factor, the individual’s self-identification as a member of a particular group. Individuals who identify themselves as members of an ethnic group must perceive that this will confer benefits that will more than compensate for the disadvantages of being seen by others as “ethnic,” that is, non-mainstream.

For persons of English descent in the United States, except for very recent arrivals, there is and has been little need or reward for identifying oneself as Anglo American. In the 1990 Census, respondents were asked to report the ancestry group or groups with which they most closely identified. Out of the total U.S. population of 248,709,873, 32.7 million people claimed English ancestry (13%), the third largest group after German: 57.9 million (23%), and Irish: 38.7 million (15.5%). Another 12.4 million (5%) said their ancestry was “American.” Given the preponderance of the English among early emigrants and thus among the longest-settled American families and the preponderance of English surnames in many parts of the country, it appears that Americans with English ancestry are less likely to see that as a significant part of their current identity than do those with ancestral connections to other nationalities. In folklore fieldwork, researchers commonly find that persons asked to identify their ethnic heritage will name other ancestry (regardless of the extent to which they actually retain the traditional practices of

a particular ethnic group), but if their background is mostly English (or to a lesser extent from the rest of the British Isles) they will label themselves “plain white American.”

During the 17th century English emigrants formed the great majority of arrivals in the American colonies. Protestant dissenters fled the religious persecution that was not legally rescinded in England until 1689. In the southern colonies, farm laborers, domestic servants, and artisans seeking to improve their fortunes could make a start in the new world without capital by going into indentured service. Not until the 1680s did increased importation of African slaves displace English emigrants for plantation work. During the 18th century, the balance of emigration shifted so that the number of French, Germans, Scots, and Scotch-Irish arriving in the colonies together exceeded the number of new English arrivals. Population grew fastest during this period in the middle colonies and by the end of the colonial period more than half the inhabitants of Pennsylvania were not of English birth, but in most areas the English still formed between 60 percent and 80 percent of the white population. In the course of one hundred and seventy years of colonial rule the English language as well as many aspects of English common law, the tradition of representative government, the acceptance of multiple Protestant sects, and English trade practices became firmly ensconced. Despite modifications required by new circumstances, the heritage of the majority of inhabitants and the continued colonial linkages with Great Britain assured the establishment of an essentially English culture.

The struggle for American independence, the Revolutionary War, and the bitter War of 1812 not only severed the legal connection between mother and daughter countries, but ushered in a century of enmity and rivalry between the United States and Britain. It was only during World War II that the special relationship between the two countries, which now feels timeless and inevitable, was reestablished. Alexis de Toqueville, chronicling the unique character of Americans and their democratic experiment, remarked that it was difficult to imagine a more intense hatred than that of Americans for England. The similarity of worldview and shared cultural heritage remained, but the 19th century was the time in which Americans set out to forge a separate cultural identity. Americans envied English eminence both in commerce and in culture and desired to supplant their mother/rival in both. In the realm of commerce, England could and did place obstacles in America’s path. While resenting the interference, American business sought its own success by emulating the English model and establishing duplicate institutions. In the realm of culture, in contrast, Americans rejected the English heritage. “Our day of dependence, our long apprenticeship to the learning of other lands, draws to a close,” wrote Ralph Waldo Emerson in “The American Scholar” (1837). And Walt Whitman, in the 1855 Preface to *Leaves of Grass*, predicted that America would inspire new poets to create a new and superior literature, neither partisan nor nationalistic nor parochial, but built on healthy, natural models. Developments in the course of the century fostered general awareness of a distinct American language and a distinct American brand of humor as well as a desire not only to create arts to represent the American landscape and society but to do so in a distinct and appropriate American style (see Spencer 1957 and Crapol 1973).

In such a climate, American citizens of English ancestry tended to jettison any lingering sense of ethnic affiliation and to identify themselves as purely “American” and their accomplishments as contributions to American society. Entries in

this volume on other American ethnic groups enumerate the names of group members who played important roles in the development of American society. The same might be done for Anglo Americans, from the scholars of early New England to the Founding Fathers to the most influential authors of the new American literature to 19th-century

industrialists and Suffragists, except that all of these consciously acted not as members of an ethnic subgroup, not as persons of English extraction, but as Americans centrally defining what America and Americans should be.

The hatred of England that flourished during the 19th century was focused, however, on the British government and British commercial interests. Individual English men and women who emigrated to the U.S. in several economically-influenced waves were rarely penalized or judged too harshly because of their place of origin. Commonality of language, religion, customs, and institutions made for ease of contact and rapid acceptance and intermarriage between English emigrants and native-born Americans. In rural areas in the Midwest, English colonies and churches rarely survived with that identity for more than a generation or two unless there was a substantial influx of additional English people to the same area. Fast-growing western cities offered the English opportunities for upward mobility that also militated against ethnic organizing. In eastern cities St. George's Societies were longer-lived, but were relatively uninfluential as well as limited to a small elite. Only in the mining and industrial districts of the East were the English successful in founding institutions (often to distinguish themselves from the Irish), but these trade unions, cooperatives, and lodges were inherently more class- than ethnicity-based, so those that thrived quickly lost their all-English character. English workers also were more likely than other emigrants to move up in the class hierarchy, which further discouraged the maintenance of strong ethnic ties. By the end of the century the English had a far less organized social institutional life than the other large emigrant groups of the time, the Irish and Germans (see Erickson 1972 and 1980).

Along with more formal institutions like English legal practices, many English crafts and folkways were transported to this country and many survive. Those that have been retained as mainstream traditions, however, have mostly been stripped of their ethnic associations. Who now recalls that Christmas carolling was originally an English practice? Even in rural communities where more elements of traditional English culture were preserved for longer, practitioners of the traditional arts came to see them as American after a few generations. Folklore scholars may recognize a North Carolina version of "Barbara Allen" as an originally English text and tune given a few American details, but neither the singer from whom it was collected nor the general public with whom it has been popularized by revivalist performers is likely to think of it as anything but American. The same can be said for many ballads, songs, and fiddle tunes from the British Isles, as well as Jack Tales, quilting techniques, split white oak basketry, and the contra dancing developed from English country dancing. Contemporary folklore theory would argue that a practice adapted and perpetuated in a new country should be regarded as a part of the folklore of that country rather than only of the source country. Customs from other sources have also undergone a similar Americanization process: consider the African banjo and the German Christmas tree. Nevertheless, English customs and crafts seem most readily detached from their origins, perhaps because they are associated instead with an internal pseudo-ethnic group, Appalachian people.

In the late 19th and early 20th centuries, there was a resurgence of interest among middle- and upper-class Americans in the preservation of English bloodlines and old English traditions in the United States and an interest in Appalachia as a repository of both. This concern was constructed, however, so as to emphasize the supposed superiority of the English heritage (social and genetic) with which most "mainstream"

Americans would implicitly identify themselves without explicitly connecting the elite, professional, and business classes of the North and Midwest with poor Appalachian mountaineers nor in any sense classifying the bulk of Americans of English descent as an Anglo American ethnic group equivalent to other ethnics. As western European emigration slowed and increasing numbers of poor immigrants from eastern and southern Europe arrived in the United States toward the end of the 19th century, xenophobic and racist elements complained of the “pollution” of the American genetic pool and advocated the uplift and incorporation of Appalachian people because they could supply a fresh stream of citizens of “the very best American type,” (that is, of Anglo-Saxon genetic heritage).

A number of the philanthropic efforts aimed at improving the lot of Appalachian people were based on the assumption that these people (until touched by recent modern influences) had retained an essentially old English culture and would thrive if they could be restored as an Anglo American folk enclave. Appalachian scholars now see these schemes as misguided, especially to the extent that they sought to “return” mountain inhabitants to a mythical simple, wholesome, preindustrial English rural lifestyle. Attempts to get contemporary mountaineers to carve and weave and dance English ritual dances and sing only the old songs impeded the people’s own efforts to acquire the skills necessary to advance in a changing marketplace. This construction of events in the mountains also obscured political awareness that the supposed “corruption” of a rural folk by modern culture was a less serious problem than the depredations of huge timber and mining companies that exploited local resources without regard for the well-being of the inhabitants. While the antique quality of Appalachian culture was celebrated, those who made a good living from the culture were the musicians who parlayed their skills into the uniquely American form now known as Country Music (see Whisnant 1983).

The nascent field of American folklore study played a part in the identification and paradoxical definition of Anglo American culture in the late 19th century. The English ballad scholar Cecil Sharp and others following his lead discovered remnants of English traditional music in the Appalachians, thereby bolstering the public sense that this was a bastion of Anglo American culture. At the same time, folklorists drew a distinction between English folklore in America and folklore from other sources. The lead article in the first issue of the *Journal of American Folklore* (1888) advocated:

The collection of the fast-vanishing remains of Folk-Lore in America, namely:

- (a) Relics of Old English Folk-Lore (ballads, tales, superstitions, dialect, etc.).
- (b) Lore of Negroes in the Southern States of the Union.
- (c) Lore of the Indian Tribes of North America (myths, tales, etc.).
- (d) Lore of French Canada, Mexico, etc.

It was entirely in keeping with the theories of the day to regard folklore as something produced only in Europe or only by peasants and thus as something that existed in America only in the form of survivals that could not last. Notably, however, the *JAF* statement of purpose identifies African Americans, Native Americans, French Canadian Americans and Mexican Americans as peoples possessing as a group their own proper (and living) lore. In contrast, Anglo Americans are not named and “Relics of Old English Folk-Lore” are presented as existing entirely independently of any folk community. There might be English lore existing among the general population, but that did not make

these people (unless they were Appalachian mountaineers) Anglo American ethnics or Anglo American folk.

One should also note that in practice the term “Anglo American” is not necessarily restricted to persons of English descent. In general usage and even in scholarly usage it is often employed as a more euphonious alternative to “British American.” Thus “Anglo American folksongs” includes songs of Scottish and possibly Irish origin. Likewise works on the migration of English, Scots, Irish, and Scotch Irish settlers into the Appalachian region sometimes differentiate the streams but often lump the groups as Anglo American. In Texas and the Hispanic Southwest, the abbreviated version, “Anglo,” is applied to indicate any person of other than Hispanic descent and may thus be used to refer not only to European Americans of other than English descent, but also to African Americans.

The invisibility of Anglo Americans is a complex political and historical phenomenon, resting equally on the predominance of English cultural influences in the formative years of the nation, the need of the daughter country to create a separate identity from her mother, and the tendency of dominant groups to see themselves as unmarked and others as ethnic. Even today, with the upsurge of ethnic pride movements and the institutionalization of anti-racist practices, a curious relation to the English component of our national heritage persists. Not only in Canada, where the linkages to English culture are more recent and obvious (see Greenhill 1994), but also in the United States, the mainstream implicit assumption of superiority rests to a considerable, if diminishing, extent on identification with the original English cultural and genetic heritage, while this identification must be erased or denied and people of English background must be cast as non-ethnic to preserve their rights to dominate the society.

Animals

Fauna of North America and their related lore. At every level of American culture, from the casual joke or Saturday morning cartoon to the serious novel or scientific monograph, animals—especially wild animals—have always exerted a special imaginative appeal. Scholarly work by American folklorists demonstrates that, throughout our history, symbolic uses of distinctively American wild animals have expressed national attitudes about such crucial matters as politics, race, gender, sex, and danger.

The folkloristic sources of the ideas, images, and stories about wild animals are many, but we may distinguish seven types: conversational genres, oral narratives, children's literature, popular culture, performances, elite culture, and scientific writing.

First are the shorter conversational genres most central to our commonsense knowledge of the world. These are the jokes, proverbs, riddles, superstitions, and so on that constitute much of the everyday discourse by Americans about wild animals. Embedded in and expressed by these genres are "folk ideas," the basic units of belief about objects in the world. For example, jokes about armadillos often involve people unwittingly eating them; the underlying idea is that armadillos are not edible. Likewise, jokes about alligators often involve people being eaten by them; the underlying idea is that alligators are dangerous. Proverbial expressions, including the humorous versions such as "It's hard to soar with eagles when you work with turkeys" or "...up to your ass in alligators," similarly encode metaphorical connections between folk ideas about animals and human social situations.

Also a folk genre is oral narrative, the second source of ideas about wild animals in America. This genre includes the true "stories" people pass on to explain to one another the meaning of a wild animal. It is also the category that has been treated to the most folklore scholarship. Myths are the longest genres of this sort, and there are many Native American myths involving such animals as the coyote, armadillo, or bear. For some animals, there exist folktales from Native American, African American, and European traditions. We also find "encounter stories" (relating the narrator's encounter with a wild animal) among amateurs and professionals alike. A park ranger is as likely to have a repertoire of stories as is a tourist-attraction announcer or a hunter holding forth in a local tavern.

The third source of ideas about wild animals is children's literature, the printed stories and accompanying illustrations that provide a repertoire of ideas and images for making sense of all sorts of animals. Some children's literature is little more than a printed version of the traditional oral narratives, and some is original. Authors of children's books seem especially disposed to use animal characters in lieu of human ones. Like the folk genres, this written, visual source of ideas is powerful because its influence begins so early in the creation of the child's map of the everyday world. It is powerful, too, because of its visual component, the illustrations accompanying the children's stories. All the more powerful is the transformation of animal illustrations into three-dimensional toys, such as the Teddy Bear or Winnie-the-Pooh. Thus, a persistent problem for the rangers at Yosemite and Yellowstone National Parks is that Americans tend to approach real bears as if they were the storybook kind. Rangers refer to this phenomenon as "the Bambi complex"—which suggests the fourth main source of ideas about wild animals.

Popular culture (also known as mass-mediated culture or commercial culture) is an increasingly important locus of such ideas and images. Included in this category are postcards, souvenirs, cartoons, comics, television commercials, print advertising, theatrical films, and mass-circulation magazines. Popular culture provides a repertoire of stories and images accessible to a wide audience, crossing gender, ethnic, and social-class divisions. Popular materials from commercial culture can be found in abundance from the Warner Brothers cartoon character Wile E. Coyote to advertisements for Wild Turkey bourbon to a theatrical film like *Alligator* (1980).

The fifth source of ideas, images, and stories is the performances that involve somehow an interpretation of a wild animal. These are the participatory drama-like events that include tourist attractions, festivals, museum and zoo programs, hunting expeditions, cooking and foodway events, and the like. Oldest in this category are the Native American performance rituals and dances that involve the armadillo, the coyote, the bear, and the rattlesnake. The snake handling in certain religious communities is a related phenomenon.

The sixth source of our notions about animals is elite culture, the body of literature and fine arts that is the usual subject matter of humanistic study. Fine painting, poetry, novels, and short stories in America often feature wild animals as central symbols in the imaginative landscape of their fictive worlds. But even here folk ideas are often present, though recast in more elegant language. Herman Melville's white whale and William Faulkner's bear are only the best known cases. Poets Gary Snyder and Simon Ortiz find the coyote an especially attractive figure, and novelist Thomas Pynchon uses the alligators-in-the-sewers legend for his own artistic purposes in his novel *V*. In American elite art, we can trace the iconography of American wildlife from the earliest European renditions through the likes of John James Audubon and John Singer Sargent up to the present.

It will surprise some to learn that scientific discourse is the seventh source of American ideas about wild animals. So accustomed are we to think of scientific writing as "fact," opposed to folk and popular "fiction," that we fail to appreciate how cultural is the history of American scientific writing about wild animals. Some scientific writing is the source of, or at least perpetuates, the oldest folk ideas about animals, and, even when a scientific treatise takes space in its historical account to "debunk" the "myths and fallacies" about the animal, the author is acknowledging tacitly that the starting point for American understanding of the beast is a repertoire of folk and popular beliefs concerning it.

Anniversaries

Annual rites of passage celebrated privately or publicly according to cultural preferences. Anniversaries represent cyclical time measurement; the most common anniversaries are wedding and birthday celebrations and commemorations of important historic dates, especially centennials of significant events.

Wedding anniversaries are traditionally recognized with gifts of flowers and special items. Popular beliefs endorse specific gifts to bring good luck according to how many years the couple has been married. Materials such as metals and minerals symbolize the couple's marriage commitment in terms of years. Following German tradition, these anniversaries are frequently referred to by the gift given, such as "silver anniversary."

The commonly accepted anniversary gifts for significant anniversaries are these: one year, paper; five years, wood; ten years, tin; fifteen years, crystal; twenty years, china; twenty-five years, silver; thirty years, pearl or ivory; thirty-five years, coral; forty years, ruby; forty-five years, sapphire; fifty years, gold; fifty-five years, emerald; sixty and seventy-five years, diamond.

The most prominent anniversaries celebrated include the silver, golden, and diamond weddings. Less significant anniversaries also have prescribed gifts, although these are infrequently observed. They include, two years, cotton; three years, leather or muslin; four years, silk; six years, iron; seven years, copper or wool; eight years, electrical appliances; and nine years, pottery.

Anniversary gifts may be practical, luxurious, and even silly variations of the prescribed anniversary motifs. Any items composed of the material for the designated anniversary, such as clothing, tools, toys, or other household goods, are given. Most couples celebrate anniversaries of their nuptials privately, but anniversaries of royal and celebrity couples often receive great publicity and ceremony with political overtones.

Additional anniversary traditions include burning a tall, white memory candle that smells like lily of the valley, a traditional wedding flower. Presented at the wedding reception, a candle burned only annually may last through the golden anniversary. Some women display or wear their wedding gowns at anniversary parties, and the original wedding party and guests may be invited to attend, along with the official who performed the ceremony. Portions of the wedding cake are often saved to eat at anniversary parties (and at christenings) to symbolize that the marriage has lasted and matured.

Birthday anniversaries are celebrated annually for children with parties, presents, and games. Traditions such as spanking once for each year and an extra pat to grow on as well as pinch day, kiss day, and the like are observed. Elaborate birthday celebrations are staged for significant stages of maturity, such as turning twenty-one, reaching full adulthood, or forty years of age, marking the beginning of middle age.

Anniversaries of historic events, usually commemorating military battles, tend to generate patriotic traditions, including the placement of flags in significant locations, such as on graves for Decoration Day. These anniversaries are also occasions for the preservation of historic sites, the commercialization of the event with commemorative

items, or the reiteration of folklore glorifying national heroes like George Washington or Abraham Lincoln.

Anniversaries of death dates are sometimes mentioned in commemorative newspaper ads, and they enter modern folk culture with the common tales of “The Vanishing Hitchhiker,” often a young woman picked up near a cemetery, who is attempting to return home on the anniversary of her death.

Anthropological Approach

Folklore as anthropologists have studied it—as part of culture. In the 19th century, when folklore was established as a subject worthy of investigation, the orientation of American scholars to its study was greatly influenced by the presence of the American Indian. The collection of American Indian mythology was deemed a proper enterprise for those interested in folklore. On the Continent, the study of folklore was defined as the study of the peasant populations of Europe, while the study of American Indians or other non-European peoples, who were classified as savages or primitives, was considered to be the domain of the ethnologists. The differing orientation was critical for the development of American folklore scholarship since it designated the study of native peoples as a suitable subject for folklore as well as for anthropology.

American anthropologists, in carving out their discipline, developed a more restricted definition of folklore than did scholars in literature, but a more inclusive view of the folk. Folklore was given a specific place within anthropology, that of oral literature. Anthropologists, who traditionally worked in cultures without writing, could not designate folklore as that which was oral, since that would include all aspects of culture. As Erminie Voegelin elaborated the point, orally transmitted prose and verse forms were “myths and tales, jests and anecdotes, dramas and dramatic dialogues, prayers and formulas, speeches, puns, riddles, proverbs, and song and chant texts” (Voegelin, 1949–1950:403). William R. Bascom simply designated the same area as “verbal art” (Bascom 1955). The folk could be Euro-American, African American, or Native American, though the anthropological folklorist usually studied the latter to the exclusion of the two former groups. Significantly, the anthropological folklorists, merely by their choice of the group to be studied, had succeeded in broadening the concept of “folk” to include a non-European component.

The anthropological folklorists studied folklore as a part of culture—a way of learning more about the culture history, as with Franz Boas, or a way of learning more about the patterns of culture, as with Ruth Benedict. For the anthropological folklorists, the questions were not directed to folklore per se, but rather to culture: What is the nature of culture? and How is this reflected in the folklore?

Deemed crucial for the anthropological folklorists was the collection of detailed narrative texts. The goal was twofold: first, to make an accurate record of the language; and, second, to study the culture as it was reflected in the narratives. Boas’ work on Northwest Coast Indian cultures is an example. In *Chinook Texts* (1894), *Tsimshian Mythology* (1916), *Kutenai Tales* (1917), and *Kwakiutl Culture as Reflected in Mythology* (1935), Boas recorded the narratives phonetically in the native language, and translated them interlineally. The texts were, as Gladys Reichard remarked, “Boas’ self-built monument.”

The anthropological folklorists were likely to compile their material by focusing either on a single culture or on several cultures. They might also study a single aspect of folklore as it was manifested in several cultures. Elsie Clews Parsons’ *Pueblo Religion*

(1939) and Benedict's "The Concept of the Guardian Spirit in North America" (1923) exemplify this comparative approach. On occasion, the anthropological folklorist focused on a genre of folklore. For example, Paul Radin wrote *The Trickster: A Study in American Indian Mythology* (1955), and Benedict produced two volumes on *Zuñi Mythology* (1935). However, Radin's and Benedict's works were not intended as investigations of folklore genres—a concept that was not used by the anthropological folklorists—but rather as explorations in cultural patterning.

The emphasis on cultural patterns was critical for the shift that took place in American anthropology, a shift from an earlier focus on detailed description to a focus on theme and meaning. Thus, folklore manifested certain themes that resonated in other areas of culture as well. In Benedict's terms, it was part of the personality of the culture. Benedict, Radin, and Melville Jacobs were the innovators in this approach to folklore. Their contributions had an impact that continues to reverberate in folklore theory. The three were characterized by Robert H. Lowie as scholars of folklore who were "not averse to psychoanalytic interpretation" (Lowie 1960:467). Together they sparked the psychological interpretation of folklore. This innovation in folklore studies combined three approaches: the psychological, the cultural, and the folkloristic.

Anti-Legend

A term proposed in 1930 by Andre Jolles in his book *Einfache Formen* and brought into use in American folklore scholarship by Linda Dégh. In her examination of the processes of legend formation, Dégh utilized the metaphor of a conduit. Within a network of legend tellers, what she called the “legend conduit” circulates numerous oral versions of a given legend. Having determined that narrators will hold an array of attitudes ranging from acceptance through skepticism to outright opposition, she argues that those at the negative end of the spectrum are likely to transform the story into an anti-legend; that is, they will attempt to undermine the credibility of the story in order to impugn its veracity and to mock those who might be inclined to find the story worthy of retelling as true. Tactics used include rationalizations, alternative explanations, and the citation of supposed higher authorities. A committed narrator’s judgment might even be questioned, and his or her belief might be mocked as silly superstition.

Since humor is one of the most effective means of challenging a fervent belief, some legend narratives are transformed into jokes or comical narratives. Often these stories, resembling catch tales or shaggy-dog stories, will turn on a surprise ending that catches the listener off guard. Having lured listeners into the story by the presentation of a series of plausible situations or credible details, in the end the “punch line,” frequently a pun or a parody of a well-known saying, reveals that the whole narrative was fallacious and the listener an unsuspecting dupe. For example, a story of an encounter with a ghostly revenant that pursues the narrator as he or she attempts an escape might conclude at the seemingly most harrowing moment with the eerie creature grabbing its victim only to say: “Tag you’re it.” Or a mysterious voice crying out in mournful tones: “One black eye” might be stopped with the smart-aleck retort: “You better shut up or you’ll have *two* black eyes.” The warnings offered by such tales are manifold; listeners are not only informed that the veracity of a particular belief (ghostly or spirit apparitions) is suspect, but they are further encouraged to dismiss legends altogether as foolish tales. The anti-legend, then, challenges both legend content and the social significance of the narrative genre as well. The efficacy of such attempts to overturn entrenched beliefs is questionable. The public appetite for tales of mysterious apparitions, strange voices in the night, and other baffling events continues to be insatiable. Indeed, many of these tales are essentially anti-legends minus the comical ending. Within the flow of the legend conduit, an anti-legend can readily be transformed into a belief tale.

Appalachia

Physiographic region embracing West Virginia and parts of eighteen other Eastern and Southern states. Appalachia, in cultural history, includes three hundred counties covering most of West Virginia and the Blue Ridge and parts of Alabama, Georgia, Kentucky, Tennessee, Maryland, North and South Carolina, and Virginia. The region is also called the Southern Highlands, the Upland South, and (in colonial history), the Back-country. Richard M. Dorson called Appalachia “folklore’s natural habitat.” “Of all of the distinctive regions in the United States,” he wrote, “the one most customarily linked with folklore is the southern Appalachians.” The idea that Appalachia is a reservoir of American folk culture originated with the local-color movement of travel and fiction writers of the late 19th century and persisted through the development of folklife studies as a professional enterprise. By the close of the 20th century, the centrality of Appalachia in the definition and study of folklife had receded, but folklife forms still provide icons that set apart the region from other parts of the United States. Lacking conventional political boundaries and regionwide economic or social institutions of the sort that help define regions such as New England or the West, Midwest, or South, Appalachia is nearly always represented in popular culture by some sort of reference to folklife, usually folk music or crafts.

Nineteenth-century writers created an inventory of cultural expression and deviant behaviors that signified Appalachian “otherness” to metropolitan audiences; these included speech and dialect, log architecture, folk music and dance, handicrafts, woodcraft, superstitions and religious practices, moonshining, illiteracy, and a reliance on “folk justice,” most dramatically in a series of “mountain feuds” given sensational coverage by the metropolitan press. Four influential books of the early 20th century both critiqued and codified this repertory and marked out paths that later generations of professional folklorists would follow in the region. Emma Bell Miles’ *The Spirit of the Mountains* (1905) offered a sympathetic and contextual portrait of mountain people, with emphasis on the expressive culture of religious, social, and domestic life and on the role of women as “repositories of tribal lore—tradition and song, medical and religious learning.” Horace Kephart’s *Our Southern Highlanders* (1913) elaborated upon Miles’ portrayal of men as the bearers of outdoor traditions associated with farming, hunting, and woodcraft and attempted to balance the sensationalism that journalists had attached to the subjects of moonshining and the so-called mountain feuds. John C. Campbell’s *The Southern Highlander and His Homeland* (1921) offered a magisterial survey of Appalachian geography, history, and culture, into which was incorporated the folksong researches of his wife (and posthumous editor) Olive Dame Campbell. *English Folk-Songs from the Southern Appalachians* (1917) was the product of collaboration between Olive Dame Campbell and Cecil Sharp, an English folklorist who made three extensive collecting expeditions (1916–1918) and gathered 1,600 folk songs in North Carolina, Virginia, West Virginia, Tennessee, and Kentucky.

Meanwhile, academic interest in ballad texts made the second and third decades of the 20th century a “golden age” of folksong collecting in the mountains, with such active collectors as C. Alphonse Smith and Arthur Kyle Davis, Jr. in Virginia, Frank C. Brown in North Carolina, E. C. Perrow, Josiah H. Combs, and Hubert G. Sherin in Kentucky, and John Harrington Cox in West Virginia. Cox’s *Folk Songs of the South* (1925) established a model for the academic publication of folksongs, which was reinforced by the expanded publication of Sharp’s collection in two volumes in 1932. State folklore societies established in Kentucky and North Carolina in 1912, Virginia in 1913, and West Virginia in 1915 grew out of the collectors’ focus on folksongs, as did the establishment of the first folk festivals in the region, at Asheville, North Carolina, in 1928 and White Top Mountain, Virginia, in 1931. The development of recording equipment made it possible to focus upon tunes as well as texts, and anxiety that radio and the burgeoning recording industry would somehow dilute the purity of “authentic” folk expression lent urgency to this project. Robert Winslow Gordon began his ambitious scheme to create a national collection of recorded folksongs with an expedition to western North Carolina in 1925. His subsequent success in establishing the Archive of American Folk Song in the Library of Congress allowed him to claim in 1930 that “The Government recognizes the hill-billy and the American Negro as the basis of American folk-song and music.” Gordon’s successors at the Library of Congress and other federal agencies during the 1930s expanded the scope of collecting in the region, adding topical songs to the canon, along with mining and other occupational folksongs and folklore. Two additional influential works that appeared in the 1930s were George Pullen Jackson’s *White Spirituals of the Southern Uplands* (1933) and Allen Eaton’s *Handicrafts of the Southern Highlands* (1937). Eaton’s work led to the creation of the Southern Highlands Handicraft Guild and an official outlet for mountain crafts along the Blue Ridge Parkway near Asheville.

In addition to codifying genres and contexts for folklife study in Appalachia, Miles, Kephart, and the Campbells also amplified two other tendencies that shaped the perception of Appalachia as a cultural region. One was the habit of generalizing about the entire southern Appalachian region, regardless of the geographic limits of a given investigator’s research. Kephart, for example, spent almost all of his time in the mountains in or near Swain County, North Carolina, but he did not hesitate to echo Miles’ claim that “throughout the highlands...our nature is one, our hopes, our loves, our daily life the same.... “The mountaineers are homogenous so far as speech and manners and experiences and ideals can make them” (Kephart 1913) he wrote, an assertion that belied careful distinctions drawn elsewhere in his and Miles’ work between prosperous “valley people,” “the average hillman,” and impoverished “branch-water people.” This tendency reinforced the presumption that, no matter how carefully a researcher’s conclusions were qualified or how sharply the research might be focused upon a particular genre or on the folklife of a particular locality or even of a particular family, they would be interpreted as documentation of a regional folk culture. Thus, Leonard Roberts wrote in introducing his *Sang Branch Settlers: Folksongs and Tales of a Kentucky Mountain Family* (1974) that “the fundamental conclusion is that, although a geopolitical history of Appalachia has not yet been written, perhaps never can be or need not be written, the

region's oral literature and folkways reveal it to be a rich repository of British and European culture."

John C. Campbell's more systematic approach to regional analysis led him to emphasize the importance of "constant qualification" in generalizing about the mountains, but he (and particularly Olive Dame Campbell) contributed to a second tendency—an instrumental view of folklife, valuing it in relation to its usefulness in advancing other projects, such as the "folk school" established in Brasstown, North Carolina, by Campbell in her husband's memory in 1925 as the centerpiece in a program of rural uplift. Earlier, at Berea College in Kentucky and in numerous settlement schools established in the region between 1895 and 1925, educators and missionaries had created "fireside industries" and instructional programs in handicrafts and folk music and dance as an adjunct of moral instruction and vocational education. During the 1930s, conservatives promoted folk festivals as engines of economic development and the preservation of "Anglo-Saxon" culture, while liberals and radicals incorporated folk music into the tool kit of labor organizers and expanded collecting under the auspices of the employment programs of the Works Progress Administration (WPA). Federal agencies such as the Tennessee Valley Authority, Great Smoky Mountains National Park, and the Blue Ridge Parkway used folk artifacts such as log buildings and hand tools to

create quaintly flattering frames to showcase their modernizing activities, while systematically driving mountain people from their homes and destroying artifacts (such as frame buildings of Cades Cove or the gasoline-powered generating equipment of Mabry's Mill) that conflicted with the image of Appalachia as a folk culture.

After World War II, Appalachian folk music was adapted to the needs of the urban folk-music revival of the 1940s and 1950s and the construction of alternative lifestyles for disenchanting young people during the 1960s. In the 1970s, folk music became a favorite tactic of community organizers, while Eliot Wigginton's Foxfire program of Rabun Gap, Georgia, reintroduced folklife study and publication as a pedagogical tool in remote mountain settings. Inspired in part by the commercial success of the Foxfire publications, folk festivals expanded to embrace crafts and storytelling as well as a variety of traditional and commercial musical genres and became a standard component in tourism promotion in most of the Appalachian states.

This instrumentalism—and the consumerism that has often grown out of it—presented a challenge to professional folklorists who believed, with Thelma James, that “the truest values of folklore are entertainment for the participants or...materials for cultural studies by the scholar.” Students of Appalachian folklife during the postwar era, and particularly since the 1960s, have responded to this challenge in two ways. Some have rejected the policing of boundaries between folk and popular culture by exploring and documenting the interpenetration of folk and popular genres, as in the work of Archie Green on coal-mining songs and D.K. Wilgus, Bill C. Malone, Neil V. Rosenberg, and Robert Cantwell on the folk roots of commercial country music. Another response has been to expand beyond research on music, crafts, and tales in favor of genres that do not lend themselves to “commoditization.” Examples are Jeff Todd Titon's (1988) and Thomas Burton's (1993) studies of religious music, preaching, and worship as folk performance, Michael Ann Williams' (1991) reconstruction of vernacular housing as the patterning of interior and exterior space rather than as a set of architectural artifacts and building techniques, Lynwood Montell's study of “folk justice” and interpersonal violence, and the growing number of studies that explore the African American roots of Appalachian cultural forms. The work of Williams, Montell, and Patrick Mullen are examples also of the increasing influence of oral history in folklife scholarship and of a renewed interest in topics, such as the gender and age-related dimensions of folk culture, that were first raised by Emma Bell Miles in the early 20th century. At the same time, folklife research is of increasing interest to scholars in other disciplines. A notable example is historian David Hackett Fischer's *Albion's Seed: Four British Folkways in America* (1989), which defines Appalachia as one of four colonial hearths of American culture and defines its culture, both in its transplantation from Great Britain and Ireland and in its evolution in the United States, almost exclusively in terms of folkways such as speech, dress, gender relations, marriage customs, and child-rearing practices, foodways, naming practices, domestic architecture, religion, superstitions, plus the familiar triad of illiteracy, moonshining, and feuds. This ambitious work also exemplifies another trend: that of defining the core of Appalachia in a broader cultural region that extends across the entire Upland South to the Ozarks, north Texas, and the Anglo-American component of the desert Southwest. While such a view is controversial, it is likely to ensure that the pivotal role that folklife has played in studies of Appalachia as an American region will continue for many decades to come.

Applied Folklore

An approach that advocates the use of folklore materials to foster social, economic, and political change. The targeted constituency includes communities, work environments, and institutions such as schools, churches, and hospitals. Applied folklore used the paradigms of applied anthropology as a model, and each grew out of the social and political milieu of the mid- to late 1960s.

During the later 1960s and early 1970s, a group of folklorists formed an Applied Folklore Section within the American Folklore Society, to share concepts in the formation of theories, techniques, and methodologies. As with applied anthropology, members of the Applied Folklore Section labored hard toward an acceptable definition that would adequately represent the paradigms within which those involved would operate. In 1971 a Middle Atlantic Conference on Folk Culture was held in Pittsburgh, the main theme of which was applied folklore. The following definition was used at this conference: "...the utilization of the theoretical concepts, factual knowledge, and research methodologies of Folklorists in activities or programs meant to ameliorate contemporary social, economic, and technical problems." This definition called directly for change and implicitly placed the folklorist as a necessary catalyst in fostering that change.

Clearly, inherent within the first definition of applied folklore are problems of one's personal orientation and bias. For instance, *who* would identify these "contemporary social, economic, and technical problems?" In addition, the rhetoric did not define the role of the communities, institutions, or structures involved as an equal agent in the process of decision making and implementation.

During the 1971 Conference on Folk Culture, Richard Bauman presented his proposal for the establishment of a Center for Applied Folklore. Although pursued for a short period by a handful of devoted folklorists, such a center has

never materialized. There were, of course, those who stood in strong opposition to the very idea of applying folklore outside of the academic arena. Among those who stood in opposition was the late Richard M. Dorson, who believed strongly that the role of the folklorist was within the academic arena. Dorson advocated that research, publication, and teaching were the mainstays of the folklorist, and he further contended that scholarship suffered when extra activities outside of the academic environment pulled scholars away from their accepted duties. Dorson's views on applied folklore (and later, public-sector folklore), softened after he directed a research project among mill workers in Gary, Indiana, in the 1960s.

Just as there were definite possibilities for "cultural dynamite" inherent within the definition of applied folklore, so were there also inherent problems within Dorson's (and others') objections. Implicit within the thinking of those who opposed applied folklore was the belief that scholarship was for a chosen few and that the larger audiences comprised of the "general public" had no direct role in the applications of scholarship. Those who favored applied folklore did not stand in opposition to solid scholarship; they wished to place the results of their education and research into some practical use to foster positive action and change while testing the validity and soundness of theories from folkloristics.

During the next few years, the strivings of those persons involved in applied folklore were diffused through dichotomies that arose between the two camps of thought, and the very definition of applied folklore was softened. A new rhetoric arose that relegated the role of applied folklore to an exercise that took the folklorist from the activities of research, publication, and teaching into “activities” outside the academic arena. These “activities” were broadly defined, and absent was the stronger rhetoric pertaining to the active pursuit of social, economic, or political change.

Historically, there were earlier movements that embodied the strivings of the applied folklorist of the late 1960s to 1970s. When folk schools were first formed in the early 20th century, for example, their founders directly stated the desire to improve social, economic, and political conditions for their community members and constituents. The Highlander Folk School of Tennessee served as a training ground for Dr. Martin Luther King, Jr. and Sister Rosa Parks in their activities involving peaceful protest and civil disobedience. In the 1930s, the John C. Campbell Folk School of Brasstown, North Carolina, instituted woodcarving and cooperative farming activities (with training in new farming technologies) in a desire to empower the members of the community while increasing their economic status. Placed in the context of the original definition for applied folklore, these folk schools wished to institute a change in the lives of their constituents that would “ameliorate economic and technological problems.”

Into the 1990s, the things that the applied folklorists strove toward have been reached to some degree within public-sector folklore. Early in the movement of applied folklore, one of its defining characteristics was a desire to expand folklorists’ roles and responsibilities into venues outside of the academic arena. With the establishment of state, regional, and local folk-arts programs, the folk-arts program at the National Endowment for the Arts, the American Folklife Center at the Library of Congress, and the Festival of American Folklife as presented by the Smithsonian Institution, many folklorists are employed outside of university and college contexts. Most of these would define themselves as public-sector folklorists. In addition, there has been a related movement termed “cultural conservation,” which advocates much collaborative research, publication, and programming activities among persons employed within a diversity of public and private institutions. One may ask, however, if the persons who embody these positions strive to institute social change or solve perceived social inadequacies, in the original meanings of the applied-folklore movement. In addition, the same question must be asked about public-sector folklore as is posed above regarding the definition of applied folklore: Do the people or communities involved in the activities of the public-sector folklorist necessarily want or desire the increased visibility, empowerment, and attention that comes to them as the result of these public programs? Further, upon whose terms are these public programs and their related activities envisioned and implemented? The ethical and theoretical problems inherent within public-sector work (as an extension of applied folklore) are numerous.

Despite the visibility and attention given to public-sector folklore and cultural conservation, applied folklore in its original meanings and definitions continues to be carried forth. David Hufford, for example, actively utilizes folklore theory and techniques in his work within medicine and hospitals, with an objective toward implementing changes in certain structures and systems. The Highlander Folk School continues as a center for the study of environmental pollution, with very active protest activities

implemented to institute change. In 1985 folklorist Leslie Prosterman edited a special issue, entitled “Practicing Folklore,” for the journal *Practicing Anthropology*, a publication of the Society of Applied Anthropology. The issue was devoted to then current activities in applied folklore, illustrating its continued vitality. Thus, some of the goals that fueled the original proponents of applied folklore continue to motivate folklorists, sometimes couched in the current activities within the public sector and cultural conservation.

April Fools’ Day

The first day of April, an unofficial holiday observed in northern Europe and North America with pranks, innocent fibbing, and practical jokes. It is also known as All Fools’ Day and, in Scotland, as Huntigowk Day, from the custom of sending the gullible on “gowk-hunting” missions—the gowk, or cuckoo, being an emblem of simpletons (for other European antecedents, see Dundes 1989). In America, too, fools’ errands are traditional, with the unwary being sent for sky hooks or pigeon’s milk. Children delight in mildly aggressive mischief (salting the sugar bowl, placing “Kick me” signs on friends’ backs) and in various forms of creative deception, from gluing coins to the sidewalk to “Made you look” lies (“There’s a spider on your shoulder!”). Also perennial are telephone gags. A friend might be told, “Call this number and ask for Mr. Lion,” only to discover that he has reached the local zoo.

Adults, too, engage in subversive raillery. Hennig Cohen and Tristram Potter Coffin (1987) recount office pranks in which a fellow worker is told his girl friend is pregnant, and a scofflaw is “arrested” for parking violations. The day is a special boon for hoaxing journalists. The British media have run stories on Italy’s “spaghetti harvest” and on a marathon runner who, misreading the rules, intends to run nonstop for twenty-six days. College newspapers announce the firing of the faculty. The April 1, 1985, issue of *Esquire* magazine carried George Plimpton’s biography of ballplayer Sidd Finch, a Zen enthusiast with a 168-mile-per-hour fastball.

The day’s association with bootless errands has suggested many historical prototypes, including the flight of Noah’s dove, Jesus’ shuttling between judges at his trial, and Ceres’ search for the echo of Proserpine’s crying. The holiday has also been linked to the medieval Feast of Fools, the Hindu festival of Holi, and the unstable, “fooling” weather of early spring. The most probable origin, though, is calendrical. In 1582 France’s Julian calendar gave way officially to the Gregorian, shifting New Year’s Day from March 25 to January 1. But the official policy was slow to drive out habit. For years the conservative and the forgetful continued the custom of exchanging calls and gifts on April 1, the octave of the traditional New Year’s Day. Their error made them Europe’s first “April fools,” or *poissons d’avril* (from the belief that “April fish” are easily deceived).

Functionally, the mild mayhem of April Fools' Day is a vernacular form of "symbolic inversion" quite appropriate to the season of the vernal equinox. The day has been called a "calendrical rite of passage" that allows for a temporary "reversal of power" (Dundes 1989). Like other inversive holidays such as Halloween, it operates under an unwritten protocol that periodically tolerates the impermissible. Hence the impunity of the April 1 jokester. When he signals a joke with the formula "April Fool!" the recipient must respond nonaggressively. Folk wisdom claims that a loss of temper may ensure the victim "real" bad luck. That April fooling is a means for managing disorder is also evident in the custom, now defunct, of sending anonymous love letters, "all in fun," to those whom one was afraid to approach directly (Harder 1961).

Finally, computer users have their own April Fool practical jokes designed for them, such as the shareware program that alarms the user by announcing the presence of water in the hard drive, then turns your computer into a spin drier. Bogus announcements of April Fools' Day computer viruses have also occurred.

Architecture, Vernacular

Artifacts and landscapes built in communities according to time-tested but flexible customs and generally without the services of professional architects; also called “traditional architecture” and “folk architecture.” Like other features of folk tradition, vernacular architecture involves a swirl of inherited ideas and skills in contact with changing fashions and models from sources outside of the community’s shared aesthetic. This kind of building combines sensible habits with variations that meet the community’s expectations and ideals.

The much mythologized rural, small town, and “main street” America continues to be the focus of many studies in vernacular building. Typically, main street was built and rebuilt by generations of pioneers or early builders and then by entrepreneurs and businessmen who worked to establish a secure, prominent position for their community in the economy of the state, region, and nation. Many a town got its start as a small service community for commercial mining or timbering employees, farmers, or river tradesmen. The town may have further evolved with the coming of the railroad, a tourist and recreation enterprise, a new factory, or an interstate highway. The majority of historic buildings in any town or region are vernacular, or traditional, buildings. It is that kind of commonplace built environment that conserves the essence of a town’s special history. At the end of the 20th century, we are beginning to appreciate everyday architecture and to see the messages ordinary buildings convey. Understanding and conserving all kinds of buildings and places will be important if future citizens are to comprehend history accurately and in context.

For the past fifty years, new commercial architecture and reconstructions of downtown buildings have mosdy tried to imitate icons from other regions of the nation (witness the long-running Williamsburg, Virginia-derived “Colonial Revival” style). Projects have eradicated and thus denied the authentic traditions of cultural regions with distinctive folk traditions; when the threads of local personality are severed, the fragile connections of local heritage are lost.

Vernacular buildings usually (but not always) express patterns of ethnic and regional character. Vernacular architecture often has localized and regional patterns based on familiar traditions in design, construction, decoration, and use that have evolved over generations. It often, but rarely exclusively, employs local building materials. Scholars study these patterned resemblances through space and time, charting the tenacity of ideas as well as the dynamics and changes that always occur in cultural heritage. Researchers have sorted the many varieties of vernacular buildings into *types*. This typology, or placing building types into categories based *on form*, demonstrates their genealogies and helps illustrate their formal evolution through time, sometimes through centuries of use and movement. Form (floor plan, layout, height) is important in traditional building because form is relatively stable over time and space, and scholars can use form to devise categories and assist in investigations of cultural diffusion.

Type differs from *style* in architecture. Type is an important element in the study of vernacular architecture. A building's type—floor plan, placement of chimney or stove, roof form, height—is very stable over time. Distinct patterns of vernacular buildings can be charted and mapped through time and space, and we are sometimes able to detect the probable origin for types of buildings we had previously thought to simply be “American.” Matters of construction, use, and decoration of vernacular buildings are also very important and are the subject of scholarly research and interpretation.

Most stores, roads, houses, bridges, barns, warehouses, gas stations, and so on are the result of the dynamics and processes of vernacular design in the place where they were imagined and constructed for the needs of routine life, work, and commerce. When people have choices, they select types and styles in dwellings that reflect a number of forces. Choices may be made to present an impression to the neighborhood, to express well-being and success and participation in the fashion trends of the day.

Among the best-known types of American vernacular houses are British Isles-based types such as the single-cell (or “single pen”) house, varieties of double-pen houses (such as the hall and parlor and the saddlebag subtypes), the I house, the Georgian cottage and house, and the foursquare house of the Midwest, along with the French Creole house, the *Ern-haus*, or “hall-kitchen” house, built by German-speaking immigrants, and the shotgun house. All but the shotgun house are based on postmedieval European spatial traditions; the shotgun house, a long narrow one-story house with its door or front in the gable that faces the street, has its origins in West African communities and in a sequence of evolution that took place in the Caribbean and the Mississippi River Basin around New Orleans. There are a dozen or so major barn types in America, among them the English barn type familiar in the East and the transverse-crib barn type, a widely distributed Midwest and Southern type typical of the 19th century. These house and barn types were erected in all manner of traditional construction materials, from adobe and sod to brick and stone, and in the various forms of horizontal and vertical log and wooden frame construction.

Sharecroppers' house. Asheville, North Carolina, late 1800s or early 1900s. Library of Congress.

In the context of vernacular architecture, style pertains to visual elements of decoration and ornament that buildings exhibit. One can place buildings in a category of style by studying these surface qualities. In vernacular architecture, style has little to do with a building's functions or its use of interior space. Stylistic periods change through time as fashions change in the context of popular design and taste, often as influenced by a small number of designers, artists, or architects whose ideas are widely disseminated in the media. One of the problems with classifications of styles and periods is that the categories are fuzzy and easily abused. For example, "Classical" applies equally to an 18th-century English brick house in the Virginia tidewater, a New England church facade, and a suburban shopping mall storefront in Los Angeles.

Vernacular buildings may also display flashes of the style and ornaments of the age, such as "Georgian," "Greek Revival," "Gothic," "Mission Revival," or "Colonial Revival." These broadly popular styles reflect national changes in taste. Stylistic ornament is characteristically applied as a sort of mask or Sunday clothes, put on the form of an otherwise ultraconservative vernacular house. The special architectural style that dresses up a vernacular building is a vital element in the building's social and cultural context.

Symbols are important. For example, we have inherited a deep-seated concept that Greek- and Roman-looking classical columns lend dignity if not a look of success and power to the front of a 19th-century farmhouse or the entry on a new suburban banking facility. Americans love grand columns and Classical pediments, whether realized in

massive limestone on the county courthouse or made of flat vinyl and nailed as a decorative motif up and around the porch of a ranch-style house.

Students of vernacular architecture concoct long lists of questions to ask about the subject. In addition to the questions inherent in the remarks above, two more may be mentioned: Why do things last after their supposed original function changes or ends? Are they survivals from earlier periods or other places? Take, for example, the large fireplace in the new suburban house. Its original function gone (cooking hearth and heating), the fireplace continues to be built because a hearth has symbolic values for millions of people—and offers the correct place for some American families' ritual hanging of the Christmas stockings.

Studying vernacular architecture gives us entry into broader areas of behavior and cultural expression. People live in environments, whether haphazard ones or planned, and not merely in buildings. We build these environments, and their relationships with other environments are important. Vernacular buildings often reflect an intention to conform to accepted values in the community, resulting from hallowed (and some-

times moribund) traditions in design rather than from fashionable or futuristic academic architects. Folk builders naturally and often reuse parts of old structures or entire

structures as they expand and tinker with their landscapes and people take advantage of local climate and terrain. To be conservative is not necessarily to be old-fashioned or resistant to change.

Traditional builders acquire competence through apprenticeship and imitation of admired models and artisans rather than through institutionalized classes or schools of design. Design values are imbedded in the community's traditions and worldview. Rather than being called an "architect," the designer of a country store, a gas station, a Philadelphia row house, a railroad-crossing shack, or a coal-mine tippie was likely to be called a builder, a contractor, a craftsman, a bricklayer, a carpenter, a stone mason, or another such term.

One of the features of vernacular design that differentiates it from high-style design is the degree to which the client and other members of the community participate in the architectural process. Forms are often familiar; neighbors understand what is being built and why. The contractor knows similar buildings, and his work is attuned to the needs of the client. This sometimes means there is less room for creativity in the job than in high-style design, but that is expected in the processes of traditional building. People apply decorative details and variations to give the building special character.

Vernacular buildings range from the prehistoric Native American dwellings of natural materials to the vertical-log walled houses of French settlers in the Mississippi Valley and the vast barns of the Pennsylvania farm; from the fine Georgian and Federal I houses of early times to the split-foyer suburban house of the 1970s and 1980s. Vernacular building is well represented in structures that may seem to be high-style but exhibit strong elements of local and ethnic cultural heritage, such as the Victorian town house, the community school building, the mail-order-catalog bungalow, and the county courthouse.

We can help guide changes in our built environments through planning, zoning, efforts in historic preservation, and cultural conservation. We may, in fact, select buildings, artifacts, and memories that we deem important in a community's heritage. The remembered story of how the electric company forced people off the fertile river bottomland to build the hydroelectric project or the flood-control reservoir, or the chair made by the itinerant carpenter, or the log house that once served as a stagecoach stop—these memories and artifacts become heirlooms of value. Thus it is that scholars of traditional building look at architecture, landscape, and landmarks as palpable, tangible manifestations of culture, both high-style and vernacular. For vernacular design, one of the best ways to study culture is by direct examination and analysis of the built environment, because material things are stable and expressive vessels for communication of ideas. We need to look at structures that embody the citizens' sense of place and of history in both conscious ways (statues in the cemetery, public-school design, churches) and unconscious ways (farmstead buildings need to help manage and direct the forces of progress if they are to help leave a usable history to those who layout, vernacular houses' symmetry). People who study follow.

Archive of Folk Culture

The archival arm of the American Folklife Center. The Archive of Folk Culture was founded in 1928 within the Music Division of the Library of Congress. Originally named the Archive of American Folk-Song, it represented an early institutional commitment to documentation and research in the area of the American folksong. Its first head was Robert Winslow Gordon, and during the 1930s it flourished under the direction of John and Alan Lomax, building a large collection of field recordings and manuscripts from all regions of America and becoming a national center for documentation of American folk traditions. Later heads included Benjamin A.Botkin, Duncan Emrich, Rae Korson, Alan Jabbour, and Joseph C.Hickerson. In 1978 the archive became part of the American Folklife Center, and in 1980 it was renamed the Archive of Folk Culture to reflect the makeup of its ethnographic collections.

In 1941 the first of a long-lived series of albums appeared from the archive's collections, presenting documentary recordings of folk music and folklore. The series pioneered in using sound recordings to present folk culture to a broad audience, and commercial companies producing documentary recordings in later decades owe much to the archive's early published series. The archive was also the basis for creation of the library's Recording Laboratory in 1941, and during the same period Alan Lomax experimented with field documentaries and hosted programs on radio.

Collecting concentrated on American folk music in the archive's early years, but Alan Lomax took a step toward making the collections international by visiting the Bahamas in 1935 and Haiti in 1937. His documentary work also led to experiments with artistic

biography in sound, involving verbal interviews as well as musical performances of artists such as Aunt Molly Jackson, Huddie Ledbetter (Lead Belly), Woodrow Wilson “Woody” Guthrie, and Ferdinand “Jelly Roll” Morton. By the later 1930s, the office helped launch the term and concept “oral history.” In the 1940s, under Botkin and more strongly under Emrich, the emphasis on verbal and other traditions grew, and for a period in the 1950s the unit was renamed the Folklore Section. Korson strengthened the archive’s ties to ethnomusicology, and during her tenure the worldwide holdings were strengthened.

Under the aegis of the American Folklife Center, the archive collections have been significantly increased by ethnographic field projects. These collections include every medium of documentation and cover the full subject-matter gamut of folklore and folklife. In 1994 the archive held more than one million items, including 600,000 manuscripts, 200,000 color and black-and-white still photographs, 50,000 sound recordings, 200,000 ephemera, and lesser numbers of moving-image documentation, computer discs, and other media. Roughly three-fourths of the collections are from the United States, including materials from every state. The international and older domestic collections are primarily musical, whereas ethnographic collections from Folklife Center projects are strong in material and verbal culture and in occupational and ethnic traditions from both rural and urban areas. U.S. collections range from American Indian materials to documentation of the most recent immigrant traditions.

Archives, Folklore

Depositories of collected folklore materials, including tapes, transcripts, photos, films, material-culture items, and so forth. Folklore-archive materials reflect different folklore genres as they are practiced among different peoples and in different geographic areas. Folklore archives have existed in Europe since the 1800s; however, not until 1928 was the Archive of Folk Culture founded in the United States. Housed in the Library of Congress, the Archive of Folk Culture benefited from Works Progress Administration (WPA) projects, in the 1930s and 1940s, and more recently has sponsored folk studies in various areas of the nation. Though technically a national archive, the Archive of Folk Culture does not function as comprehensively as its European counterparts. As a result, a folklore scholar in the United States needs to be familiar with smaller archives throughout the country.

While there are archives affiliated with state folk-arts councils, the majority of folklore archives in the United States are connected to universities. Often starting in boxes that eventually take over the office of a folklore professor, archives need their own space to be effectual. Such archives rapidly expand, composed primarily of materials submitted by students to fulfill class requirements, as well as items collected by professional folklorists. Collecting leads logically to archiving, which in turn fosters research.

Students visiting folklore archives are able to see how their collections are used by other students and scholars. However, archivists generally do not allow students unlimited access to an archive. A folklore archivist secures archive materials so that no precious information is lost. Some archives have material that is restricted, and limitations are often put upon documents folklorists use for personal research. In addition, the informant and the collector may also place restraints on material. Despite such restrictions, a well-organized and extensive archive will contain a wealth of easily procurable material.

Maintaining an archive is a never-ending process. A folklore archive needs to have folklore material readily available in order to be useful for scholarly research by both the student and the folklore professional. Ideally, folklore archives should be used by scholars of varying disciplines, creating camaraderie rather than competition. The magnitude of material submitted to an archive requires organization by diligent archivists to see that items are available and that the archive runs smoothly.

Well-organized submissions and careful use of archive materials are essential in developing a well-run archive. However, no matter how well organized or well supported an archive is, its success hinges, ironically, upon both the flexibility and the consistency of methods employed by the archivists.

The first step in building an archive is to gather a large enough body of material to warrant a collection and from which to be able to draw valid conclusions. Some archives contain private collections of one person's life research. Other archives, such as those in the public sector, contain material collected from the community, while archives at universities and colleges often contain items collected by students.

One of the most critical tasks in establishing and maintaining an archive is that of preservation. The archivist must be aware of the types of paper used, the boxes in which they are stored, the manner of storing recorded tapes, and the temperature and humidity of the archive, among other things. If an archive has hundreds of narratives about the fishing community in a given area, but stores copies on low-quality paper, that collection may be useless within twenty years because the printing may begin to fade or the paper to crumble.

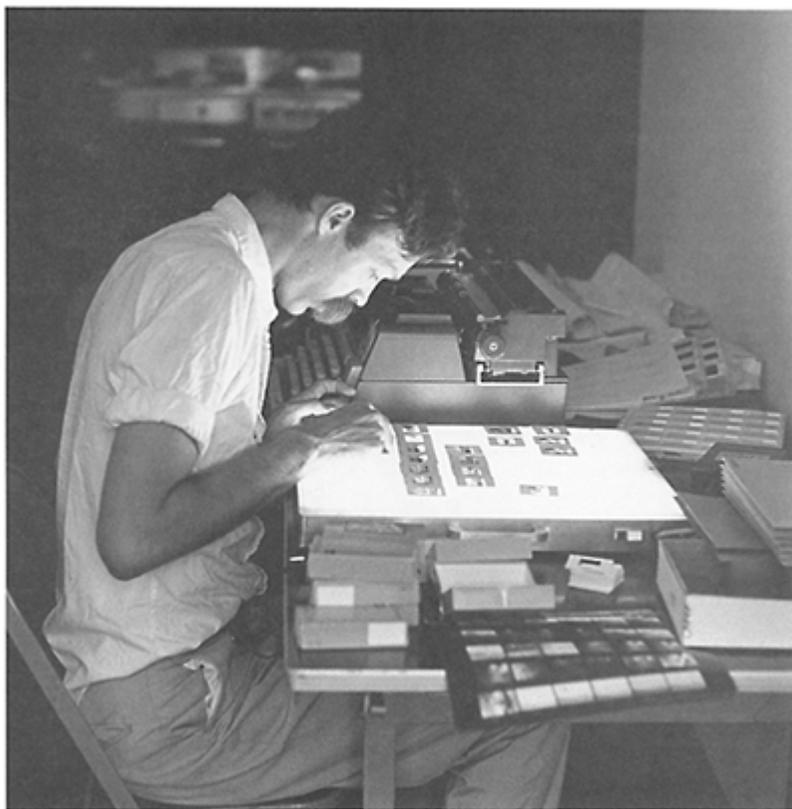

Once the material in the archives is in good condition and ready to be filed, a system must be established so that patrons and employees can easily access this material. The best possible system depends on the nature of the collections and on the needs of the users. One traditional method of narrative classification is represented by the Aarne-Thompson Type Index and the Thompson Motif-Index. Another way to classify material, not limited to narrative, is described in William A. Wilson's 1993 article, "Mormon Folklore: Cut from the Marrow of Everyday Experience." There is no one technique perfect for every archive, and types of indexes vary from one archive to the next.

Until recently, most archives compiled their indexing systems on a series of index cards, similar to a card catalog in a library. As computers have become more popular and more readily available, archives across the country have begun to index their material on computer.

With a system of indexing in place, the archivist must evaluate the collection and determine the best placement of each item. This step is one of the most time-consuming and often most frustrating for the archivist. Most items slide easily into the niches devised for them, but there are many that resist classification. This is why the archivist is forced to keep constantly informed of current scholarship and genre classification issues. As time passes, genres are interpreted and perceived differently, and adjustments are made to definitions.

At all times, the archivist must keep in mind that the archive is only valuable if a researcher can easily access the material. Patrons of a folklore archive can maximize their research time by having a specific topic in mind, with key words and phrases that will help the archivist locate the needed material. The more information provided the archivist, the more he or she will be able to help in research. Flexibility is also important because folklore is not always classified as one might expect.

Those collecting material that will eventually be archived should contact the particular archive intended as the recipient in order to find out what format to use and what contextual information to include. In this way, archive contributions will be more valuable. There are several ways to find an archive in a specific area. Art, Folk

Objects of aesthetic expression usually appreciated for their traditional aspects. Most artworks identified as folk come from traditional cultures and are learned in a nonacademic face-to-face interchange. While folk art often seems to be synonymous with ethnic art (Hmong storycloths, Amish quilts, or Mexican American death carts), it also comes from traditional communities held together by ties related to occupation, region, religion, generation, politics, economics, or family. While there is a continuing debate over precisely how to define folk art, generally speaking, most scholars agree that the boundaries for art categories such as folk, fine, tourist, ethnic, or popular are fluid.

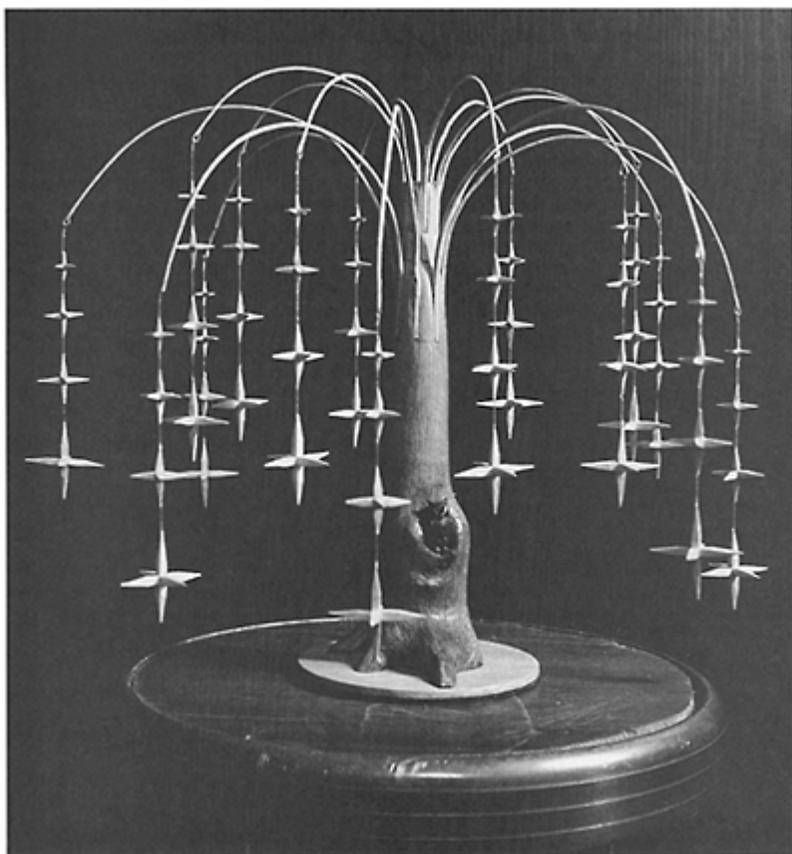

Since the beginning of the 20th century, folk-art study in the United States has been influenced by antique collecting, European class structures, museum practices, modernist perspectives of fine art, and varying approaches to the study of all art within different academic disciplines. In the United States, folk art's "beginnings" (which ignored the work of Native Americans, classifying it as "primitive") were first identified with new immigrants who continued their European traditions. These new citizens often settled in communities with others from their country of origin. While there was sharing among varying cultural groups, thereby somewhat changing the weaving, the basket, the carving, or the pottery, many traditional practices of ritualistic use or content remained.

Originally, the creator of folk art was usually seen as a rural, nonliterate, poor, and isolated individual. This approach probably grew out of the European way of identifying folk artists as peasants. Holger Cahill, who was influential in folk art's early study, believed that the great period of American folk art covered the second quarter of the 17th century up to the third quarter of the 19th century.

It was not until the early part of the 20th century that American folk art gained recognition outside of the community of origin. The first "discovery" came from members of the group we call fine artists. Artists such as Peggy Bacon, Alexander Brook, Charles Demuth, Yasya Kuniyoshi, Robert

Laurent, Elie Nadelman, and William Zorach appreciated both the immediacy and the directness of the work as well as the kinds of materials that were used, often wood and iron. Besides these artists, early collectors included the Rockefellers, the Kaplans, and the Lipmans. Little attention was paid to documentation of the artists or their contexts, thereby encouraging the idea of folk art as anonymous. Edith Halpert and Cahill are credited with initiating widespread public acceptance of folk art and the collecting of it as “proper” artistic expression. By “proper,” they meant that they viewed folk art as objects with aesthetic value based on formalist approaches, rather than objects coming from traditional communities that functioned in ritualistic or utilitarian ways.

In the 1920s, artists and collectors would flock to rural Maine in the summer to gather paintings, carvings, weather vanes, gravestones, and ship and architectural carvings.

Americans were interested in having a separate identity from Europe, and they believed that folk art would help us understand our own cultural heritage. In addition, as the United States became more industrial, many citizens wanted to keep the past alive. They theorized that if the folk arts continued to thrive, important elements of the past would continue. The notion prevailed that the best folk art was that which was old.

For many years, *Art in America* and *Antiques* were the only periodicals that would publish articles on folk art. Because collector Jean Lipman was the editor of *Art in America* from 1940 to 1971, articles about folk art were encouraged. Alice Winchester, another early-20th-century collector, was the editor of *Antiques* for many years. This magazine was largely responsible for stimulating and maintaining an interest in folk art (viewed as closely aligned with antiques) during that time. In 1950, an issue of *Antiques* was published that solicited definitions for the term “folk art” from people who had either written about it, collected it, or exhibited it. Most of the writers were “art-” oriented people (as opposed to folklore-, history-, or anthropology-oriented people), and they described folk art from the object point of view (as opposed to a context perspective). However, even among these writers, there did not seem to be much of a common focus.

The first widely acclaimed collection of American folk art was begun in the 1920s by Abby Aldrich Rockefeller with the help of Edith Halpert, who was then the director of the Downtown Gallery in New York. This collection is housed at the Abby Aldrich Rockefeller Folk Art Center in Williamsburg, Virginia. Electra Havemeyer’s collection began as early as 1910 when she married J. Watson Webb. In 1947, the Webbs founded the Shelburne Museum in Shelburne, Vermont. During this period, Eleanor and Mabel van Alstyne also developed a strong collection, which they gave to the Smithsonian Institution in 1964. Jean Lipman’s collection was bought by Stephen C. Clark in 1950 for the New York Historical Association in Cooperstown, and Henry F. du Pont made his home into the Henry Francis du Pont Winterthur Museum in Winterthur, Delaware. His house is full of many folk-art masterpieces. Henry Ford’s extensive collection is in the Henry Ford Museum in Dearborn, Michigan, which also includes some folk art. More recently, Herbert Hemphill gave his extensive collection to the Smithsonian, and Michael and Julie Hall made a gift of their folk art to the Milwaukee Art Center in Wisconsin.

The first public folk-art exhibition, organized by Gertrude Vanderbilt Whitney, was in 1924 at the Whitney Studio Club in New York City. Since then, the momentum and interest in exhibiting folk art have been building. In 1932 the Museum of Modern Art in New York City exhibited a show called *American Folk Art: The Art of the Common Man in America, 1750–1900*. Included were oil paintings on glass, cookie molds, wood and metal sculptures, plaster ornaments, ships’ figureheads, toys, carved wooden cigar-store Indians, weather vanes, decoys, metal stove plates and figures, and ornamental eagles and roosters. The majority of works in this show and other early ones were from New England. The idea of folk art as art by the common, everyday person persevered. Because of the enthusiasm for these kinds of objects by antique collectors, many handmade objects that had been called “antique” were now being called “folk.”

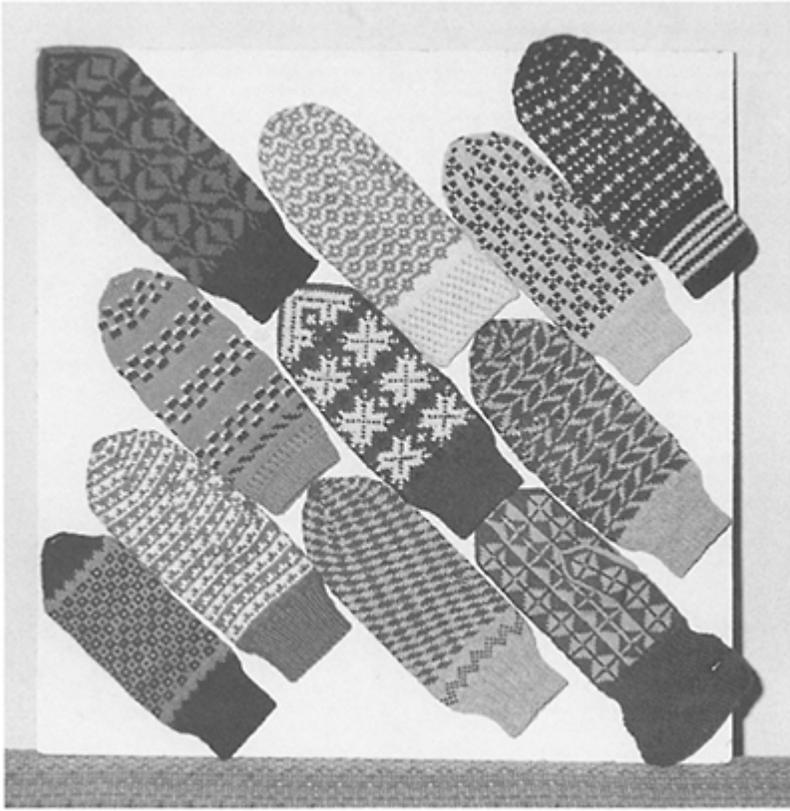

The Depression years brought about the Works Progress Administration (WPA). This federal program funded not only the collection of ballads and other oral folklore, but also an assemblage of art objects from rural areas. It also helped create hundreds of day and evening art classes at schools and community groups across the country. Art was seen as

important and necessary, and for people everywhere, including folk artists, the sense that art was a worthwhile activity was promoted.

The *Index of American Design* is one of the most comprehensive documentations of 18th- and 19th-century arts and crafts. It was one of many projects initiated in the spirit of

Franklin D.Roosevelt with the expressed intent of giving the nation a sense of wholeness and the “common” people a sense of pride and worthiness during troubled times. This book was edited in 1950 by Erwin O.Christensen, and it recorded 22,000 art representations, many of them considered folk art.

In the 1950s and 1960s, researchers began to look to the South and West as the idea of what could be considered folk art expanded. In 1970, Herbert Hemphill organized the exhibition *Twentieth-Century Folk Art and Artists* at the Museum of American Folk Art in New York City. This show was notable because it appeared to be the first time 20th-century American folk art (beyond the realm of painting) had been so broadly explored by a major institution. Folk art began to lose some of its close identity with antiques. This exhibit included wood carving, *santos* of the New Mexican religious tradition, neon road signs, toys, decoys, fabric and needlework pieces, assemblage pieces, and photographs showing examples of fantasy gardens and environments, storefront art, graveyard art, and

scarecrows. It made folk art appear abundant and important in 20th-century America. Additionally, folk art appeared to be alive and well all over the country.

In 1974 another major show, curated by Alice Winchester, took place at the Whitney Museum of American Art in New York City. It was called *The Flowering of American Folk Art, 1776–1876*, and it is credited by some as the first exhibition to survey “the entire range of folk art,” which is and was, of course, an impossible task. It is interesting to note that the popular magazine *Art News* critiqued the catalog book, written by Jean Lipman, as disturbingly having more focus on biography than stylistic analysis. The art object, clearly, was being more connected to the artist, and the idea of folk art as anonymous art was fading.

In the 1970s, as state and regional arts councils flourished, geographical regions began to research and curate shows. These shows were usually coordinated by folklorists, trained to see folk art as a traditional process rather than as an isolated object to be viewed against a white wall and appreciated for its formalistic design elements. The cultural community in which an artist lived and worked was determined to be important to the understanding and appreciation of the artistic process and, in turn, the way the product was understood and appreciated. The *Early Art in the Genesee Valley* exhibit in 1974 concentrated on one region in New York state. It was set up to reveal “the social function of arts during the eighteenth and nineteenth centuries in the Genesee Valley by the display of artifacts locally manufactured or locally owned.” This show emphasized that the objects exhibited were to return to people and houses instead of museums. In other words, the objects functioned within the daily lives of individuals and communities, and, therefore, their return was viewed as important.

The 1978 Michigan Folk Art Show, organized by C.Kurt Dewhurst and Marsha MacDowell at Michigan State University, identified folk artists in four different ways that incorporated both conservative definitions focusing on tradition and community belonging, and individual expression and the influence of technology. This approach was an attempt to incorporate a broad enough definition to include both the traditional and the vernacular artist. However, in general, subsequent folk-art shows coordinated by folklorists holding positions as state folk-arts coordinators, attempted to define folk art as more traditionally bound. Additionally, they made attempts to portray the meanings and functions of the objects in people’s lives. Good examples of these types of exhibitions were those held in 1980 in Oregon (coordinated by Suzie Jones) and in Utah (by Hal Cannon).

Within the last few decades, folk-art publications and exhibitions have come from two major directions. Generally speaking, museums utilize the art-historical approach, which has traditionally looked at the folk-art object from an aesthetic perspective. When folklorists are involved with the research and display, the exhibit direction becomes more contextual. Also, some curators and art historians lean toward a folkloric approach to folk art. Probably the three most active museums in exhibiting and publishing works on folk art have been the Museum of American Folk Art in New York City, the Winterthur Museum in Delaware, and the Abby Aldrich Rockefeller Museum in Williamsburg, Virginia.

Most of the fifty states have folk-art coordinators, who have not only surveyed their regions for folk art and exhibited the works, but also often coordinate folk festivals in an effort to educate the public on the relationship among the artist, the object, and the artist’s

community. Publications resulting from these programs emphasize the cultural community, the ways the object is used and appreciated, and the values and beliefs that are communicated. Folk-arts coordinators have also been active in developing folk arts in education programs, in which folk artists are employed to teach about local traditions. These programs, like many folk-art projects, are often funded by the Folk Arts Division of the National Endowment for the Arts. Apprenticeship awards, folklore fieldwork, and other folkloric activities are also often supported by this federal agency.

As the 20th century comes to an end, avenues for communication have increased, and competition over the study of folk art has blossomed, but there remains a lack of consensus on the definition of folk art. Over the last one hundred years, many words and phrases have been used to define folk art, many of which are demeaning, classist, racist, colonialist, and just plain narrow-minded. Among the terms used are: simplistic, provincial, childlike, a dying art form, copied, antique, nonacademic, unsophisticated, naive, primitive, untrained, unprofessional, handiwork, utilitarian, art by isolates, outsider, grass-roots, and peasant art.

In 1977 the Henry Francis du Pont Winterthur Museum held a conference on American folk art with Scott Swank as chair. It was an attempt to have scholars from different areas (university professors, museum directors, collectors, and specialists in folklore and material culture) analyze traditional views on folk art and look for new ones. At the same time, there was a folk-art show on display at the Brandywine River Museum. The show was developed in conjunction with the Winterthur Museum and expressed some of the new directions its curators wished to pursue with folk art. The new (and old) perspectives, which were discussed at the conference and at the exhibit, stirred controversy among attendees. The result was perhaps more confusion, less consensus, and increased alienation among groups interested in the study of folk art. The 1980 anthology *Perspectives on American Folk Art*, edited by Ian M.G. Quimby and Swank, was a result of these events.

Since the early 1970s, folklorists have become increasingly interested in folk art. Early folklore scholars who led the way include Louis Jones from Cooperstown, New York; Michael Owen Jones (1989), who did an early extensive study on a chairmaker in the Kentucky mountains; Henry Glassie, who studies vernacular architecture; and John Michael Vlach, who continues to do studies in African American folk art and material culture. While anthropologists have studied folk art in far-off places, they have, generally speaking, neglected folk art study in the United States. Because of anthropology's absence in American folk-art study, folklore's late entry, and museum collectors' earlier hold on the approach to folk art, there remain conflict in defining folk art, political turf guarding of funding sources, and general disagreement over what objects to study as folk and how to study them.

In many respects, it is the folkloric approach to the study of art that permits an emphasis to be placed on the holistic creative process. Whereas a fine-art perspective usually entails a product-boundaried approach in its categorization, a folklorist will study many aspects of the creative process, often focusing on that which is traditional. One of the most often identified areas of tradition a folklorist will emphasize in defining a work as "folk" is how the tradition is learned. The tradition, then, is identified in the process of passing on certain community values and beliefs from one generation to another during the learning process. Examples would be Leon "Peck" Clark, a Mississippi basket maker

who learned to weave from a community member; George Lopez of Cordova, New Mexico, a sixth-generation *santos* carver whose children also carve; or the African American families from Mt. Pleasant, South Carolina, who weave baskets in similar ways to their African ancestors. Folklorists say that folk art cannot be learned in academic settings; it is the informality of the process and the community-based values passed on that makes the work “folk.” This process of defining folk art becomes problematic when one begins looking at more formal apprenticeship programs such as those in which the traditional boatbuilder in Mississippi is taught. While the boats and the artists are said to be traditional, the learning mode has been formalized. Or, in the case of orthodontists trained at the University of Washington to learn soldering skills by making art, when many of these students graduate they continue to make soldered sculptures, often informally sharing them with their former fellow students and other local orthodontists.

Some folklorists like to emphasize the tradition that exists in the creative process. For example, one Canadian Northwest Coast Indian carver learns his craft from his father by working on his own totem pole, imitating each move he sees his father make. As a result, the two poles are basically identical. Michael Owen Jones recognizes that more often the ideas, techniques, and skills that are passed on from one individual to another incorporate some change. However, there is a tendency toward conformity in these procedures. In fact, most folklore scholars agree that new tools and updated technology might also be used in the re-creation of a folk piece. For example, if an Oregon logger who learned traditional carving techniques from other loggers decided to switch to a chain saw, the artwork and creative process would still be considered “folk.” On the other hand, one must recognize that artists who are academically trained also employ certain traditional techniques and skills they learn in the classroom. These skills may have to do with the way to wedge clay or how to pull a pot from the potter’s wheel, but traditional creative processes are certainly passed on.

The most product-oriented way of looking at folk art is to find tradition in the content of the object. In other words, a carved piece of scrimshaw made by a Newfoundland fisherman should have on it a traditional motif in order for the work to be considered “folk.” Folk-art totem poles are made with traditional images of whales, ravens, or bears, and quilts are created from traditional patterns passed down from mother to daughter. However, in fine art, there is also tradition in the content of art objects. For example, in European paintings, the still-life bowl of fruit is ubiquitous, as is the reclining female nude. Many artists make a series of similar works that explore one topic or idea. For example, Alberto Giacometti spent many years making the same thin, standing figures over and over again.

Some scholars look to the style of an art object for traditional aspects. Certainly there is no one style that can be used to identify all folk art. However, there are stylistic traditions within folk-art expressions. Among storycloths are often embroidered on a blue background with bright colors reflecting similar scenes of villages and animals. Loggers carve similar kinds of chains and fans, and Pueblo potters utilize traditional clays, surface design elements, and firing practices to produce pottery recognizable to their region. In like fashion, fine artists, too, are grouped with those who share similar ideas about style. The Impressionists have stylistic similarities as do the Cubists, the Expressionists, and the Futurists.

Many folk-art survey books organize themselves around the form of the object. There are chapters on quilts, wood carvings, scrimshaw, weather vanes, gravestones, or circus figures. This also poses problems in differentiating folk-art classification systems since fine-art and popular-art books might also be organized in the same manner. In other words, there is nothing exclusive about the form of a quilt that makes it automatically folk art. Clearly, today many quilts are made that are categorized as fine art for a variety of reasons. Additionally, many artists today use traditional practices and re-create them in innovative ways. Such is the process of New York artist Miriam Schapiro.

Folklorists often look for tradition in the context of an object to determine if it is folk art. The question is raised, is dulcimer making “folk” when carried out in the Ozarks, but not when done in California? Does the tradition somehow exist in the human and physical environment as an extension of the individual? The difficulty lies in determining whether or not a certain set of values, attitudes, and beliefs is a part of the artist’s context. But as folk art is continually changing, how much change is acceptable within its boundaries is not easily stated. Potters in the Central and Western states learned new skills and techniques from ceramicists who, traveling west from the southeastern states, brought with them a unique alkaline form of glazing, wheel-turned handles, and the groundhog kiln; decoys were made by White settlers who imitated the Indians’ bird lures; and quilt patterns have been shared among diverse groups of women, although the names are often changed to fit specific local beliefs.

When folklorists study folk art, they inevitably look to how it is used within its context. Some scholars theorize that folk art is often so ingrained in the lives of everyday people that it is not differentiated from other activities, thereby defusing any need to refer to it as art. New England samplers were commonplace between 1620 and 1860; quilts, in many communities, were often made for every room of the house; and weaving rooms were part of every plantation until 1785. Likewise, Native American baskets were (and on some reservations still are) made for hauling loads, storage, winnowing, sifting, and even housing rattlesnakes. However, this definitional approach is problematic because popular forms such as comics, television, and movies, and fine-art forms such as park sculptures and elite architecture, also have their place in our everyday lives. Another way this issue has been approached is to say that much folk art is utilitarian. However, as Ruth Bunzel has pointed out, many traditional cultures also make art simply to gratify the aesthetic impulse. One example is the bone and ivory carvings of the Eskimos. Another categorization problem is that often the traditional artist makes a decision to create for the collector. When carver Lem Ward from Crisfield, Maryland, makes a decoy that ends up on a collector’s shelf somewhere outside Ward’s community, is it no longer folk art?

Some folklorists suggest that tradition resides not so much in the object itself as in the extension of the premises and assumptions that are shared and transmitted over time and space within a small community of people. However, it is clear that elite artists in many ways share common jargon, values, aesthetics, and folk tales. As much as fine artists are often viewed as isolates, studies like Howard Becker’s *Art Worlds* (1982) clearly demonstrate the collaborative process of all artwork. Nonetheless, as Jones (1987) points out, the idea of “the folk” is misleading. When we discuss aesthetics, we realize that one person’s values will not necessarily agree with another’s, because we all belong to several folk groups at one time. The importance of tradition in the appreciation process should not be dismissed, however, just because of the difficulties in understanding it. As

with the other aspects of folk art discussed, although problems exist definitionally, the manner in which the object is appreciated and the community accepts it are primary aspects in understanding folk art. For many folk artists, to have an identity and acceptance with the rest of the folk group is important. If an artist is seen as a renegade, his or her art begins to be viewed in the category of fine art.

Besides the importance of tradition, there are several other factors that go into defining a work of art as "folk": folk art is intended to be used in everyday life among members of a small, close group; it functions as a remembrance of the past or as a demonstration of respect for elders; it is made by persons who do not call themselves artists as readily as creators from other art groups do; and the artist and/or group members use a different language structure from the art school- or university-trained artist to talk about their work.

Asch, Moses (1905–1986)

Founder and director of Folkways Records, the prototype of small, independent folk-music record companies. Asch was born in Warsaw, Poland, to a family of Jewish writers, scholars, and revolutionaries; his father was Sholem Asch, the most widely read Yiddish author in the years between the World Wars. From him Asch acquired a profound sense of the importance of artistic independence. Asch was first schooled outside Paris, and then in the New York City public schools after the family immigrated to the United States in 1915. Although he never finished high school, he spent two years in a German *hochschule* studying electronics and radio technology. Upon returning to New York in 1925 he worked in the radio business, later establishing his own company, Radio Laboratories, and branching into the field of public address systems before entering the commercial recording market in 1941.

Asch's first records were of Jewish liturgical music (cantorials) for his "Asch" label. He initially ventured beyond the Jewish field by recording the African American singer Huddie Ledbetter (Lead Belly) in 1941. Although he found financial success recording jazz artists during World War II (and until the bankruptcy of his second recording company, Disc, in 1947), it was also during the war that he began recording those singers and instrumentalists who became the pantheon of American folk music, including Woody Guthrie, Cisco Houston, Pete Seeger, Sonny Terry, and Josh White.

Asch established Folkways Records and Service in 1948 with his secretary, Marion Distler, and ran it until his death in 1986. While often imperious, he was also revered by many because of his insistence upon principles of artistic, cultural, and historical worth that were often at odds with the commercial constraints of the record business.

Auctions

Method of selling in which the price or value of merchandise is set by the buyer through a competitive bidding process. The bidding may be accomplished through written, oral, or gestural responses to offers, and most often follows an ascending price pattern. The auction process provides an efficient vehicle for the redistribution of large quantities of varied merchandise and for setting a market value on items of unknown or variable value. Most auctions are led by an auctioneer, who functions as the intermediary between buyer and seller and who generally plays a large role in organizing and conducting the sale. Except in the case of some charity auctions, auctioneers conducting sales are trained, licensed professionals.

The auction process involves a wide variety of merchandise and situations: real estate, personal property, full estates including both real and personal property, livestock, automobiles, and fish and produce (from fresh-cut flowers to tobacco). Those auctions serving a wholesale market, where goods are purchased for resale, generally attract professional or semiprofessional buyers. Folklorists most often study community-based auctions that involve the general public: estate sales, local livestock sales, and sale barns or auctions held on a regular basis at a fixed location where individuals bring lots of merchandise to be sold by the auctioneer. Such sales offer particularly fertile ground for folkloristic inquiry, in part because the social process and the economic process are so closely intertwined.

One initial task in the investigation of any auction is to identify, through the collection of quantifiable data, the actual demographics of the community present at the sale. The distance a participant traveled to attend the sale; the relationship among participants, the auctioneer, and the owner of the merchandise; the methods through which a participant learned of a sale; and the participant's reasons for attending a sale—these are some of the factors that help describe the social dynamics of this economic process.

Folkloristic inquiry identifies a number of areas in which the interaction of auction participants creates and maintains traditions that further define the economic process of buying and selling. The ways in which goods are exhibited for sale, the order in which items are sold, the kinds of goods that are not sold (for example, some auctioneers will not sell a Bible at auction) and whether that decision is based on personal preference or state law, the operation of food concessions (who sells what and why) at a sale, and the manner in which a sale is advertised to the public are all factors frequently determined by community-based tradition and precedent.

The verbal artistry of the auction process—perhaps the most easily recognized, most familiar, and most investigated aspect of the auction sale—is also shaped by community-based tradition. Though most auctioneers attend training schools where they receive some instruction in crying or chanting a sale, skillful auctioneers perfect this art through the lengthy traditional process of observation and imitation—through working with, and around, other successful auctioneers. The smooth patter combines the repetition of a current bid with the request for a higher bid, frequently interspersed with nonsense

syllables that enhance the singsong rhythm of the chant. Most auctioneers punctuate their sales with jokes, stories, and personal exchanges with individuals in the crowd, all of which serve to keep people involved in the sale and to bolster the atmosphere of community and play that permeates the general sale. Community-based values and experiences shape these exchanges, which help the auctioneer balance the need to push

the bid higher with the need to maintain a personal rapport with buyers.

Narratives told about auctions comprise yet another traditional genre that sheds much light on the nature and meaning of the auction sale. Frequently told as personal narratives or as the experiences of the infamous friend of a friend, these tales and anecdotes educate auction attendees about the specifics of the auction process and its role—both actual and perceived—in a community. Stories regarding unintentional (and generally outrageous) purchases accomplished through a wave to a friend or the scratch of an ear, and stories involving great treasures uncovered through the purchase of junk merchandise (the sofa or baking soda can stuffed with bills), circulate regularly in any community where auctions are held. The latter story is particularly interesting in that generally the marvelous treasure is returned to the estate—a remarkable act of generosity underscoring the perception of the auction as a community-based and equitable means for the redistribution of property

Austin, Mary Hunter (1868–1934)

Writer best known for nonfiction and fiction works on nature and native cultures in California and the Southwest. Born and raised in Carlinville, Illinois, she moved to central California in 1888. In 1892 she began a prolific career pursued in Carmel's art colony after 1905, in New York City and Europe, and in Santa Fe's art colony from 1924 until her death.

A mystic and naturalist with a college degree in sciences, Austin developed her environmentalism in arid and semiarid regions and was active in the Western conservation movement, including campaigns against the Boulder Dam project in the 1920s. An antimodernist, she proposed ecologically and artistically integrated "folk-life" as the antidote for American rootlessness, and native village socialism as an alternative to 1920s European communism. Her regionalism highlights the sociocultural contributions of women, Hispanics, and especially Indians to an envisioned "multiethnic democracy" grounded in authentic indigenous expressions. In 1925 Austin helped organize both the Indian Arts Fund and the Spanish Colonial Arts Society in Santa Fe, New Mexico.

Austin wrote and lectured about folktales, folk drama, and various other folk arts, but her most extensive folklore research focused on Amerindian song/poetry, a model for poetic evolution in all societies and the measure for true American poetry because of its attunement to a set of rhythms peculiar to the American environment. The crucial "landscape line" involves melody, emotion, and ideation. She did song and tale translations/reexpressions, criticizing both anthropological and literary folklore collectors and translators for exercising too little or too much "creative intelligence." Although never fully accepted by either ethnologists or literati, Austin was influential in publicizing the Indian cultures she primarily championed.

Autoharp

A type of zither played by pushing down chord bars. It was designed by Karl August Gutter in Markneukirchen, Germany, in 1884 and first manufactured in the United States in 1885 by Charles F. Zimmerman.

The autoharp consists of a wooden sound box with thirty-six to thirty-eight strings tuned to either a chromatic or a diatonic scale. From three to twenty-one movable bars, called chord bars, are suspended across the strings. The bars have felt pads attached, and these pads are spaced on the chord bar so that when they are pressed against the strings, certain strings are dampened. The undampened strings make up the notes of a designated chord. By pushing down a series of chord bars and strumming or plucking the strings, either a musical accompaniment or a melody can be played.

In 1871 Zimmerman patented a system of numerical musical notation. To promote its use, he designated a stringed instrument that he called an “autoharp” and patented in 1882. However, when he began manufacturing the instrument in 1885, it deviated greatly from his original design and more closely resembled the *volkszither* patented in England by Karl Gutter. It is thought that Zimmerman used Gutter’s design because it was easier to manufacture.

Autoharps have been manufactured by several different companies since then. A popular instrument between 1892 and 1897, with 300,000 produced, it declined in popularity until the 1950s when Oscar Schmidt International began promoting the instrument to school music programs. This promotion and the 1960s “folk revival” spurred its continuing popularity.

The development of the autoharp as a folk instrument was molded by publications. There have been few autoharp teachers, so people learned to play from self-instructional books included with their instrument. The earliest of these was *Collection of Popular Figure Music for C.F. Zimmermans Miniatur* [sic] *Autoharp*, published in 1885.

Depictions of playing the autoharp in the 1890s show it lying flat on a tabletop or on a horizontal stand. The strings were plucked or strummed below the chord-bar assembly. The manuals of the 1890s instructed the student to do rhythm accompaniment strums with the thumb and first finger and pluck melody strings with the first finger. The autoharp was used mostly for accompaniment and acquired the nickname “idiot zither” because it was so easy to play in that way.

In the 1890s, the autoharp began to be played as a melody instrument. Between 1895 and 1897, Aldis Gery toured the United States with the Victor Herbert Band playing popular tunes on a “Concert Grand” autoharp. Around 1900 the autoharp was introduced to the Southern mountain region through mail-order catalogs and door-to-door sales. It was also the “mountain piano” of rural missionaries.

Mike Seeger documented several playing styles of the early 1900s on the 1965 recording *Mountain Music Played on the Autoharp*. All of the players laid the autoharp on their laps or on a table. They played the strings below the chord bars. Their repertoires consisted of waltzes, hymns, and simple reels. Neria Benfield from North Carolina played melody notes with the back of his first fingernail plucking the string in a frailing banjo style. Accompaniment was done with the thumb or first finger. Ernest Stoneman from Virginia plucked the melody string with his first finger and simultaneously plucked

a bass harmony note with his thumb. Accompaniment was done by the thumb or the first finger moving back and forth across the strings. On September 6, 1924, Stoneman made the first record using the autoharp. Sara Carter popularized lap-style playing when she played rhythm accompaniment on the autoharp with the Carter Family from 1927 to 1943. This style of playing was common until the 1950s.

In the 1950s, Maybelle Carter, who played guitar with the Carter Family, began performing on the autoharp holding it upright against her chest. This made it easier to play into a microphone. She also began playing the strings above the chord bars, which gave the instrument a softer sound. This style became known as the “Appalachian style,” and by the 1970s it had almost completely replaced lap-style playing. Meg Peterson authored several instructional books in the 1960s that illustrated this new style.

Prior to the 1970s, autoharp strings were tuned to a chromatic scale. Then Bryan Bowers, a popular performer, began tuning his strings to a diatonic scale. This allowed him to double tune some strings to the same tone, much like a twelve-string guitar. Tuned this way, the autoharp produced a fuller sound. Bowers still played in a traditional “closedchord style,” pushing a chord bar against the strings for every melody note played. Ron Wall developed a method of playing with diatonic tuning in an “open-chord style,” in which some of the melody strings are played without any chord bars being depressed. Now autoharps are tuned to many different scales, and they are played in both open-and closed-chord styles.

The most comprehensive review of autoharp history is Becky Blackley’s *The Autoharp Book* (1983), which includes descriptions of all autoharp models from 1885 to 1983. In 1963, A.Doyle Moore published the first scholarly paper on its history.

The first magazine for autoharp players was *Autoharpoholic*, published by Becky Blackley beginning in 1980. Other magazines and newsletters that followed were *Autoharp Teachers Digest*, *Autoharp Quarterly*, and *Autoharp Clearinghouse*.

The autoharp’s appearance has not changed much since 1885, and instructional books and magazines still influence its development. A recent trend has been the organization of autoharp contests, clubs, and festivals. Autoharp performers play jazz, blues, Celtic music, and New Age music, in addition to the traditional American music.

Ballad

A song composed in stanzas sung to a repeating tune that recounts a short, usually single-episodic, tale of complication, climax, and resolution. Since it tells a story, the ballad exhibits certain traits common to other narrative forms of folklore like epic song and fairy tale: It concentrates on the leading character, features two interacting protagonists to a scene (seldom more than three actors in the whole drama), and is a solo performance piece, though it may have a refrain or a chorus for group participation.

Of the several forms of American folksong, ballads have received the bulk of scholarly attention, and of that bulk the Anglo American ballad has received the largest share. It is to the Anglo American tradition, therefore, that this entry is pertinent, though many of the generalizations also apply to Mexican American traditions (especially the romance and corrido genres) and to some African American traditions. Indeed, one of the ballad types discussed below, the blues ballad, is found in the repertoires of both Black and White folksingers. At the most general level, we customarily distinguish four subtypes of ballad in Anglo American culture: the medieval, or Child, ballad, the broadside ballad, the blues ballad, and the parlor ballad.

The medieval ballad is the oldest. It emerged somewhere in Europe in the late Middle Ages, was fully established as a popular song type in Britain by the late 15th century, and flourished in Scotland especially up to the late 1600s. After 1700, however, almost no new songs were made in the style, though many of the existing ones remained popular in British oral tradition; not surprisingly, many were brought to America and incorporated into our everyday singing occasions. When, more than a hundred years ago, the American scholar Francis James Child set out to make a comprehensive survey and catalog of the British Isles tradition of this medieval ballad type, he could find a total of 305 distinct ballads in the documentary record, some reprinted in old songbooks and street-poetry flyers ("broadsides"), some in published anthologies of songs gathered from oral tradition, and still others in unpublished manuscripts and field notes of 18th- and 19th-century folksong collectors. Child brought together in a single exhaustive work, *The English and Scottish Popular Ballads* (1882–1898), all of the versions he could find in his library and archival research, assigning each ballad a number for easy identification and comparison. Most of the 305 he found in several versions from different sources, the number of versions reflecting just how popular any particular ballad had been, how often it had been printed, and how often it had been collected from oral tradition. In honor of Child's seminal work, ballad scholars have given his name to the genre.

In its British tradition, the Child ballad encompassed a range of topics, which can be conveniently divided into four categories: (1) magical and marvelous (the stories that turn on supernatural agency, some grounded in pre-Christian beliefs, some in Christian ones); (2) romantic and tragic (which turn on everyday domestic affairs, mostly love relationships); (3) historical and legendary (ballads on actual events, such as a battle or a crime, or on historical-like topics, such as an exploit of Robin Hood); and (4) humorous. The ballads of the second group, romantic and tragic, are the ones that best transcend cultural and historical specifics and display a more general appeal; they are the kind most likely to be found in panEuropean tradition and, similarly, are the ones most likely to have made the transatlantic crossing and become popular in America.

The specific features that distinguish the Child ballad from its more recent relatives constitute its particular *way* of telling a story. For instance, Child-ballad style tends to be impersonal; that is, not only is the story in third person but it seldom proselytizes. In other words, it doesn't include specific instructions in its text as to how a listener should react to, or evaluate, the personalities and events in its story. It prefers to just present the facts, and one must infer feeling and moral value from what the characters say and do.

The Child ballad also tends to be less expository than the broadside style; it virtually plunges into the heart of its tale, with very little lead into the complication, and ends just as suddenly after the climax has been reached and a resolution swiftly achieved. It tells its tale dramatically, almost acting it out rather than relating it—for example, by often not ascribing its dialogue to a specific speaker. It just gives the speech, and the speaker is implied. Even its imagery is dramatically exaggerated—hair bound with gold, horses shod with silver, roses and briars growing over dead lovers' graves and entwining, and so on. Yet another trait the Child ballad shares with a nonnarrative song genre, the lyric is a strong reliance on stylized, formulaic verse. Certain stanzas appear again and again in different ballads, creating a kind of reservoir of reusable epithets to cover similar situations. Suicides, for example, will usually be described with some variant of "He put the sword handle against the wall/The point against his breast," a bedtime with "The day being gone, the night coming on/ While all men were asleep." Then there is a recurring metrical trait: Child-ballad verse is most commonly of two strophic types, a four-line stanza accented 4/3/4/3 or a two-line stanza accented 4/4.

Though, like all folklore, Child ballads adapt to their environments, contexts, and even settings of performance so that we frequently find variations that localize, modernize, rationalize, or jocularize some old-fashioned or simply too unfamiliar content, a further feature of the type is that modern-day versions still more often than not retain a premodern ambience to their content. Thus, many American versions of these old British ballads still talk about lords and ladies, castles, and ghosts. Finally, perhaps the most striking trait of all, in their structure the Child ballads incorporate a feature most prominent in non-storytelling catalog songs and combine it with storytelling purpose to achieve a highly redundant style of narrative progression that relies heavily on repetition, both exact and incremental, on twofold and threefold parallelisms, and on framing structures that imbed and nest constituent parts within each other in an overall design of great formal symmetry and balance. The repetitions and parallelisms tend to freeze the story, as it were, by lingering on an action for several stanzas before moving on to pause at the next tableau (a technique sometimes called "leaping and lingering").

An excerpt from a Missouri version of Child 81 will illustrate several of these aforementioned traits. Lord Arnold has just surprised Little Matthy Groves in bed with his wife:

“And it’s how do you like my fine feather-bed,
And it’s how do you like my sheets?
And it’s how do you like my gay ladie
That lies in your arms and sleeps?”

“Very well do I like your fine feather-bed.
Very well do I like your sheets
But much better do I like your gay ladie
That lies in my arms and sleeps.”

“Now get you up, little Matthy Groves,
And all your clothes put on;
For it never shall be said in Old England
That I slew a naked man.”

“I will get up,” said little Matthy Groves,
“And fight you for my life,
Though you’ve two bright swords hanging by your
side
And me not a pocket knife.”

“If I’ve two bright swords by my side,
They cost me deep in purse,
And you shall have the better of the two
And I will keep the worse.”

The very first lick that little Matthy struck
He wounded Lord Arnold sore.
But the very first lick that Lord Arnold struck
Little Matthy struck no more.

The broadside ballad style, which succeeded the medieval type in popularity and which remained vital as a compositional model up to the end of the 19th century in the song traditions of North American regional and occupational groups (logging, ranching, coal mining, seafaring), though it lost popularity in more urban centers a bit earlier, coalesces as a distinct type in Britain after 1700. “Broadside” refers to the method by which many

of this type of song made their initial appearance: cheaply printed on single sheets of paper and sold at street corners, market stalls, and fairs by itinerant peddlers. The songs tended to be on actual topics—sensational crimes, military victories, accidents and disasters that claimed many lives—but were often imaginary as well, *especially* when the topics were about courtship and love relations in general.

The conventions of the broadside style can be contrasted with those of the older Child style. For example, the broadside way of telling a story in sung verse tends toward subjectivity; often in first person, often featuring the narrator as an actual participant in the drama, often explicitly passing judgment or loading with sentiment the circumstances related, broadside style has certain similarities with the lyric song. The broadside style is also more expository; in what is often a very journalistic way, it specifies details of time, place, personnel, motive, and so forth that tell more about what's going on, providing an explanatory as well as an interpretive context for its events in a way the Child ballad generally eschews. And broadside ballads aren't as dramatic: Word use is closer to conventional language than is the stylized, exaggerated word use of the older form, and dialogue is ascribed to its speaker rather than just given.

Broadsides are less formulaic than Child ballads, not necessarily in their plots but in the language—their epithets, lines, and stanzas; we don't find as many “floating” verses reused to say essentially the same thing in different ballads. Many broadsides also feature a metrical pattern that extends the shorter ballad stanza considerably to 7/7/7/7 (that is, seven stresses per line in a four-line stanza), though this particular trait seems to be much indebted to the Irish strand of broadside traditions in the New World. Finally, the structure of the broadside style reflects its greater dependence on print for its composition and diffusion, for it does not display nearly the

Mr. and Mrs. Frank Pipkin record for Charles L. Todd. Seen by some as the embodiment of "Ma Joad" in John Steinbeck's novel The Grapes of Wrath, Mrs. Pipkin excelled in singing English ballads. Shafter, California, about 1940. Photo Robert Hemmig. American Folklife Center.

internal redundancy—the catalog trait—of the more highly patterned Child style. The broadside style is more linear and chronologically continuous from stanza to succeeding stanza, with less repetition, parallelism, framing, and “leaping and lingering.”

Illustrative of the broadside style are the first five stanzas of a ballad on a murder in Sullivan County, Missouri, in 1894:

About one mile from Brown town, at the foot of Jenkins' hill,
Took place this awful murder by the Taylors, George and Bill.
Gus Meeks' wife and children were taken from the [their] home,
Were taken by those Taylors to meet their fatal doom.

They wrote to Gus Meeks a letter telling him to be ready at ten
And try to leave the country to save his grace [disgrace] from them.
How little did he think them those Taylors, George and Bill,
That night would murder his family upon the Jenkins hill.

But the hand of Providence came to little Nellie and said [Nellie's
aid],
Ere the break of morning safe escape she made.
She came out of her straw-made grave and to Carter's house she
came
And told this mournful story, that adds to our country's shame.

She stood before the doorway with that awful gash in her head;
While she sobbed and wept most bitterly these were the words she
said:

“Some very cruel men last night came and took us from our bed.
They shot our papa and mama, and thought us three were dead.

“Thev nut us in our wagon and took us to our strawmade grave.

How little did they think them their sad little Nellie would save!
 But Providence was against them; the righteous hand was there
 And willed against those murders little Nellie's life to spare."

G.Malcolm Law Jr. has cataloged broadside ballads in American tradition, placing them in two logical divisions for the purpose: ballads that originated in the British Isles (Laws 1957), and ballads that were made on this continent and treat what are more or less distinctive North American experiences (Laws 1964). Some topics are common to both kinds: for instance, ballads of war, of sailors and the sea, of crime and criminals. More interesting are the differences. In general, broadside ballads originating in Britain and Ireland that took root in American singing tradition heavily favor what the Child ballads that flourished here favor—stories of love affairs that had no actual historical event behind them (stories about parents opposing their childrens' choice of mate, and stories of lovers who employ some disguise or trick in the machinations of courtship were particularly popular)—while ballads made in the United States and Canada tend to favor male occupational experiences, principally of the outdoor, laboring kind (such as cowboying and lumbering), as well as the more sensational sort of topic that Laws places in categories of "murder ballads" and "ballads of tragedies and disasters." These topics are not unknown in British ballads that diffused to America; they simply are not as numerous, as patterned, and as interrelated as indigenous ballads on the same subject and so were incorporated into other categories. The primary value of Laws' catalogs are not as typologies, however, but as systematizations: He gives each ballad an identificatory letterand-number combination for ease of identification—thus, for example, "The Meeks Family Murder" given above is Laws F28.

Unlike the Child and broadside models, the third way of telling a story in song found in Anglo American folk tradition, the blues ballad, is home grown, though similar forms can be found in other cultures, such as Irish Gaelic. Indeed, in both its genesis and its life history, the model is as much an African American one as it is Anglo American. As its name implies, the type emerges from the fusing of the ballad's narrative way of articulating images in sung verse (predominantly a White tradition) with the lyric song's emotive way (in this case, chiefly the Negro lyric style). Like a broadside ballad, though often in a somewhat impressionistic and elliptical way, a blues ballad's topic is situated in an actual event and features an array of specific characters, settings, materials, and actions; like the lyric, however, the song is unified by a heightened mood of lament or celebration rather than by a story line, often drawing as well from a pool of formulaic imagery:

They took him to that cemet'ry
 In a rubber-tired hack,
 They took him to that cemet'ry
 But they did not bring him back.

As far as plot is concerned, the blues ballad is not as linear and continuous as the broadside, favoring the more tableau style of the Child ballad, moving forward to be sure but from striking scene, to dramatic confrontation, to evocative speech in a sequence that is often as much associational as it is chronological. We also often find in blues ballads the repetitions, parallelisms, and other symmetries intrinsic to the Child style:

Sol Matting he lied a-sleeping,
 Poor boy was sleeping so sound,
 When the fire took place in the deck-room
 The night the Bicera burned down.

Chorus: O! the Bicera she hollered,
 O! the Bicera she moaned;
 The City St. Louis did answer
 The night the Bicera burned down.

When she left St. Louis
 She had five hundred men;
 When she got to New Mattick
 She hadn't but a hundred and ten.

Ain't that a pity,
 Ain't it a sin and a shame,
 The fire took place in the deck-room
 The night the Bicera burned down.

The Bicera was a fine boat.
 O! the Bicera she moaned;
 But when she got to New Mattick
 O! the Bicera was gone.

The Bicera was a fine boat,
 Her smoke stacks painted brown,
 When the fire took place...

O! Sol Molting [*sic*] he whooped and he hollered,
 Sol Molting he hollered so strong;
 When the fire took place in the deck-room
 Poor Sol Molting was gone.

Like many African American recreational-song genres, but unlike Anglo American, Child, and broadside ballads, the blues ballad in performance was usually dependent on instrumentation, the singer accompanying himself or herself on banjo or guitar, and instrumental breaks between groups of stanzas were common.

While the Child and the broadside ballad types are widely recognized and studied by folksong scholars, there is less consensus on the status of the blues ballad and, consequently, less scholarly literature on the subject. This is even truer of the fourth ballad type, the parlor, or sentimental, ballad (itself one kind of the more general parlor song, which may come in ballad or in lyric manifestations). The parlor ballad has forebears in Britain that go back several centuries, but those found in American domestic singing tradition by modern-day folksong collectors are mostly of late-19th-century origin, originally popularized in some formal milieu or other, such as a variety hall, a traveling minstrel show, a Chautauqua, or a temperance society meeting, and widely disseminated through songsters and sheet music. As a result, a parlor ballad's composer is often known to us, which is rarely the case with blues ballads, virtually never with broadside and Child ballads.

The distinctiveness of parlor-ballad poetry (tunes tend to be quite distinctive as well) seems to lie in the generally bourgeois sensibility that informs it. Parlor songs in general display more conventionally genteel, refined, elevated feeling and morality, often indeed to the point that, to the outsider, their patriotism appears jingoistic, their virtues pious, their sentiments maudlin. While their composers were undoubtedly more knowledgeable in formal poetic techniques, so that alongside other traditional ballad types parlor ballads appear less formulaic in language and content, more unified in plot and theme, more regular in meter and rhyme, more heterogeneous in verse formats, they do not project to the academic sensibility a world honestly experienced and represented. Plot and character seem contrived, the evocation of emotion manipulative:

I saw a man at early dawn
 Standing by the grogshop door.
 His eyes were sunk, his lips were parched;
 I viewed him o'er and o'er.

Refrain: I viewed him o'er and o'er,
 His eyes were sunk, his lips were parched;
 I viewed him o'er and o'er.

His little girl stood by his side,
 And as to him she said,
 "Father, mother lies sick at home,
 And sister cries for bread."

Refrain: And sister cries for bread, etc.

He staggered off up to the bar,
 Where he had been before,
 And faltering to the landlord said,
 “Oh, give me one glass more.”

Refrain: Oh, give me one glass more, etc.

The landlord arose at his command
 And filled the liquid bowl.
 He drank while wife and children starved
 And ruined his own soul.

Refrain: And ruined his own soul, etc.

Like other kinds of parlor songs, parlor ballads seem dependent on the premise that song should be ennobling, uplifting, or educational; hence they are invariably grounded in value orientations and worldviews that seem indebted to middle-class aspirations and the idea of polite society. Although lumbermen sang them in bunkhouses and sailors at the forecandle, the “parlor” rather than the “porch” seems to us their natural setting for folk performance, the piano rather than the banjo their appropriate supporting instrument. But in the quotidian contexts of their performance, they were no less real for all that, as meaningful and functional to those who sang them as was an outlaw blues ballad to a Louisiana penitentiary inmate, a murdered-pregnant-sweetheart broadside ballad to an Indiana farmwife, or a Child ballad about lords and ladies astride silver-shod steeds and living richly passionate lives to an Appalachian mountaineer.

Baltic Peoples in the United States

Lithuanian, Latvian, and Estonian Americans. Each is a distinct ethnic group and maintains a unique language and culture. The 1990 U.S. Census reported 812,000 persons of Lithuanian ancestry, 100,000 Latvians, and 27,000 Estonians. The largest Baltic communities may be found in New York City, Chicago, and Los Angeles, while Toronto is a center of Baltic activities in Canada. For Baltic immigrants, the reasons for leaving the homeland define the kinds of group traditions that will be maintained in America. A brief historical overview of the waves of Baltic immigration, therefore, provides a good introduction to Baltic American folklore today.

Baltic *economic immigrants* began arriving while the territory of today's Baltic republics was still part of the Russian Empire. They arrived in America seeking the opportunities offered by expanding American industry—finding work, for example, in textile mills, furniture factories, and steel mills. The largest numbers of Baltic immigrants came from rural Lithuania, settling in the coal-mining towns of Pennsylvania, the industrial cities of the Northeast, and in Chicago, which is believed to have the largest population of Lithuanians outside Lithuania. Around 1880, Latvian and Estonian immi-

grants also began to establish communities in New York City, Boston, Philadelphia, and Chicago.

Having no Social Security system, the immigrants organized social-welfare societies and lodges to provide for themselves in illness and after death. They founded church congregations to continue the mainstream religious customs of their homelands (Lutheran for Estonians and Latvians, Catholic for Lithuanians), singing the songs and reciting the prayers that maintained their faith in the old country. At the turn of the century, *religious persecution* by the Russian government stimulated another, albeit much smaller, wave of emigration, when groups of Estonian and Latvian Baptists left for the religious freedom of America.

After Estonia, Latvia, and Lithuania became independent in 1918, emigration took place largely for economic reasons, tapering off in the mid-1930s with the end of the economic Depression in Europe. The founding of the three independent states found echoes in Baltic American patriotic societies, which sent aid to their war-torn homelands in the early 1920s, petitioned the U.S. government to give political recognition to the three states, and popularized the culture of Lithuania, Latvia, and Estonia among the American public—for example, in exhibits at the World's Fair Expositions in Chicago and New York City.

Baltic socialists arrived in the United States both legally and illegally after the failed Revolution of 1905, finding refuge in America from arrest and execution in Russia. Socialist organizations fostered a lively intellectual culture, establishing libraries of books from the homeland, theater troupes, and even schools with instruction in the native language. They maintained the political traditions of their class in the Baltics, actively participating in the American socialist movement. Their ideology conflicted with that of the Baltic American religious and patriotic organizations, and the political divisions within each group sometimes ended in violent confrontations.

World War II caused the massive emigration of Baltic *political refugees*. Estonia, Latvia, and Lithuania were occupied and annexed in 1940 by the Soviet Union and remained under Soviet rule after the war. Persons living in the Baltics were not allowed to leave the USSR, but several hundred thousand had fled to the West during the war. The refugees were unwilling to return to the Stalinist terror in their homelands, and lived in temporary displaced-persons (DP) camps before they dispersed around the globe from 1948 to 1950. Some 100,000 were allowed to settle in the United States.

The Baltic political refugees organized communities with a mission that was both cultural and political. They had left their homelands, not as emigrants seeking a better life, but as exiles whose goal was the preservation of the Baltic cultures and the continuation of the battle for political independence lost in 1940 (see Carpenter 1988). They purchased churches, community centers, and rural retreats as “miniature homelands” to substitute for their countries imprisoned behind the Iron Curtain, and they established weekend schools, summer camps, Scouts, folk-dance troupes, and other youth activities to pass their language and culture on to American-born generations. National organizations held public demonstrations and lobbied the American government for policies favorable to renewed Baltic independence. It was the conscious maintenance of an identity as political exiles that brought about the blossoming of Baltic ethnic traditions in the United States after the early 1950s.

The most recent wave of Baltic immigrants began with the breakup of the USSR. When the former Soviet borders began opening in the 1980s, the first to emigrate were political dissidents expelled by the government. Later, a new trickle of Baltic economic immigrants began entering the United States. Baltic Americans have recently been moving to the Baltic, too, and cultural and social ties between the American ethnic groups and the three homelands are expanding.

Language has provided the main force of cohesion and survival in the communities and traditions of the Baltic immigrants. The emergence of language loyalty among Lithuanians, for example, caused them to break away from the Polish-speaking congregations they had joined in the 19th century. Most Baltic immigrants followed the pattern of assimilation typical of American immigrants, with the second, American-born, generation not speaking the language of their grandparents. As the language died with the immigrant generation, many folklore traditions were also forgotten.

Archaic folklore that immigrants remember from life in the Baltic countryside has been collected, for example, by Jonas Balys, who in 1949 and 1950 recorded more than one thousand Lithuanian songs, tales, legends, and riddles from prewar immigrants. A blind Latvian immigrant, Janis Plavnieks, told traditional folktales, anecdotes, personal-experience narratives, riddles, puzzles, and songs to his folklorist granddaughter, Inta Gale Carpenter (1980). Much remains to be done, however, in the study of archaic Baltic folklore in the United States. The folksong collections of Balys, Elena Bradunas, and others deserve much further analysis. Much priceless material has been lost with the passing away of Latvian and Estonian immigrants.

Material traditions also survive tenaciously among immigrants. A Lithuanian garden rarely lacks rue (*ruta*, *Ruta graveolens*), a green-leafed plant believed to be the young woman's companion; a sprig of rue is likewise an important part of the Lithuanian bride's dress. Berry plants and trees in the Baltic garden are often traditional favorites, which are not common in mainstream American gardens: Gooseberries, raspberries, red and black currants, apple trees, birches, and lindens, for example, have long been loved by Baltic farmers, poets, and immigrants alike.

Food traditions reflect both urban and rural roots. Meat preserved in aspic (Es. *silt*, La. *galerts*, Li. *drebucai*) was a popular food in both cities and countryside, and older immigrants still enjoy it with horseradish or vinegar. Their grandchildren, however, often dislike the mere idea of eating meat jelly. Both in America and in Latvia, the *klingeris*, a large, pretzel-shaped bread flavored with cardamom, colored with saffron, and decorated with almonds and powdered sugar, has been present at urban Latvian birthday celebrations for several generations. At Christmas, Estonians prepare *verivorst* (blood sausage), recalling the winter holiday traditions of their rural ancestors. Estonians and Latvians alike bake small bacon buns (Es. *pirukas*, La. *pirags*) on special occasions. Lithuanians prepare a rich variety of foods from rural tradition, including *cepelinai* (potato dumplings filled with meat) prepared from what Baltic Americans usually agree is the staple food of their nations: the potato.

Folklore also emerged out of the immigrant experience, in the clash and merging of two foreign cultures. Immigrants both follow and transform the old-country tradition of the death announcements printed in native-language newspapers. The name of the departed is printed in bold type, surrounded by a black border. Along with the birth and death dates and names of surviving family members, excerpts from poems, folksongs,

and hymns are included to reveal the individual's personality and traditional attitudes toward death. Many of these memorials refer to the sorrow of life in a foreign country (America) and to dreams of the faraway Baltic homeland.

A similar immigrant tradition is found in American cemeteries having Lithuanian, Latvian, or Estonian sections. Tombstones reveal a personal side of immigrant traditions, expressing religious convictions and attachment to the homeland in epitaphs and ornate traditional carvings. In any Baltic American cemetery, some epitaphs are written in the native tongue, others in English, still others in a mixed language. Whether they reveal a longing for the homeland with phrases from patriotic poems, or a longing for eternity with quotations from church songs and the Bible, the stones cluster together in a declaration of the ethnic identity and community cohesion of their makers.

The merging of individual and ethnic identity appears in other traditions as well. The folk art of a Lithuanian immigrant, Joseph Mender, synthesized many identities and ideologies. Long ago, he learned to make wooden canes from tree branches from his grandfather in Lithuania. The figures and words he carved and painted on these canes, and an enormous collection of miniature pictures he drew, reveal a complex identity based on a composite of memories from childhood in Lithuania, the Catholicism of his relatives, socialist ideology strengthened during work in an American factory, and pre-Christian Lithuanian religion as described in the books he avidly read in his home in upstate New York (Biella and Lux 1990).

Baltic communities consciously maintain customs that foster ethnic unity. The three National Independence Days (Estonia, February 24; Latvia, November 18; Lithuania, February 16) are often considered most important to the communities as a whole and are celebrated at assemblies featuring speeches by both community leaders and local politicians and concerts. Soon after World War II, a day of national mourning was established on June 14 to commemorate the date in 1941 when the Soviet government began the deportation of hundreds of thousands of Baltic citizens to Siberia. In church and at home, Baltic Americans also celebrate Christian holidays (Christmas, Easter, Catholic Mardi Gras for Lithuanians) according to the traditions they have inherited from their homelands. Midsummer night, June 23, is held outdoors according to peasant traditions, with large bonfires, beer, and songs. Latvian non-Christian religious groups called *Dievturi*, and the Lithuanian *Romuva*, revive the pre-Christian customs of the seasonal cycle.

Cultural displays place ethnic traditions in the open, defining to the members of the group as well as outsiders what it means to belong to that group. Unlike the folklore of immigrants, who made traditional foods because they were tasty and easy to prepare, or sang songs to express their emotions, the ethnic groups usually ascribe a meaning of ethnic identity to nearly all forms of Baltic folklore.

What has been called folklorism, the conscious use of folklore as an ethnic or national symbol, has roots in the three Baltic cultures that reach back two centuries. The German philosopher Herder, who praised the beauty of the folksongs of the Estonian, Latvian, and Lithuanian serfs, established national symbolism still maintained by Baltic Americans. They continue the modern singing traditions of the 19th-century Baltic national movements, in which songs collected from oral tradition were arranged for performance by massive choirs on stage. Most dramatic are the national song festivals, at which choirs from across the continent perform together in a single choir of up to a thousand singers.

Baltic American festivals include many other ethnic traditions. Handmade clothes have been meticulously studied and copied from ethnographic publications from the 19th century. Handcrafted jewelry replicates pieces found in archaeological digs in the Baltic. Amber, which has for centuries been washing up from the Baltic Sea onto the western beaches of Lithuania and Latvia, is the favorite stone in necklaces and brooches. Musical instruments derived from Baltic folk tradition, in particular the Estonian *kannel*, Latvian *kokle*, and Lithuanian *kankles* (all variations of a zither-like instrument) are played on stage or displayed in exhibits of folk art. Many Baltic folklore traditions continue in America, in the cultural displays put on at international festivals, as well as in the more personal context of family gatherings such as weddings or funerals.

Banjo

A plucked-string instrument with a neck, hollow round sound chamber, thin (animal skin or plastic) covering, and bridge. Often considered the emblem of the Southern mountaineer, the banjo actually arrived in this country with Africans in the 18th century, became an integral part of the exchange between Southern Blacks and Whites, and inspired indigenous American music before the mid-19th century.

The banjo brought to the Americas is related to the Wolof *halam* and the Mandingo *bania* still played in 20th-century Africa. Early written records prove that slaves, including Wolofs, either brought the gourd instrument with them from Africa or reconstructed the “banjar” with local materials as early as 1740. Early paintings and drawings clearly identify the short, drone string of the instrument. For almost a century, only African Americans played the banjo; it echoed the traditions of their homeland and paced their songs and dances at community gatherings. A drum-banjo ensemble dominated performances in the Louisiana area, but in the Upland South, an older stronghold of the tradition, individual banjo performances accompanied by clapping or other percussive improvisations persisted tenaciously, especially after the end of the 18th century, when laws curtailed drumming in the East.

In the middle of the 19th century, White Americans became fascinated with the Black banjo tradition. In the Southern mountains, at dances and celebrations far from the popular stage, the African American “short-thumb-string” banjo and the complexly rhythmic “thumping,” or downstroke, playing style took hold. Black banjo players lived on the mountain frontier by 1800, and the ancestors of mountain Whites had earlier contact with Black musical traditions in the Piedmont. Before 1850 and increasingly during the musical exchange of the Civil War, musicians began to set the African banjo, now often adapted to have a smooth wooden neck and a wooden-rimmed open back, ringing with the European fiddle. This interchange was especially energetic among African Americans and Celtic Americans. White interest in the African American gourd banjo resulted in the innovation or popularization of the fiddle-banjo ensemble and later in the old-time string bands finally documented on records in the 1920s and 1930s.

By 1840 White fascination with the banjo had also led to the invention of stage minstrelsy (Whites in blackface devoted to the imitation—often a caricatured parody—of Blacks). Minstrelsy moved from the circus ring to its own stage and became one of the first and most applauded indigenous expressions of popular culture. The development of the fivestring, wooden-rim banjo extended the instrument’s rhythmic range to include greater melodic possibilities and added durability useful to traveling performances. The minstrel tradition later stimulated a flourishing of classical parlor and orchestral styles and of ragtime picking. The 19th-century banjo exchange also shaped the 20th-century innovations of the

tenor banjo (played with a plectrum in quartets and jazz bands) and the bluegrass banjo, which emerged with its finger-picking styles at the time of the increasing industrialization of the South during World War II. While classical, jazz, and ragtime styles dispersed, the most vital folk styles, downstroking and up-picking, remained strong, close to their roots in the rural South. Two-finger up-picking, acquired from Blacks by minstrels before 1865, also emerged in the rural South. These developments laid the groundwork for the harddriving, syncopated, bluegrass style popularized by Earl Scruggs and others.

While the old-time five-string folk banjo tradition was still strongly shared by Blacks and Whites during the last half of the 19th century, the complex trading of song material between these musicians gave rise to a distinct genre of American folk music—the banjo song. Although initially and predominantly influenced by African American tastes, the diverse and continuing exchange of these songs came to reflect the influences of both traditions. Old-time African American banjo playing began to decline in the first decade of the 20th century, soon after inexpensive guitars became readily available and at the time that Jim Crow laws became increasingly restrictive for Blacks. Shaped by the banjo-song genre, the songster qualities of the guitar, and industrial encroachment, a growing sense of African American community resistance began to emerge in the blues. But still today, in the performance of both White and Black old-time musicians, the echo of the old African American banjo rings. The instrument itself—the fretless, short-drone-string banjo—its “thumping,” downstroke playing style, its special tunings, and its repertoire of lyric banjo songs persist among both Southern Whites and some Blacks. These same traditions were influential in the folk revival popularized by Pete Seeger, the New Lost City Ramblers, and Southern bands like the Hollow Rock String Band and the Highwoods.

Though other Europeans, some of whom were German, made five-string banjos and contributed to the availability and influence of the instrument in the 19th century, banjo musical exchange seems to have taken place primarily in the rural South between two especially gifted groups: African Americans, including Wolofs, and Celtic Americans, many of whom were Scots-Irish and Irish. The fact that the interchange flourished in the 1840s supports this pattern, for at that time the Irish who emigrated to escape the potato blight began to reinvigorate and diversify the Scots-Irish fiddle tradition and other musical trading. Ireland was one of the early places toured by the first full minstrel band in 1843, and Black banjo pickers still play certain traditional fiddle pieces quite old in Ireland.

The honor of “inventing” the five-string banjo has often rested with Joel Sweeney, a Southern mountain boy of Irish descent who learned to play from Black slaves about 1830 and later became one of the earliest and most influential minstrels. Although Sweeney could have added a fifth string (now called the fourth string) and a wooden rim to the banjo, he definitely popularized these innovations, which served the melodic needs of White performers. He did not, however, add the shortened thumb string (now called the fifth string), which served the musical needs of downstroking (“thumping” or clawhammer) and arrived in the Americas with the ancestors of 20th-century Black musicians like Dink Roberts, John Snipes, and Odell and Joe Thompson.

Some have argued that mountain Whites learned directly from minstrels, but the few reports available tend to identify this early exchange as examples of early minstrels “catching” material from Blacks and White Upland Southerners. The fact that Sweeney himself became a minstrel accounts for considerable folk transmission to the formative players of minstrelsy. That mountain Whites learned directly from Blacks seems apparent from the fact that present-day southern Blacks and Whites share certain special tunings and techniques that are not emphasized and often not even described in the mid-19th-century minstrel banjo instructors. In short, the interest of White mountain musicians and minstrels in African American banjo traditions led to a lively exchange that indelibly

shaped indigenous American folk music and still flourishes as the 20th century draws to a close.

Barbeau, Marius (1883–1969)

Canada's leading folklorist. Barbeau's contribution to Canadian folklore can hardly be overestimated. *The Dictionary of Literary Biography* (92:13–16, 1990) gives an extensive bibliography and describes his career.

He worked at the National Museum from 1911 until his death, and the Canadian press once summed up his work thus:

He gave the national Museum a collection of 195 Eskimo songs, more than 3,000 Indian, close to 7,000 French-Canadian, and 1,500 old English songs. Many of them are still on the old tube-like records that came off his Edison recorder.... "I would need two lives to process all my research," he once said.

The work he achieved in one lifetime was almost unbelievable. In an age of increasing specialization, he ranged over the whole field of folklore and anthropology, collecting, studying, and describing Indian myths, ceremonials, language, music, arts, and culture; French Canadian folktales, folksongs, art, games, handicrafts, and architecture; and Anglo-Canadian songs and art. His books include two novels reflecting Indian life. A prolific writer, and completely bilingual, he published fifty major books, as many more pamphlets and monographs, and 700 articles in a hundred different periodicals ranging from scientific journals to popular magazines and daily papers. His home was a miniature museum of Indian and French Canadian folk art.

In 1947 Luc Lacourcière wrote, "*Monsieur Barbeau a consacré sa vie et ses études à nos traditions populaires. Grâce à lui, le folklore canadien occupe sa place dans l'étude scientifique des traditions comparées,*" and in 1950 F.J. Alcock, curator of Canada's National Museum, wrote the following:

Dr. Barbeau has been responsible for the development of folklore research in Canada, and the wealth of folklore material in the possession of the national Museum of Canada was largely collected by him and the numerous students to whom he has transmitted his enthusiasm for this type of study

Barbeau was a Fellow of the American Folklore Society, and he served as president and associate editor of the *Journal of American Folklore*, for which he prepared ten special Canadian issues. He founded the Canadian Folk Music Society in 1956 and organized the 1961 International Folk Music Council conference in Quebec.

The list of honors he received would fill a page. They include the Gold Medal of the Royal Society of Canada, honorary degrees from the Universities of Montreal, Laval, and Oxford, and the title of Companion of the Order of Canada, the highest honor Canada bestows.

His major books from the National Museum include *Totem Poles* (1950–1951), *Haida Carvers in Argillite* (1957), *Huron-Wyandot Traditional Narratives* (1960), and three massive volumes of French-Canadian songs: *Le Rossignol y chante* (1962), *En roulant ma boule* (1982), and *Le Roi boit* (1984).

Barbeau was no ivory-tower scholar: He tried to preserve and promote folklore in every way he could. He lectured to many groups, wrote popular books and articles, appeared on radio and television, and made several records. His personal charm comes across in *My Life in Recording Canadian-Indian Folk-Lore* (Folkways Records 3502), in which he sings and beats an Indian drum.

Barnicle, Mary Elizabeth (ca. 1898–1979)

Educator and folklorist. Barnicle was an energetic and enthusiastic collector-educator whose work in the area of Appalachian folklife has not been fully appreciated. A Bryn Mawr graduate specializing in medieval English literature, Barnicle taught at New York University from the early 1930s to the late 1940s. While teaching folklore there, she fell under the influence of John Lomax's work and organized a field trip to Georgia, Florida, and the Bahamas to collect folklore in 1935. (These recordings are on deposit at the Library of Congress' Archive of Folk Culture.)

In 1935 she met her husband-to-be, Tillman Cadle, a Kentucky miner and union activist, who had come to New York to visit his friend, Jim Garland, who had suffered a serious mining injury. In 1938 and thereafter, Cadle accompanied Barnicle on a series of recording trips in Kentucky. Her last teaching position was at the University of Tennessee in 1949–1950, but she left there under a cloud, following political problems with a very conservative English Department. Just as she was leaving the university, Barnicle was informed that 200 of her cherished field recordings, which had been on deposit in a campus office, had been misplaced. Deeply hurt by what she and Cadle regarded as the suspicious circumstances of the recordings' disappearance, she lost interest in any further fieldwork.

In 1983, on the shelves of the radio station at the University of Tennessee at Knoxville, folklorist Willie Smyth stumbled upon a cache of 150 recordings that had been made by Barnicle between 1938 and 1949 in the Pineville, Kentucky, area. The 1986 LP recording based on this find is an excellent sampling from her field recordings, together with extensive biographical information.

Barrick, Mac E. (1933–1991)

Major collector of regional folklore in central Pennsylvania and analyst of proverbs, beliefs, jokes, and traditional tools. Barrick graduated from Dickinson College in his native Carlisle, Pennsylvania, in 1955; he went on to the University of Illinois for his M.A. and the University of Pennsylvania for his Ph.D. He taught Spanish and folklore at Villanova University, Lycoming College, and Dickinson College, and after 1968 at Shippensburg University. Barrick compiled a major regional archive of folklore from central Pennsylvania, which is housed at the Center for Pennsylvania Gulture Studies at Pennsylvania State University at Harrisburg. He died in 1991.

Barrick's collections of central Pennsylvania folklore began in the 1960s; drawing on these materials, he developed detailed articles on proverbs, riddles, rhymes, legends, tales, anecdotes, autograph verses, language, games, medicine, and beliefs. In these articles, he showed his mastery of textual analysis from both comparative and contextual points of view. With his knowledge of foreign languages, Barrick scoured books from international libraries to annotate his sources. He appropriately wrote the chapter "Folklore and the Verbal Text" for the American Folklore Society's bicentennial publication, *100 Years of American Folklore Studies* (1988). Barrick developed a series of articles on popular joke cycles and regional folk humor, and he offered one of the first inquiries into photocopied and typescript humor as folklore.

Barrick was avidly interested in preindustrial tools and folk crafts within the context of rural economy and community life. He developed this interest with studies of fishing spears (1972), hay knives (1983), corn knives and husking pegs (1970), scrapers (1979), folk toys (1979), and log houses (1986). In central Pennsylvania, much of his collecting was from the Pennsylvania "Dutch," descendants of German settlers who came to Pennsylvania during the late 18th and early 19th centuries. He expanded his knowledge of German American traditions across the country, and his research led to his book *German American Folklore* (1987). He also worked in Spanish folklore, documenting proverb usage in medieval Spain and Portugal and folklore in the work of Miguel de Cervantes and other writers.

Barrick was twice elected president of the Pennsylvania Folklore Society. He served on the editorial board of *Pennsylvania Folklife* and was an original member of the Folklife Advisory Council for the Pennsylvania Heritage Affairs Commission.

Barry, Phillips (1880–1937)

Most important of the post-Child generation of American ballad scholar-collectors, whose theory of communal re-creation eventually laid to rest the communal theory of ballad origins. Barry based his scholarly writing on both library research and fieldwork and “was the first Anglo-American scholar to investigate traditional song in all its aspects: text, tune, performance, and transmission” (Wilgus 1959:68). Barry brought to his endeavors the unique combination of vast learning, superb academic training, and a comprehensive understanding of musicology. He was a great stimulus to the critical study of the ballad, and his notions of the genre were prescient and far reaching, still exerting their influence on the field.

Educated at Harvard University in the years immediately after Francis James Child, Barry studied folklore, theology, and classical and medieval literature, maintaining a long relationship with his mentors, George Lyman Kittredge, Kuno Franke, and Leo Wiener. This lent him meaningful credibility as a private scholar of independent mind and means, for Barry enjoyed both the respect of the academy and the freedom to devote his time and energies exclusively to scholarship. At the start of his career, the very definition of a ballad was far from settled (the terms “folk-song,” “ballad,” and even “folk music” were used interchangeably). Despite increasingly strident attacks, Francis Barton Gummere’s theory of communal origins held sway. Through extensive fieldwork, exacting documentation, gradual publication, and continual analysis of a growing body of American folksong items, Barry and his peers presided over the sorting out of definition, style, transmission, and other vexing matters left unclear by the great library-centered scholars of the preceding century.

A dedicated collector, Barry followed fieldwork leads from family, friends, and associates, moving beyond these personal networks by placing notices in local newspapers, the *Boston Transcript*, among others. He kept in close contact with other collectors and scholars, contributing both insights and examples to the work of such learned colleagues as H.M. Belden and encouraging hosts of amateur collectors, especially in New England.

Barry’s pursuit of American folk music, beginning in 1903, bore fruit in a steady harvest of folksong texts and melodies, primarily from northern New England and the Maritimes, a region that, until his pioneering work, was thought devoid of migratory ballads. Publishing his results, in such journals as the *Journal of American Folklore*, *American Speech*, and *Modern Language Notes*, initially he was adding Northeast examples to a growing compendium of American folksong texts. His first article, “The Lord Randall Ballad in America” (1903), presents six texts and three melodies of Child 12 and includes a few comments comparing Barry’s collected examples to versions already in print. He was soon working out his ideas, bit by bit, in headnotes to texts and melodies and in a number of ballad histories, making important theoretical advances. His responses and reactions to ideas of other ballad scholars appear throughout his writings, in lively discussions or brief statements like fine tunings, always confidently asserted. Typically, his gracefully written, succinct, and erudite commentaries illumine matters large and small, so that, taken together, they comprise a thorough treatment of his subject.

Working in the era of discovery of American folksongs, Barry ushered in the modern age of ballad studies. Among the more recognized of his accomplishments is his demonstration that songs of the folk, rather than being products of “dancing throngs” composing communally, are instead compositions of “individual invention plus communal re-creation,” a term he introduced in 1907 in an instructive musicological discussion contrasting “traditional” and “composed” airs. He considered the notion to be the very crux of the issue of origins. A song is traditional, he claimed, if it is composed by the folk, first as an individual composition, then communally recreated through the process of transmission. “It should be understood,” he stated at the end of his career, “that *communal re-creation* must include not merely the cumulative effect of accidental and partly conscious change made by many folk singers over a long period of time, but also sudden, marked and perfectly intentional changes by folk singers who are also folk composers, and have...retold an old ballad story in more or less new wording of their own.”

A number of Barry’s other contributions are at least as far reaching, and perhaps of greater significance. Fieldwork with singers stretched his understanding of the genre, and he daringly followed their lead in shaping both his conclusions and his methodology. His was a sophisticated understanding of structural and aesthetic aspects of folksinging. For him, folksongs were the union of text and air (the whole text and the whole melody), completely interdependent. Although Barry’s analysis of texts “actually outweighs his analysis of tunes” (Wilgus 1968), his pioneering discussion of traditional singing style and sets of tunes anticipated the great musicological treatments of folksong melodies published by the subsequent generation of folk-tune scholars. He insisted that other collectors search for tunes and treat them properly. Furthermore, he remained faithful to his early declaration that “to a folk-singer, words and music together make the ballad he sings. The one is not felt to exist without the other.”

As evidence accumulated, Barry saw ballad tradition as a mixture of old and new pieces, all subject to communal recreation. He edged toward including older popular pieces of known authorship into the rubric of folksong, stating boldly that whatever a folksinger sings “from memory” and “for the sheer joy of singing” is traditional. The idea was abhorrent to purists among his contemporaries, but Barry asked, “Why make a distinction when the folk makes none?” The effect of communal re-creation on such songs of commercial origin as “Casey Jones” supports his claim.

Just as prescient was his assertion, ventured in a discussion of Irish folksongs, of the “fact that folk-song is in reality an idea,” of which, by tracing its history, “we can get but the process of actualization.” This is a revolutionary shift in understanding the nature of a ballad. Elsewhere, he clarified his meaning: “No longer is a ballad a static narrative of an event or situation,” but it is a “process...one by which a simple event in human experience of subjective interest, narrated in simple language, set to a simple melody is progressively objectivated.” Barry also challenged the pervasive attitude that folk tradition is the product of illiteracy, pointing out that the printed ballad often stimulated tradition. He went so far as to claim “illiteracy” to be “a negative factor in ballad tradition...inhibit[ing] its survival,” thereby including the ballad printer among the folk engaged in re-creation.

Late in his life, Barry wrote of an “instinct” he had felt when he started collecting, “to go to the folk-singers...[for] evidence in solving the...problems of balladry.” It is entirely

possible that the incidence of a few folksongs in his own family's tradition gave him a glimmer of the process of transmission he later articulated, thus accounting for the intuition that more than thirty years later he reflected upon as "instinct."

Barry was a scrupulous editor who wrote in a style accessible to a general audience, and his mentorship of talented amateur collectors, some of whose work he greatly enhanced by outright collaboration, is also noteworthy. He shared his prodigious learning, introduced the resources of other scholars, provided models for documenting and archiving, and gave editorial guidance. A number of exceedingly well-edited midcentury New England collections of ballads and folksongs bear his stamp.

Barry mentored and collaborated extensively with Fannie Hardy Eckstorm and Mary W. Smyth in Maine and Helen Hartness Flanders in Vermont, among others. Eloise Hubbard Linscott paid him posthumous tribute in her *Folksongs of Old New England*, published in 1939. Of all New England collectors who were his contemporaries, only Edith Sturgis makes no mention of a significant debt of gratitude to Barry, and her *Songs from the Hills of Vermont* was a parochial effort unconnected to any ballad studies network.

A long interest in starting a separate professional American society for folksongs led Barry to found the Folk-Song Society of the Northeast. From 1930 on, he published the greater portion of his collections and commentary under its aegis in the *Bulletin of the Folk-Song Society of the Northeast*, which ceased publication at his death. (There is an annual of broader scope, *Northeast Folklore*, the publishing arm of the Northeast Folklore Society, which, in turn, was founded in the 1960s as a tribute to Phillips Barry by Edward M. Ives at the University of Maine, Orono.)

Bascom, William R. (1912–1981)

The leading American Africanist of his generation, specializing in art, folkloristics, and the Yoruba people of southeastern Nigeria. An early graduate student of Melville Jean Herskovits, Bascom shared his interest in the comparative study of religion, art, and folklore throughout Africa and its Diaspora. Beginning fieldwork in Nigeria in 1937, he learned the difficult tonal Yoruba language.

After wartime governmental research in Nigeria and Micronesia, Bascom and his Cuban-born wife, Berta, his lifelong coworker, began their studies of the Shango cult, *santeria*, and divination practices of Yoruba origin in Cuba and elsewhere in the New World. *Continuity and Change in Africa Cultures*, which he edited with Herskovits in 1959, is a reference text so popular that it has been reprinted eight times. In 1957 he left Northwestern University, Evanston, Ill., to become the founding director of the Lowie (now Phoebe A. Hearst) Museum of Anthropology at the University of California, Berkeley, where his brilliant exhibitions of African art produced several fine catalogs and a popular text. Continuing his interest in Yoruba religion first developed in his dissertation on cult groups, he produced the magisterial *Ifa Divination: Communication between Gods and Men in West Africa* in 1969, which won the Pitre Prize, plus follow-up studies on the Shango cult of the Yoruba god of thunder and lightning as it spread throughout the New World, and a parallel study of the spread of Ifa divination.

Although he described himself as “am anthropologist who does folklore,” Bascom’s contributions were invaluable in a number of papers showing the interplay between myth, narrative, and divination. His two addresses as president of the American Folklore Society, “Four Functions of Folklore” (1954) and “Verbal Art” (1955), along with other major papers displaying his outstanding skill in careful and clear description and analysis in preference to theory, were collected as *Contributions to Folkloristics* just after his death in 1981. He was interested in diffusion theory, as in his major survey article on “Folklore Research in Africa” published in the *Journal of American Folklore* in 1964, as well as in the aesthetics of narration, as shown in *African Dilemma Tales* (1975). Edited by Alan Dundes in 1992, his posthumous *African Folktales in the New World* is Bascom’s final triumphant blast in the decades-long battle with Richard M. Dorson, who held that he had never collected a tale of African origin from his many African American informants, only European, Native American, or Asian tales, and that “Anansi (the popular African trickster) fails to set foot in the United States.” Bascom published numerous tales unquestionably from Africa but told in the Americas, including Anansi stories from the United States. The book also brings up important and embarrassing questions about diffusion and independent invention so long unanswered that contemporary scholars simply eschew them.

Baseball

A form of “rounders”; America’s national game for nearly 150 years. Baseball is played formally and informally as “hardball,” “softball,” “stickball,” “wiffle ball,” “monkey move-up,” “one old cat,” and in dozens of other forms. Almost all Americans have played some version of it, watched it, and read about it, and most Americans are exposed to its lore and language more often than they realize. Baseball has also sunk deep roots in Japan and Latin America.

Baseball players are from disparate regional and ethnic backgrounds. They come together only for practices, games, and road trips, then go their separate ways. White, Black, Latino, they are literate and subject to the same popular culture that America at large shares. Moreover, they read the people who write about the game, and they talk to the people who broadcast it. Thus, they are not a clear-cut folk group, although they have a certain homogeneity, and an occupa-

tional lore has developed among and about them. This lore may be divided into three parts.

First is the lore brought to the game by the players from their varied backgrounds. This lore is drawn on as needed and, even if modified to fit the occupation, differs little from the same lore beyond the game. The number thirteen is unlucky on the diamond as at home. Second is the lore that grows up within the game itself. Dizzy Dean strolls over to the opposing dugout, asks each starter what pitch he prefers, then, throwing only the pitches requested, hurls a shutout. Third is the lore that sportswriters, radio and television personnel, and sometimes fans create about baseball, much of which filters back to the players. The proverb “Nice guys finish last,” erroneously attributed to Leo Durocher, is a case in point.

Because most ballplayers come from literate backgrounds, they have no need for the major forms of folk tradition: for religious stories like myths (they have their Christianity or Islam or odier religions), for songs, ballads, and love lyrics (they have radios, televisions, and cassette players), nor for full-blown legends chronicling the history of their cultures. What one finds, therefore, are anecdotal legends and jokes, proverbial lore, superstitions, and especially a vigorous body of folk speech.

Baseball’s most famous tale is about George Herman “Babe” Ruth, the true hero of the game. Supposedly, this superman, at the plate in the fourth inning of the third game of the 1932 World Series against star pitcher Charlie Root, had two strikes on him when he pointed to the centerfield stands and on the next pitch hit a home run to the exact spot indicated. Eyewitnesses agree that Ruth did raise his finger after the second strike, but Root insisted until he died that all Ruth was doing was illustrating his taunt: “You still need one more, kid!” Nevertheless, the “indicator home run” story is known wherever baseball is known and has pretty much hardened into fact. Ruth, who was by far the most charismatic player to play the game, is also the hero of numerous anecdotes: He drinks all night, then smashes three homers when hung over; he earns more than President Hoover and rationalizes it on the grounds that he had a better year than the “prez”; he eats and wenches in a fashion that would exhaust Hercules.

But there are other heroes and other tales. Rube Waddell loads the bases on purpose, calls in the outfield, and strikes out the side. Lefty Gomez comments on his fastball at the end of his career: “I’m throwing as hard as I ever did; they just aren’t getting there as fast.” Such anecdotes wander, attaching themselves to whatever hero is before the camera at the moment. Who was the player who hit one for the sick child? Who was the pitcher so mean he “low-bridged” his mother at a church softball game? Who was the batter thrown out of the game because he told the umpire he was sick, “...sick of bad calls”?

Many stories take the form of tall tales or outright jokes. Satchel Paige is known to throw so hard he can get strikeouts without releasing the ball: He simply winds up, the catcher slaps his glove, and the duped umpire yells “Strike!” the batter blinking in agreement. A dog runs onto the field and grabs a grounder, forcing Honus Wagner to pick up the animal and heave him to first for the out. Gaylord Perry throws an illegal spitball that is so loaded it sprays both the batter and the umpire.

Although baseball has developed a number of beliefs and superstitions—such as the seventh-inning stretch and the prohibition against telling a pitcher he has a no-hitter going—most such material is highly personal. Players who always cross a baseline right-foot-first, or who pick up every scrap of paper in the dugout, or who wear lucky clothes

and carry amulets are acting no differently than any human faced with a critical situation. Nor is most of this material unique to the game. The bad luck associated with a black cat, and the good luck associated with four-leaf clovers, the rabbit's foot, and not shaving on the day of a game, are superstitions known everywhere in America.

Baseball's proverbs and proverbial sayings are much more apt to rise from the occupation itself. Besides the famous "Nice guys finish last," there are true proverbs like "Don't pitch a country boy high" (Don't throw fastballs to a rookie), truisms like "Southpaws are crazy," conventional phrases like "Stick it in his ear," and popular comparisons like "Loose as a goose" or "Loosey goosey." Much of this material is part of the cant of the game and is a vital part of American speech. Even the least interested know the meaning of words and phrases like "rookie," "bench warmer," "rooter," "beanball," "southpaw," "bush-league," "pinch hit," "out in left field," or "out of my league," even if they have no idea of the meaning of a "can of corn" (easy fly ball), a "gopher ball" (a pitch a batter can "go for"), or a clothesline (line drive).

Sportswriters and announcers, mingling with the players, have been instrumental in spreading such folk-say. One of their efforts has resulted in the widely used malapropisms attributed to former catcher, coach, and manager Yogi Berra: "It's not over 'til it's over," "It's *déjà vu* all over again," and (at an event honoring him), "Thanks for making this night necessary." Some writers and announcers have had true literary talent or flair: Ring Lardner, Gilbert Patton, Edward Stratemeyer, Grantland Rice, Paul Gallico, Ernest Thayer, and James Thurber, to name a few. In magazines and newspapers, these men created an entire lore about the game. Tales of Lardner's Jack O'Keefe in *You Know Me, Al*; Pattons Frank Merriwell, Stratemeyer's Baseball Joe, Thayer's Casey of Mudville, and Thurber's midget in *You Could Look It Up* (which inspired Bill Veeck to send midget Eddie Gaedel to bat in a major league game) are as much a part of baseball's lore as stories about Ruth, Waddell, or Dean.

Basketmaking

An ancient traditional technique of shaping natural material into a container form. Using one of three methods—plaiting, weaving, or coiling—basket makers have created hundreds of shapes and sizes over the centuries. Their products, probably used in every society in the world, have functioned in myriad ways: as silos, sheds, vehicles, boats, furniture, garments, roofs, shoes, hats, targets, decorations, strainers, cradles, coffins, ceremonial objects, trays, houses, fans, creels, and tools. Baskets have been used as containers to hold such things as gourds, eggs, bottles, canes, weapons, milk, apples, mush, berries, water, money, cosmetics, and firewood.

Traditional basketry has been produced in every size, from tiny thimble cases to giant fish-storage baskets. The range of sizes and shapes is usually dictated by function, and the raw materials by ecology. Leaves, vines, and reeds are used in tropical areas, grasses and low-growing plants in arid regions, and split wood and bark in woodland areas.

In the Orient, elegance of design, attention to detail, and perfection of craftsmanship have produced some of the most exquisite baskets in existence. In Africa, where materials are plentiful and artful decoration is an accepted part of daily life, basketry has always been an important craft, and remains so today. There is still a Basketmakers' Guild in London, and traditional (though now usually poorly made) baskets have become a popular tourist item in Europe and elsewhere. Baskets made by Native Americans are known throughout the world for their diversity of design and technique, their beauty, and their ancient history (baskets discovered in Utah have been dated from 7,000 B.C.). Researchers believe that Native Americans had well over a hundred general and specific uses for basketry.

Among the colonists in the United States, traditional basketry began with simply importing European baskets and using indigenous versions. Those who later wove baskets for themselves and for sale followed their own native traditions (as they would with all of their folkways), adapting local materials where necessary. However, they often copied or modified the materials, forms, and techniques used by their neighbors as well (including Native Americans, other immigrants, and Africans).

Basketry was usually a "side" profession with American immigrants, since it lent itself so readily to a spare-time occupation. Some producers became established as professionals in a few sections of the country; and sometimes whole families kept a business going, taking wagonloads of baskets around the countryside to sell. Usually, however, output was reserved for family and near-neighbor consumption.

Several traditional American groups—religious, ethnic, racial, and regional—have been renowned for their basket artistry. The Shakers were justly famous for all of their fine products, among them an astounding variety of basket types. They manufactured quantities of baskets of sound construction and elegant simplicity that were sold outside the community in the early and mid-19th century. The Pennsylvania

“Dutch” (German) immigrants, who settled primarily in the southeastern portion of that state, continued to make their traditional baskets from coiled rye straw (sometimes wheat and oat straw as well), round willow rods, and flat oak splints. They produced a wide array of functional forms, made almost entirely by part-time workers, usually on winter evenings. African Americans living in the coastal regions, especially in South Carolina, made coiled sweet-grass baskets that closely resemble those produced in Africa. Baskets from the Southern Appalachian Highlands demonstrate a continuity in form, since ribbed baskets were and are their best-known type. Ash, oak, elm, maple, hickory, and various barks were used, though white oak became the prevalent wood used in that region and in

the Ozarks, along with young shoots of willow, a variety of vines, and other tough-fibered plant materials.

Finding and identifying baskets made today in a traditional manner and locating their makers is not easy, though it is possible with diligent research. In the case of old baskets, correlating them with their makers is virtually impossible. Basket makers almost never signed their works, nor did they keep records. City directories, Census records, and other standard historical documents seldom uncover basket weavers; they simply were not listed, since the craft was nearly always a side profession. House and farm inventories, store records, and oral tradition have been the most fruitful, albeit limited, sources for uncovering their history.

In the mid-19th century, machine-made baskets decimated a once thriving business in the United States, and younger men turned to other trades instead. (There are few reports of White women basket makers, only “helpers,” which may simply reflect a bias on the part of writers.) The Arts and Crafts movement in the 19th century helped avoid a total decline of craftsmanship during the Industrial Revolution. In the early 20th century, the Rural Handicrafts movement also came to the fore, supporting crafts as art, as recreation, and as a source of rural income, especially for residents of the Southern Appalachian Highlands. This type of activity was interrupted by World War II, and for several decades basket-making declined precipitously. More recently, with the wave of nostalgia for the “good old days,” along with a revolt against our society’s plastic, disposable lifestyle, basketmaking has experienced such a resurgence that the few remaining traditional weavers cannot meet increasing demand for their products.

Baskets had, of course, been a necessary adjunct to a number of important occupations, such as farming, fishing, hunting, the production of cheese, honey, and cotton, and the wood industries. They were used in numerous household activities and were popular gift items, too. But those early baskets were nearly all woven with function as the primary consideration. Recently, instead of being used only for functional purposes, baskets have acquired a new role as decorative objects. Contemporary artists utilize traditional techniques, but with a freedom from the constraints of the usual formdictated-by-function, which allows for innovative, artistic approaches. Still, for many who learned in the traditional way by example, either in a family or a community setting, there is little experimentation, and the old ways are considered the best (and also the best *sellers*).

Preparing the wood splints for plaiting and weaving is one of the most difficult aspects of basketmaking. It entails finding a tall, healthy tree, straight and relatively knot free (or other suitable, easier material), chopping it down, and then splitting it into sections. After the bark is removed, the wood, after being started with a knife, is pulled into long strips with the hands. The strips condnue to be pulled apart by hand, until they are the desired thinness.

At this point, those artisans making flat splints scrape and smooth the wood on their laps on a shaving horse, using a sharp knife. Those making round splints or rods (a rare technique today) have several more steps to perform. First they pull a one-fourth- to one-half-inch splint through a series of metal dies set into a board. The board is secured and the dies are filed sharp; as the splint is pulled through the die with pliers, it is neatly shaved. A rod of the desired diameter is achieved by pulling it through successively smaller holes.

There are three types of basket construction: plaiting, weaving, and coiling.

Plaiting consists of working flat materials in two opposite directions, interweaving them at right angles in either an over one/under one pattern, or an over two/under two pattern.

When *weaving*, the basket maker works warps or stakes, held together by wefts. In one type of weaving, wickerwork, a single weft is woven through the stakes; in twining, two or more wefts are twisted and locked around the stakes. Weaving can be done with either flat or round splints.

When constructing a plaited or woven basket, the maker constructs a bottom first. In plaiting, splints are laid out, usually on the floor or on a table, and then interwoven into a bottom of the desired shape. These splints are then bent up at each side and plaited in an over/under pattern with splints running at right angles to form the sides of the basket. A rim is bound on, and a handle is then inserted and lashed into place.

In weaving, the bottom resembles a spider web, with spokes radiating from a circular core. When using flat splints, those spokes are pulled or bent up to become uprights for the sides. When making round-rod baskets, new rods are inserted into the bottom and bent up for the stakes around which the weavers are manipulated.

Coiling consists of winding a round bundle of tightly gathered material—usually a type of grass or straw—into a spiral and sewing it together at regular intervals with a binder. The binder can be either a long strand from the bundle itself, or a different material altogether. Collecting materials for this method is less arduous than for the other two methods of basketry, since sweet grass, pine needles, palmetto, and rush, for example, are easier by far to harvest than trees.

A basket is begun by gathering and knotting a handful of central fiber into a bundle of the desired diameter (often one-fourth inch), then wrapping a portion tightly with a flexible binder. Turning the coil clockwise (usually), the maker forms a continuous spiral, using a needle or an awl to girdle the grass with one stitch, and then attach it to the preceding row with another. Shape is dictated by the placement of the subsequent coils in relation to those preceding them.

It must be emphasized that, as technical as a description becomes, it suggests only a few of the steps involved in these often arduous processes. As basket maker Dwight Stump of Hocking County, Ohio, admitted, sometimes the work becomes tedious. One day, chuckling, he commented:

At times I have a notion to quit. Like everything, it gets monotonous. Sometimes I have to stop and do something else, mebbe two, three months. Then I wonder how I'd go to make baskets, and I go back to makin' baskets again. Yeah, it's like an old basket maker used to tell me, "When you get in the Basket makers' Row once, it's hard to get out." I don't know why, it just kind of grows on a person. You get attached to it. (Joyce 1989)

Basque Americans

Immigrants (and their descendants) from the western Pyrenees and Cantabrian seacoast region of southern France and northern Spain. Long regarded as the quintessential shepherd of the American West, Basques entered the region as a part of the California gold rush. Many came from southern South America, where, by the early 1800s, Basques were heavily engaged in sheep husbandry on the pampas under frontier conditions. Thus, despite the common belief that Basques were transplanting a Pyrenean skill to the American West, the pattern of sheep transhumance that emerged throughout the region was based more upon a South American than a European model.

By the 1850s, some Basques, disillusioned with mining, had turned to sheep husbandry in southern California, either leasing land from the dons or moving to the edges of European settlement. The typical pattern was for a sheepman to send back to Europe for a kinsman or fellow villager who would work for him for a few years. The herder would take his wages in ewes, running them alongside those of his employer. Once his own band was sufficiently large to be self-supporting, he would head out in search of unoccupied range. By the turn of the century, Basques were present in the openrange districts of all thirteen Western states.

In their guise as itinerant sheepmen (“tramps” to their detractors), Basques were vilified as usurpers. Moving ceaselessly about the public lands, and with no possessions other than a pack animal, gear, dogs, and a sheep band, the itinerants, by their very existence, challenged the local arrangements of settled livestock ranchers (cattlemen and sheepmen alike). Technically, grazing was open to all on a first-come basis, though in reality the ranchers regarded the public lands adjacent to their holdings as their private domain. The tactics used to harass the itinerants varied from local legislation extending grazing rights one or two miles beyond private fence lines (subsequently declared unconstitutional), to intimidation and outright violence such as the destruction of a sheep camp, the shooting of the sheep, or the roping and dragging of the herder himself. Such confrontations lent litigation to the courts and copy to the newspapers.

Of greater significance was the itinerant sheepman’s role as a catalyst in the region’s land-use legislation. With creation of the national forests, newspaper headlines heralded “Sheepmen Get Basques Excluded.” In the first years after establishment of Yosemite National Park, it was necessary to use Army troops to patrol its precincts in order to keep itinerant Basque sheepmen off their traditional summer range. The desire to exclude the itinerants also informed legislation in the 1930s that ordered the remaining public lands into grazing districts, subsequently under the jurisdiction of the Bureau of Land Management (BLM). Whether regarding access to summer range in the national forests or winter range controlled by the BLM, livestock allotments were henceforth to be awarded solely to U.S. citizens, with commensurate deeded land and in consultation with advisory boards consisting of local ranchers. Exclusion of the itinerants could not have been more complete. Thus, in a negative sense, Basques may be regarded as key architects of the land-use policies on the public domain of the American West.

Restrictive immigration policies enacted by the U.S. Congress in the 1920s limited Basque immigration. Based upon a national-origins quota, after 1924 only 131 Spaniards were to be admitted annually and most of Europe's Basques resided in Spain. By World War II, most of the Basque herders had either died, retired, or returned to Europe. The manpower shortage of the war years exacerbated the labor crisis in the sheep industry. Consequently, a pattern emerged in which Basques contrived to reach an American port, jump ship, and make their way to a sheep ranch. The rancher then lobbied his congressman to introduce special legislation legalizing the herder's status as an emergency measure. Through these so-called Shepherd Laws, 383 Basques were accorded permanent residency.

The practice was both cumbersome and inadequate. In 1950 Senator Patrick McCarran of Nevada, an ex-sheepman, framed legislation to facilitate the recruitment and introduction of Basque sheepherders into the United States. The sheepmen formed the Western Range Association to facilitate the program. Between 1950 and the 1970s, several thousand Basques worked in the American West on three-year herding contracts (designed specifically to prevent them from qualifying for permanent residency, which would enable them to abandon herding). By the 1970s, sheep numbers on the open range were plummeting due to greater restrictions in response to budding environmentalism and trends in the world mar-

ket for sheep products. At the same time as Europe's postwar economy improved, Basques became unwilling to work for the relatively low sheepherder wages. The Western Range Association redirected its recruitment efforts toward Latin America. By

the mid-1990s, there were only a few hundred sheepherders left in the American West, and they were much more likely to be Mexican, Peruvian, or Chilean than Basque.

Throughout their nearly century and a half in the American West, the Basque immigrants were more sojourners than settlers. Few, if any, of the young men who left the Pyrenees came with the intention of remaining either in herding or in this country. Rather, their idea was always to make a stake and return to Europe to retire a farm mortgage, purchase a property, or start a small business. However, in each cohort of immigrants a few changed their minds, buying or homesteading a ranch property or possibly establishing a small business in town.

The demographic profile of Basque immigration (dominated by young, single males) and the seasonality of the labor demand within the sheep industry (roughly half of the herders were laid off after the lambs were shipped in the fall and two summer bands were combined into a single winter one) favored establishment of Basque boarding houses throughout the open-range districts of the American West. With the spread of the transcontinental railroad and its branches, the typical Basque "hotel" was situated close to the train station. Newly arrived immigrants, met at the dock in New York City by a representative of Valentin Aguirre's *Casa Vizcaína* hotel and then sent westward with their destination pinned on their lapels, would descend wide-eyed from the train anxious to spot the promised ethnic haven.

For the herder, the hotel was an address, a place to store his town clothes when out on the range, and his rifle, saddle, and gear when on a visit back to his homeland. Each hotel was a part of a wider intelligence network regarding job opportunities (usually, though not exclusively, in the sheep industry) and therefore served as an employment agency. The hotel was a base of operations for the vacationing herder out for a fling on the town. It was a convalescent home for an injured herder; a retirement home for the family-less one.

The hotel keeper, usually an ex-herder himself, was translator, banker, confidant, and even father figure for his clients. Rather unwittingly, he also held the key to the formation of the Basque American community. He required kitchen and domestic help and activated his ties in the old country to bring over single women for service. In the single-male atmosphere of the Basque hotel, few of the women remained unattached for long. Thus, each hotel provided a tiny, if steady, trickle of women who married men prepared to abandon herding (since the occupation was inimical to family formation) and settle down. Others sent back or went back to Europe for brides. In short, out of each cohort of the intending sojourners a few changed their minds and became permanent settlers in the American West. Over time, there came to be a few dozen or even hundred Basques in each of the regions open-range districts.

For the Basque Americans, the hotels were the center of social life as well. It was there that they practiced their language, learned about the Basque country, and shared an occasional meal with the boarders, served family style at a common table. It was there that on weekends they joined the herders in dancing the *jota* to the strains of an accordion. It was there that more than one Basque American woman met her future spouse, thereby extending a pattern of endogamy into the second generation of the Basque American experience. In short, for Old World Basques and Basque Americans alike, the Basque hotel was the key ethnic institution, indeed practically the only one until the second half of the 20th century.

By the 1950s, there were the faint stirrings of Basque American ethnic pride. In 1949 Boise Basques formed a club, Euskaldunak, Inc. (Basques, Inc.), and in 1951 they built a clubhouse in the downtown area that functions to this day. In 1957 Robert Laxalt published his book *Sweet Promised Land*, the story of his father's life as a sheepman in Nevada and California and his return visit to his natal village. The work was widely read and critically acclaimed, instantly providing the Basque Americans with their literary spokesman.

In 1959 a Sparks, Nevada, casino operator, married to an Idaho Basque, decided to sponsor a national Basque festival. The venue proved fortuitous, since western Nevada was the one part of the American West where the largely Bizkaian population of eastern Oregon, southern Idaho, and northern Nevada overlapped with the mainly French and Navarrese Basque populations of California, eastern Nevada, Utah, Colorado, Wyoming, and Montana. The organizing committee embraced the spectrum of European Basque regional distinctions and bridged the Old World/New World-born generational gap as well. The hundreds of letters Laxalt had received from Basque Americans throughout the American West, thanking him for depicting their family's saga by describing his own, served as the vital link for bringing together the heretofore isolated fragments of what ultimately became a Basque American community of regional scope.

The first festival was an "invention" in the sense that its organizers combined certain Old World and New World elements into a pastiche unlike anything previously celebrated on either side of the Atlantic. In the process, they established a model that continues to be emulated.

In the aftermath of the first festival, Basque clubs proliferated in California, Nevada, and Idaho, most founded to sponsor a folk-dance group and to organize a local festival. Today there is a Basque festival cycle that is truly a movable feast, weekend-long celebrations that begin in late spring and shift venues throughout the region until late summer. Each festival likely entails a public dance, possibly a Basquelanguage mass, given by an ambulatory Basque chaplain, performances by the local club's dance group in folk costume (and possibly one or more visiting ones as well), athletic contests (stone lifting, woodchopping, weight carrying and tug-of-war), possibly sheep dog trials and a sheep-hooking contest, and a Western-style barbecue featuring lamb, "Basque beans," sourdough bread, and copious amounts of red wine.

Thus, like many other hyphenated Americans, by the 1960s and 1970s Basques were engaged in public display of their heritage. In this regard, they were a part of the broader "roots" phenomenon, though not to be confused with "ethnic revival," since Basque Americans were developing unique forms of group expression rather than reviving previously forsaken ones.

The wider public's interest in the Basques was furthered by several factors. There was the aura surrounding them as Europe's mystery people, a prehistoric group of undetermined origin speaking a language unrelated to any other human tongue. There was their shepherding legacy with its appeal to a world grown weary with urban malaise and easily seduced by the imagery of the stoic figure leading a life of splendid isolation amidst the spectacular setting of Western deserts and mountains. Consequently, the Basque shepherd and his colorful descendants of the rural West became the popular subjects of film documentaries, articles, and newspaper stories.

The creation of Basque American culture was furthered by the establishment, in 1967, of a Basque studies program at the University of Nevada, Reno. Its Basque Book Series, published through the University of Nevada Press, provided additional substance to Basque American identity. The program sponsored summer and year-long study courses in the Basque country, attended by many Basque Americans who returned to assume leadership roles within their local Basque club or dance group. In 1972 several clubs formed North American Basque Organizations, Inc. (NABO), an overarching structure that facilitates contacts both among its members and with Europe.

Under NABO's auspices, Basque Americans hold periodic summer music camps where children are taught to play the traditional *txistu* (flute). NABO sponsors national *mus* (a card game) and *pelota* (handball) tournaments and sends its representative to international competitions. NABO has also facilitated the North American tours of European Basque performing artists (dance groups, singers and *bertsolariak*, or versifiers). NABO has twenty-six member clubs, located mainly in California, Nevada, and Idaho.

At the closing of the 20th century, then, there are many manifestations of Basque American culture. The Basque hotels, some of which evolved into dinner rather than boarding houses, are popular eating places for Basque Americans and non-Basques alike. They, in turn, have made Basque cuisine famous throughout the region (as well as an alcoholic beverage called the Picon Punch). Associational life among Basque Americans has never been more robust. The annual festival cycle attracts thousands of participants and considerable media coverage, and it has converted the Basques (somewhat ironically) into one of the region's highest-profiled ethnic groups. Sporadically, there are even more impressive happenings such as the jai Aldi cultural festival sponsored in 1990 by Boise Basques. It included several days of film, lectures, and performances (including some by European artists) and attracted about ten thousand participants.

At the same time, as with all immigrant cultures, questions cloud the future prospects of the Basque American experience. In August 1989, on a hillside near Reno, Nevada, 2,500 people gathered to dedicate the National Monument to the Basque Shepherd. The sculpture itself is an abstract, rather than figurative, rendering of a herder carrying a lamb. The instant controversy that it engendered among Basque Americans is itself evidence of the dilemma facing the group. Continued Basque immigration from Europe has been all but interdicted, the sheep industry is faltering, as is the occupational association of Basques with it, and fewer Basque Americans retain their ancestral tongue or seek Basque marriage partners. Thus, the survival of the group is at issue as well as the real substance of the response of the 47,956 persons who self-identified as Basque ethnics in the 1990 U.S. Census.

And what were the tangible marks left upon the physical and cultural landscapes of the American West by the presence of the Basque shepherd? Not surprisingly, the traces are faint. Given the lack of fully formed family units in the Basque immigrant experience, which would have provided mature repositories and carriers of Old World Basque culture, it is scarcely surprising that the descendants of those who departed Europe as single young males or females have essentially had to create Basque American cultural reality in the New World context. Consequently, the attempts to collect among Basque Americans folksongs, stories, sayings, medicinal practices, religious beliefs, and the like have turned up fragmentary evidence at best—and then largely from Old World-born

informants. Similarly, Basques have left practically no architectural evidence, whether domestic or religious, of their presence. Rather, visible display of ethnic identity is essentially restricted to the family escutcheon, a wood carving of an Old World motif and a few books on Basque topics displayed in one's living room.

Perhaps fittingly, the real evidence of the region's Basque presence is to be found in the mountains. There the herders built ovens for their bread making and erected stone cairns, *harri-mutillak*, or "stone boys" in their language, both to wile away the boredom-filled hours and to humanize an unremittingly natural landscape. It is also there that the herders converted groves of aspens into veritable living galleries and mes-sage banks of images and statements.

Referred to technically as dendroglyphs, the tree carvings document the inner thoughts of men thrust into a situation of near total social isolation in a foreign land. Thus, there are the nostalgic images of the farmhouse or village church back home, the pining verse dedicated to the girl left behind, or the patriotic statement regarding one's region *Viva Navarra* or Basque nationalism *Gora Euskadi*. There are the complaints about one's boss or the neighboring herder over the hill. There are the pornographic images of nubile women and *crise de coeur* of sexual frustration. Finally, there is the simple record of a man's name and the date, which convey his presence to future herders. Such were the graphic means employed by the Basque herder to countermand the human fear of total anonymity.

Bassett, Fletcher S. (1847–1893)

Moving force behind the Chicago Folk-Lore Society. Bassett was born in Adams County, Kentucky, the year after the word “folklore” was coined, and was initially a military man, running away from home during the Civil War to enlist in the 108th Illinois Volunteers. He later enrolled in the U.S. Naval Academy and, after graduation, spent thirteen years in naval service. In 1882 ill health forced him into retirement, and he then moved to Chicago and devoted the remainder of his life to private scholarship.

Bassett’s *Legends and Superstitions of the Sea and of Sailors* [1885] 1971, was a disappointing work, almost totally secondhand, although the topic is one that he knew firsthand. The book received enough favorable publicity to justify a second edition in 1892, but it has no real bearing on Bassett’s status in folklore. His reputation rests mainly on his organizational abilities, specifically his key role in founding the Chicago Folk-Lore Society (CFS). The inaugural meeting of this organization was held on December 12, 1891, and it soon became popular both as an agency for the collection of regional data and as a philosophical and organizational alternative to the American Folklore Society (AFS). For a brief period, the Chicago society was a formidable rival to the older society, but with Bassett’s death on October 19, 1893, the Chicago Folk-Lore Society soon lost steam, and it passed into oblivion in 1904. It did bring about the establishment of a fund to award an annual Chicago Folklore Prize, which continues to the present.

The two societies were at odds over the question of whether the study of folklore properly belonged to the field of anthropology or literature. The AFS opted for the anthropology side, while the CFS chose the literary view. Bassett and William Wells Newell, the American Folklore Society’s intellectual leader, clashed over the International Folklore Congress of 1893 that Bassett organized. Held at the Columbian Exposition in Chicago, it did bring folklore much favorable publicity by showcasing many important scholars from around the world. At the same time, the anthropological meeting supported by Newell was a failure. This small victory, however, was the Chicago Folk-Lore Society’s last hurrah.

Bassett was in one sense a good organizer because he successfully brought together a large number of people to form an organization. In another sense, though, he was a poor organizer because he dominated the Chicago Folk-Lore Society so completely that after his death the association was leaderless. He also failed by recruiting a membership that was mainly made up of dilettantes.

Baughman, Ernest Warren (1916–1990)

Folklorist and professor of American and British folklore and American literature. Baughman was a Fellow of the American Folklore Society and a collector of Southwestern folktales, legends, jokes, rhymes, proverbs, and superstitions.

Born in Manson, Iowa, September 10, 1916, Baughman received his B.A. from Ball State Teachers College in Muncie, Indiana, in 1938, started teaching and collecting local folklore in Muncie, in 1939, and received his M.A. from the University of Chicago that same year. From 1942 to 1948, he continued graduate studies at Indiana University under Stith Thompson and served as a teaching assistant and later instructor. He received his doctoral degree in folklore in 1953 when he finished his dissertation. It was published in 1966 as *A Type and Motif Index of the Folktales of England and North America* (Indiana University Folklore Series No. 20) and was Baughman's greatest academic achievement.

In addition to his massive *Index*, Baughman published short articles and reviews in journals, including the *Journal of American Folklore*, *Midwest Folklore*, *Western Folklore*, *Southern Folklore Quarterly*, *New Mexico Historical Quarterly*, and the *New Mexico Folklore Record*, which he edited off and on from 1952 to 1979. He also did the scholarly annotations for Vance Randolph's *Sticks in the Knapsack and Other Ozark Folktales* (1958), and contributed annotations for Herbert Halpert's *Folktales of the New Jersey Pines* (1973) and Randolph's *Pissing in the Snow* (1976), the latter a controversial collection of bawdy tales from the Ozarks. Baughman also did significant work in American literature, publishing in 1967 a notable article in *New England Quarterly*, "Public Confession and the Scarlet Letter," that was reprinted in the Norton Critical Edition of *The Scarlet Letter* in 1978.

Baughman served as president of the New Mexico Folklore Society in 1957 and was named to the New Mexico Folklore Society Roll of Honor in 1976. Throughout his professional career, he served on various committees on the executive board of the American Folklore Society (AFS), and he was named an AFS Fellow in 1971.

During his career at the University of New Mexico, Baughman collected over 2,000 tales and 20,000 3x5 index cards from students that recorded riddles, rhymes, proverbs, superstitions, jokes, and legends. This collection, more than ten cubic feet of printed material, is housed in the Special Collections Department of Zimmermann Library at the University of New Mexico. An avid fisherman, summertime resident of Telluride, Colorado, and renowned humorist, Baughman was considered by many in the field as a helpful and thorough colleague who practiced collection, indexing, and annotation in the traditional form of scholarly folklore research.

Beck, Earl Clifton (1891–1977)

Collector of Michigan lumberjack songs. Nebraska-born Beck began studying Michigan lumberjacks in the 1930s. He collected their songs, stories, and dances through the 1940s, urging the seventy- and eighty-year-old former lumber workers to let him collect and publish the material before it disappeared. Beck taught English and folklore at Central Michigan University, where he also chaired the English department. In addition to his passion for teaching, Beck's love was collecting songs in the woods. He once described his fieldwork as "high adventure," adding that "it has given me unforgettable experiences, vigorous days in the out of doors, and some most interesting friends." He compiled various portions of the collection in three books, *Songs of the Michigan Lumberjacks* (1942), *Lore of the Lumbercamp* (1948), and *they Knew Paul Bunyan* (1956), all published by the University of Michigan Press.

Beck was as much a promoter and educator as he was a field collector. Not content simply to write books, he pursued numerous opportunities to present his informants and their traditions to public audiences. The group he helped form—The Michigan Lumberjacks—first performed at the 1934 National Folk Festival in St. Louis. Beck acted as their manager and toured with the Lumberjacks around the state and nation over the next twenty years, appearing at trade shows and school assemblies and even on national radio broadcasts. In 1959, when the Library of Congress produced the recording *Songs of the Michigan Lumberjacks*, Beck edited the liner notes.

Beck was a founding member of the Michigan Folklore Society, president of the Michigan Education Association, and vice president of the Michigan Academy of Science, Arts, and Letters. After retiring from Central Michigan University in 1958, he traveled extensively, occasionally performing lumberjack-song programs. He published a book of memoirs—*It Was This Way*—in 1963. In 1989, he was posthumously awarded a Michigan Heritage Award.

LuAnne Gaykowski Kozma

Beckwith, Martha Warren (1871–1959)

Anthropologist and folklorist who played a major role in the compilation and analysis of Hawaiian mythology. In addition, she conducted important research on American Indians (Mandan, Hidatsa, and Oglala), Jamaicans, Portuguese residents of Goa, regional folklore in the United States (Dutchess County folklore; folklore of college students), and African Americans. Beckwith served as president of the American Folklore Society from 1932 to 1933.

Born January 19, 1871, in Wellesley Heights, Massachusetts, she spent much of her childhood in the Hawaiian Islands, primarily the island of Maui. She earned her B.A. in English from Mount Holyoke College, taught literature for many years, and did not begin her formal training in anthropology and folklore until she was in her mid-thirties. She

earned her Ph.D. in anthropology under Franz Boas at Columbia University in 1918. Beckwith was appointed research professor of the Folklore Foundation at Vassar College in 1920 and remained in that position until her retirement from Vassar in 1938.

An indefatigable fieldworker, she made numerous trips to Jamaica between 1919 and 1922. In the summer of 1926, Beckwith gathered folktales at the Pine Ridge Indian Reservation in South Dakota, and in 1927 she worked among Portuguese settlers in India. Her primary contributions are her long-term studies of Hawaiian creation chants and myths and her many useful translations of Kepelino, Kamakau, and other 19th-century Hawaiians whose writings described the later period of the Hawaiian monarchy. Her classic study *Hawaiian Mythology*, representing more than thirty years of exhaustive research, was not published until 1940. In addition to her research on Hawaii, she also conducted pioneering work in the field of Hawaiian ethnobotany and ethnopharmacology. She spent the last years of her life collecting and classifying Hawaiian herbal remedies.

The publication of *Black Roadways: A Study of Jamaican Folklife* in 1929 was the culmination of a series of notable papers on Jamaican folklore that included analyses of proverbs, children's games, Christmas Mumming, and animal stories. The book received a number of favorable reviews, including an extended review in 1930 by Melville Jean Herskovits in the *Journal of American Folklore* (43:332–338), which praised *Black Roadways* as “the first ethnographic study of the life of any New World Negro which, to my knowledge, has been attempted.” In his review, Herskovits took Beckwith to task for what he saw as her inadequate attention to individual behavior and for ignoring variation within Jamaican culture. Nevertheless, he concluded that *Black Roadways* is a landmark study that provides a firm foundation for future research.

References evidencing Beckwith's keen interest in Gaelic literature and Celtic folklore appear throughout her publications. Trained in both anthropology and English literature, Beckwith attempted to bridge the gap between these two disciplines and met with considerable success. An example of an article combining the methods of literature and folklore is her 1924 essay “The English Ballad in Jamaica: A Note upon the Origins of the Ballad Forms,” which appeared in *Publications of the Modern Language Association* (39:455–483). Beckwith died on January 28, 1959, at the age of eighty-eight. She is buried on Maui.

Belden, Henry Marvin (1865–1954)

Ballad and song scholar, editor, and teacher. Belden was born in Wilton, Connecticut, into an old New England family of modest means. He graduated from Trinity College in Hartford, Connecticut, and taught at a private training school for West Point candidates until a small inheritance from his grandmother enabled him to begin graduate work in English at Johns Hopkins University in 1889. In 1893 he spent a year at the University of Nebraska, where he met Louise Pound, who became a lifelong friend and ally in ballad scholarship. After a year at the University of Strassburg to complete his thesis, he received his doctorate, and in 1895 he accepted a position at the University of Missouri in Columbia, a place he had never heard of but where he was to spend the rest of his life.

In 1903 Belden learned from his students that traditional balladry and song, thought no longer extant by Francis James Child, flourished in Missouri, and the collection and study of song became his major interest. He organized the Missouri Folk-Lore Society in 1906, and in 1908 he spent a semester at the British Museum to study broadside ballads. His successful collecting in Missouri and enthusiastic reports of his findings at meetings and in German and American journals brought him to national attention, and he served as president of the American Folklore Society in 1910 and 1911. He spent 1916 and 1917 at Harvard University, working on his collection, and, believing it complete, he left a copy to be published by the American Folklore Society as part of the anticipated volume on Missouri folklore. World War I brought an end to plans for publication then and eventually to the Missouri Folk-Lore Society. Archer Taylor, then at Washington University in St. Louis, was elected secretary in Belden's place in 1920, but no further meetings were held. The long-time president and supporter of the society, Mary Alicia Owen, who was to provide the African American and Native American materials for the Missouri volume, died in 1934, and with her any hope for publication of a collection of Missouri folklore.

Although influenced to some extent by the scholarly views of his time, Belden was a pioneer in his study of broadside and Native American balladry, at first for clues to problems of ballad definition and origin, later because he became intrigued with tracing the songs and the events that inspired them. He was very early in recognizing the importance of collecting music with text and urged collectors to note data on the singer and his or her source for the song. He took part, with Louise Pound, in the "Ballad Wars," standing masterfully against Francis Barton Gummere's theory of communal origin. His *Ballads and Songs Collected by the Missouri Folk-Lore Society*, finally published in the University of Missouri Studies series in 1940, was widely praised for its scholarly notes and careful editing, but criticized, ironically, for not providing more music by a critic who was perhaps not aware of how early the songs had been collected.

Into his mid-eighties, Belden worked with Arthur Palmer Hudson to edit the ballad and folksong volumes of *The Frank C. Brown Collection of North Carolina Folklore*, published in 1952 when he was eighty-seven, bringing to the task an undiminished enthusiasm and energy in spite of failing eyesight.

Benedict, Ruth (1887–1948)

Anthropologist and folklorist. First a student of Elsie Clews Parsons at the New School for Social Research in New York City, Benedict went on to study with Franz Boas at Columbia University where she completed her doctorate in anthropology on “The Concept of the Guardian Spirit in North America.” Benedict brought to her work in the social sciences a background in the humanities. Her undergraduate degree from Vassar College in 1909 had been in literature. She remained throughout her life a poet, publishing under the pen name of Ann Singleton. Benedict was conscious of her dual approach to anthropology and folklore. In December 1947, she delivered an address as the outgoing president to the American Anthropological Association on “Anthropology and the Humanities,” in which she maintained that not only were the humanities compatible with the study of anthropology, they were necessary for the vitality of the discipline (Benedict 1948).

Benedict stressed the importance of studying a culture holistically, with folklore as a vital component. She is remembered primarily for *Patterns of Culture* (1934), in which she discussed individual cultures as “personality writ large.” In *Zuñi Mythology* (1935), Benedict undertook an intensive examination of a single body of myths and folktales from a culture where “folklore [was] a living and functioning culture trait.”

Benedict taught courses in folklore and anthropology at Columbia from 1926 until her death in 1948. From 1925 to 1939, she was editor of the *Journal of American Folklore*, and of the *Memoirs* of the American Folklore Society. She served as president of the American Ethnological Society (1927–1929), and of the American Anthropological Association (1946–1947). During World War II, Benedict worked for the Office of War Information, where she began her research on Japanese national character that resulted in *The Chrysanthemum and the Sword* (1946).

Berea College

Private liberal arts college founded by abolitionists in Kentucky in 1855. Berea College makes use of folk culture in addressing the intellectual, social, and spiritual needs of the people of America's Southern Highlands. Christianity provides the unifying belief at Berea, and folk culture provides a basis for different people to collaborate with one another, each enriching the life of the other. There were also economic considerations in the founding of Berea College.

Early emphasis was on the handcrafts of America's Southern Highlands, from which the college takes 80 percent of its students. Weaving and woodworking were developed as student "industries" through which some students could earn their college expenses. Broomcraft, pottery, and wrought iron were added later, along with many other types of work opportunities. Enrollment is limited to those from low-income situations, no students pay tuition, and all students are required to contract for a labor assignment. The college even has a dean of labor.

A Homespun Fair, Appalachia's first craft fair and model for many others, ran concurrently with commencement in 1896 and is portrayed in a PWA (Public Works of Art)-sponsored mural by Frank Long in the Berea post office. The college became instrumental in marketing efforts and in the formation of the Southern Highland Handicraft Guild in 1928–1929 and the Kentucky Guild of Artists and Craftsmen in 1961.

Members of Berea College's Music Department took an early interest in ballads and regional music. Cecil Sharp (1859–1924), the English collector, visited the campus in 1916 and 1917 while collecting English ballads and folksongs in the United States. The Mountain Collection of the Hutchins Library at Berea College has extensive material on Appalachian music. Recent additions of sound archives of traditional music from field and commercial recordings and radio programs dating to the early days of country music are in the process of being made available to scholars and the public.

Interest in other folk arts, especially dance, developed in cooperation with the Council of Southern Mountain Workers and the University of Kentucky in a program that supported itinerant recreation leaders. In 1936 Berea College undertook full responsibility for Recreation Extension, and the Mountain Folk Festival was organized. Christmas Country Dance School was opened in 1938, and the Berea College Country Dancers, a performing troupe, was organized in the same year.

The college dancers feature Kentucky Set Running, a democratic, peasant, or "country" dance from 16th-century Britain. The dance was well preserved in eastern Kentucky and other Appalachian communities from whence it evolved into the American square dance.

Leonard Roberts, a 1939 graduate of Berea College, did pioneering work in contextual collecting of eastern Kentucky folktales, riddles, and songs. A robust craft industry has grown up in the city surrounding the college, and the State Legislature of the Commonwealth of Kentucky passed a joint resolution in 1988 designating Berea as the "folk arts and crafts capital of Kentucky."

Bigfoot

North American version of the traditional wild-man figure, named for the immense footprints it purportedly leaves. In Canada this creature is called Sasquatch, an anglicization of a Coast Salish Indian term. Stories of Bigfoot and its spoor are among the best-known belief legends on the continent, particularly in the Pacific Northwest among loggers and Native Americans.

While scattered reports of strange humanoid creatures and people who had “gone wild” in the woods have circulated since colonial times, it was not until the late 1950s that this legendary figure was routinely associated with a specific name and American region. Its origins are unclear but almost certainly stem from a fusion of ancient European wild-man traditions with Northwest Native American beliefs in hairy simian-like humanoids.

In the Northwest particularly, the creatures are described by Euro-Americans in rather mundane terms. All are said to be covered by hair, with a heavy build and ape-like face, and to emit an intolerable stench. Adults can be eight feet in height, while juveniles are much smaller; females often have large pendulous breasts. They have no speech, but communicate by grunts, whistles, and unearthly screams. They remain elusive through both their intelligence and their agility over rough terrain. At worst, they are only mischievous, never dangerous to humans, and are seen only because of their curiosity or sheer human good fortune. Sightings typically consist of people briefly seeing them at the edge of a forest clear-cut or running across a road. More recently, as the legend has extended to regions outside the Northwest (and receives attention through sensationalistic tabloid headlines, movies, television commercials, and the like), the creatures frequently are linked with UFOs and the world of the paranormal—magical associations that presumably allow them to survive undetected in more densely populated areas. The Northwest, however, is where the legend is most consistently manifested through periodic sightings and investigations of footprint discoveries. The creature’s purported existence is also acknowledged in several small tourist-oriented festivals in Northern California. Among loggers, Bigfoot is the subject of both jokes and serious discussion, depending on social contexts. Some loggers engage in the playful practice of fabricating realistic footprints in an attempt to deceive others and reinforce a sense of the forest’s potential for mystery.

The legend of Bigfoot has become popular during the recent ascendancy of environmental concerns and seems to reflect a reevaluation of humanity’s place in the natural world more than a fear of wildness. For loggers, the legend serves as a symbolic defense of their controversial livelihood, projecting into the future the continued existence of endless forests hiding elusive monsters. However, for Native Americans, with tribes as diverse as the Hopi, Lakota Sioux, and Cree experiencing periodic waves of Bigfoot sightings during times of social crisis, the legendary creature serves as a Pan-Indian being whose appearance represents a spiritual warning of the need for tribal unity and traditional values and beliefs.

Bikers

Persons whose individuality and social identity are in good measure expressed through motorcycle riding, modification, and decoration. In some senses, anyone who “rides” is a biker, but those who ride only occasionally are motorcycle “owneroperators” or “enthusiasts” to those who understand a narrower, gender- and brand-chauvinistic notion that “a biker is a *guy* with a *Harley* who rides a *lot*” Bikers ride as often as they can and express an aesthetic of “the ride” through dress and bike modification or decoration; through customary ways of being on the road, at the track, and in parked array; and through participation in large ritualized gatherings—rallies and races, rides, or runs.

Men and women who ride are harassed by media-maintained images of bikers as rough, raunchy, paunchy, boozy males covered with hair and “tatts” (tattoos), dressed in worn denim, weathered leathers, and glinting chains, astride large, loud (typically Harley-Davidson) cycles, roaring two abreast along highways in packs of a dozen or more—mavericks, at best, or dangerous, unsavory misfits. Male bikers, members of clubs whose “colors” and “attitude” (club insignia and demeanor) purposefully resemble those of “outlaw” organizations like the Hell’s Angels, Pagans, Banditos, and the Family *are* the reference for this “citizen” or “straight” nonrider image of bikers. This outlaw persona of bikers developed in the United States since the 1940s, fertilized by film images like *The Wild One* (1953) featuring Marlon Brando and Lee Marvin in Stanley Kramer’s portrayal of bikers as reckless, rebellious threats to ordinary folks, inspired by the 1947 “riot” during the Hollister, California, Independence Day motorcycle races, when the Booze Fighters rampaged the town, then posed for *Life* magazine photographs. In biker legend, “Hollister” is the genesis for the outlaw image and for the “one percenter” designation, worn as a jacket patch (“1%”) by outlaw bikers, distinguishing them from the other ninety-nine percent of law-abiding motorcyclists—members of the national Motor Maids Inc. or a chapter of Women on Wheels (WOW), members of Stoney Lonesome MC in Columbus, Indiana; the Orphans MC in Lemoyne, Pennsylvania; the BMW Rim Riders of Arizona in Scottsdale; the Copper Kettle Soul Riders in eastern North Carolina, or the Idontknow MC in Central Islip, New York. In 1994, *American Motorcyclist* reported that six million persons in the United States owned motorcycles and 200,000 were members of the seventy-year-old American Motorcyclist Association.

Within the majority, bikers continue a process of esoteric discrimination that conflates cycle brands, engine types, models and production years, factors for vehicle modification, regularity of use, length and level of the biker’s experience, a biker’s affiliation with a motorcycle group, and the biker’s gender. Some bikers distinguish “American-made” (Harley-Davidson) and “import” (Japanese manufacture) motorcycles, derisively termed “rice-burners.” Harley bikers joke about pranking an “import” owner by throwing a handful of rice under the cycle, and telling the other biker, “Hey, you got a leak.” Conversely, Harleys are called “John Deeres” or “tractors” by bikers who characteristically ride hunched forward in racing posture astride brightly colored “crotch rockets,” aerodynamically snub-nosed and all fairing. “Harley owners wear black

leathers, so the oil won't show" is a snide reference to a purported tendency for Harleys to leak, and aspersions concerning Harleys' unreliability are various—a Harley road repair kit needs only "a hammer and a pickup truck with tie downs."

Bikers dress for safety and comfort, but also for theater. Leathers, helmets, face guards, and boots protect from cold, wind, flying debris, and contact with the road—"going down" or "dropping the bike." Leather or denim vests and jackets are bedecked with souvenir patches or pins commemorating specific rallies and runs, and memorial patches for bikers killed in collisions with automobiles. An affiliated biker will "fly" the club "colors" on a vest or jacket back—an embroidered symbol emblem centered between curved "rockers" that name the club (top rocker) and the club's location (bottom rocker). The Christian Motorcyclists Association center patch shows praying hands at the base of a cross, and the rockers read, "Riding For" (top) "The Son" (bottom). Though not members, a few women fly the colors of fraternal clubs with additional appliqués declaring them to be "Property of..." some male member whose biker name—like "Nub" or "Jake"—completes the "property tag" message. T-shirts abound, naming biker clubs or far-flung bars, dealerships, rides, or rallies the wearer has visited. Helmets reflect biker attitudes toward their compulsory use; they are the smallest "token" helmet the law will allow; they bear sticker messages—"Let Those Who Ride Decide" or "Helmet Laws Suck"; and, for festive occasions, imaginative parody helmets appear for slow-ride parade wear—aluminum colanders and stew pots; "Visigoth" helmets widi fur and horns. A Harley "shovelhead" owner wears a shovel blade fixed to his visor cap; and owners of Indian motorcycles may wear full feather war bonnets.

Bikers identify with their motorcycles in various ways. They individualize engine performance or body styling through "chopping," "customizing," or "trick" work, and they sometimes refer to themselves and others by their "rides"—"I'm the '48 panhead chopper," or "He's the '88 Softail." Motorcycle paint decorations are like biker tattoos: they follow the contours of the cycle body—gas tank, fenders, luggage pods—and are self-conscious, symbolic expressions of the individual biker's "attitude." Individualized motifs and murals are configured by traditional patterns: (1) symbols of death and violence (skulls, stilettos dripping blood, Vietnam combat helicopters above the legend "A Great Day to Die"), speed and power (flames, lightning bolts), magic and fantasy (bearded sorcerers, dragons), femininity and nature (pink ribbon bows, peacock feathers, bees, hummingbirds, and flowers), machismo and nature (nude cartoon women, eagles, snakes, a Native American brave in loincloth, bareback on his horse, solemnly scanning a desert vista above the legend "The Last Ride"); (2) portraits of persons as significant to the biker as his or her cycle, such as first-born sons and wives; and (3) legends alone—"Loud Pipes Save Lives," "Live to Ride-Ride to Live." "Rat bikes," a perverse alternative in the mode of cycle as identity extension, are often oil caked and corroded, assembled from mismatched parts, with elaborate use of coat hanger wire and steel alloy cans for patch; rat bikes may also be decorated with assemblages of found objects—antlers, turtle shells, jingle bells, pieces of vintage Chevy, raccoon tails, shopping carts, and whatever.

Bikers find companionship and safety in numbers; solo riders are most vulnerable to being stranded by cycle malfunction or being "downed" in accidents caused by automobile drivers. If a touring "full dresser," weighing hundreds of pounds, breaks down or that biker goes down, more than one person is needed to turn it "rubber side down, shiny side up" and push the machine to a sheltering overpass. Where possible,

cyclists ride two abreast to force passing automobiles to use the adjacent lane and to make themselves more visible, day or night. Or bikers do road runs in staggered single file for their own visibility and, again, to encourage car and truck drivers to pass without crowding. Bikers greet each other on the road with customary gestures, rather than horn noises—a subdued right hand “thumbs up,” a raised right fist, a modest helmet bob and hand wave, or a flamboyant, “tall in the saddle” turning wave. Bikers set their cycles to go when they park, in paramilitary closed ranks, all leaned into the same kickstand angles, facing the exit route. Customary parking renders individual motorcycles less vulnerable to damage from automobiles and signals biker group identification and control. In any parked array, “bike looking” is expected and managed by protocol—avoid coming within two feet of a bike whose owner is not standing next to it; never lean over a bike, lest studs or chains accidentally scratch; point, but never touch, lest a ring or wrist zipper cause harm, or a concealed razor blade purposely cut a wire; and speak only admiring words—never bad mouth: “People know their faults; you comment on the good things; it’s etiquette.”

Local communities of bikers draw together for holiday and theme runs, often with charity fund-raising as “license” to assemble and ride in large numbers. A HOG (Harley Owners Group) Strut or Honda Hoot features brand-bike trophy shows; a Poker Run or Carnival Run involves a series of stops along a route at which bikers draw cards for poker hands or play carney games of chance; a Toy Run is a parade of bikers with assorted large pink plush elephants, archery sets, Raggedy Ann ‘n’ Andy dolls, and bright plastic ride toys bungeed to their bikes, riding two abreast through town, often with police escorts giving bikers right of way by blocking automobile traffic at intersections. Biker day events or week-long rallies involve competitive cycle shows, stunt or skill driving or racing events, and games—the helmet toss, plank ride, weenie bite. Regional events draw 6,000 bikers to such as the Golden Aspen Rally in Ruidoso, New Mexico. A weekend of treacherous ice- and snow-covered-mountain road riding is the reason for the Elephant Ride in the Colorado Rockies in February. Since the 1950s, the Black Hills Motorcycle Rally in Sturgis, South Dakota, and Daytona, Florida, Bike Week have become national gatherings, attended by more than 50,000 (motorcycles)—event counts are important; bikes are tallied first, then people.

Biker festivals as large as Sturgis or Daytona, or as significant to the local biker community as the annual Saturdaybefore-ThanksgivingToy Run in Greenville, North Carolina, give context for understanding the attraction to motorcycling that biker folklife artistic forms provide, and some of the reason bikers spend so much time on and with their cycles and with others who ride. Diversity and individuality are important to bikers, tolerance and camaraderie are necessarily complementary, but, in the end, the ride is most important, as a Texas biker with fifty-two years experience pointed out during one Golden Aspen Rally: “I did 100,000 [miles] last year, and this motorcycle’s not a year old and it’s got 75,308. I ride a motorcycle every chance I get. Fresh air, in the wind, the people—that’s why I ride.”

Billy the Kid (1859–1881)

The American West's most famous outlaw. Gaining notoriety as a vigilante in New Mexico, William H. Bonney (his bestknown alias) became a legend in his own lifetime thanks to embroidered stories in the *Potice Gazette* and dime novels. After his death at the hands of Pat Garrett, the legend evolved until he became not the sour rebel of the lawman's recollection but a friend to the poor and a romantic charmer. The "good bad man" gloss, introduced by Walter Noble Burns ([1926] 1973), was sustained in popular fiction, radio and

*Billy the Kid, with carbine. Library of
Congress.*

television treatments, and dozens of Hollywood serials and feature films.

According to Garrett, Billy was born in New York City, moved West with his family as a child, killed a man for insulting his mother when he was twelve, and murdered twenty more before he died—one for every year of his life. Scholars today believe that his given name was Henry McCarty and that the body count of his victims was greatly exaggerated. Well documented is his part in the 1870s Lincoln County, New Mexico, range feud between cattleman John Chisum and Lawrence Murphy. As a Chisum “regulator,” Billy apparently killed the murderers of Chisum’s ally John Tunstall as well as a Murphy sheriff, William Brady; engaged in two major shootouts with rival gunmen; and took his pay for services rendered in rustled cattle. Surrendering in hope of a pardon, he spent two brief spells in jail but escaped both times, gunning down another two lawmen in his second flight. Sheriff Pat Garrett finally cornered him near Fort Sumner, New Mexico and shot him to death from cover of darkness at a friend’s ranch.

The Kid’s legend was variously elaborated over time. For a generation after Garrett’s 1882 biography, he was the embodiment of violent disorder, a social evil that only violence could subdue. In the 1920s and 1930s, a more **ambivalent** figure emerged, as Americans used to bootleg gin and bread lines evinced a “mixed response” to a “loss of faith in traditional explanations” (Tatum 1982:90). By the postwar era, as shown in Arthur Penn’s film *The Left-Handed Gun* (1957), the Kid became a reflection of social malaise, “an alienated, troubled youth” pitted tragically against “regimented middle class society” (Tatum 1982:133). Through these changes, heroic motifs continued to resonate. His mysterious birth, his touted affection for the oppressed, and his death at the hands of a faithless friend made the outlaw a Southwestern model of the mythical victim. The mythical parallels fed stories, told into the 1940s, that he had magically survived Garrett’s ambush and was still alive.

Hollywood treatments of the legend, in addition to Penn’s film, included King Vidor’s *Billy the Kid* (1930), Howard Hughes’ *The Outlaw* (1943), Marlon Brando’s *One-Eyed Jacks* (1961), and Sam Peckinpah’s *Sam Garrett and Billy the Kid* (1973). The score for the Peckinpah film featured Bob Dylan’s country-style dirge “Knockin’ on Heaven’s Door,” a late addition to a body of musical elegies that included “Bilito” corridos as well as English-language ballads.

Birders

Persons whose hobby is to identify and study birds in nature, usually with the aid of optical equipment. North American birders number in the millions, making birding as popular as hunting or fishing. Birders interact via cultural forms incorporating speech and nonverbal utterances, narratives, customs, ritual, dress, tools, and technology.

Until the early decades of this century, birders were more likely to “collect” specimens by shooting in order to identify birds “in the hand.” The availability of high-quality optics and improvement in methods and guides for field identification have transformed birders from shooters to sighters. “A bird in the bush is worth two in the hand” is a purposeful parody, and was the motto of *Bird-Lore*, the first journal of the National Audubon Society. Landmarks in the history of bloodless birding include the 1900 founding of the Christmas Bird Count by Frank M. Chapman, the 1934 publication of Roger Tory Peterson’s *A Field Guide to the Birds*, the 1968 establishment of the American Birding Association, and the 1984 advent of the World Series of Birding, a fund-raising birdathon, sponsored by the New Jersey Audubon Society.

North Americans use “birder” and “birding” more likely than “bird-watcher” and “bird-watching,” and examples of usage include: “Where did you bird fall migration?” “Have you birded Attu?” and “I’m birding Churchill in June.” More particularly, one might go “owling,” “hawking,” or on a “rail romp,” depending on the “target” species; “wire-birding” is done while birders are driving. Identifying a bird by “jizz,” a composite of features such as general impression, size, and shape, is possible only by skilled birders who can, for instance, “call” birds at great distance, distinguishing a male “Coop” (Cooper’s Hawk) from a female “Sharpie” (Sharp-Shinned Hawk) in an autumn sky of migrating raptors. “Pishing,” done by birders of all levels of expertise, is onomatopoeic of the sound made to flush birds from cover. The word might be used as in, “He pished up a Song,” meaning that a Song Sparrow flushed to investigate the pishing. In the field, birders often use abbreviated common names like “Buffy” for Buff-Breasted Sandpiper, “T.V.” for Turkey Vulture, and “Maggie” for Magnolia Warbler.

Most birders acknowledge the significance of the life list, a list of all species of birds identified by one person. “Life birds,” or “lifers,” are birds sought for inclusion on that list, and “hard-core listers” will travel great distances to gain sightings of species reported by the North American Rare Bird Alert, a subscription “hot line” information phone service operated by Houston’s Audubon Society. Any day’s birding might produce sightings of “nice” birds (good examples of species) or “good” birds (rare or difficult sightings for an area or season). Birds the birder is not able to identify qualify as “LBJs” (little brown jobs) or “LBBs” (little brown birds).

Birders dress functionally to protect themselves and their equipment from environmental conditions, such as tick bites, cold, rain, and salt spray. Each birder customizes outfits of preferred equipment and clothing, but general rules apply: Wear dull rather than bright colors; Wear nothing to flap in the wind or make noise as one moves. Certain birders also wear clothing and emblems to display their ornithophilic

interest: bird club or birder event T-shirts, multipocketed vests decorated with bird club and birding “hot spot” embroidered patches, and narrow-brimmed hats festooned with tiny bird pin souvenirs of American Birding Association conventions. Birders’ automobiles bear bird club window decals and bumper sticker messages of “Caution! Sudden Stops! We’re birdwatchers.” Custom license tags name a favorite or unusual species with perhaps abbreviated or coded spelling: ELF OWL, KISKA-D, HOOPOE, BLUJAY, MERLIN!, BL GRSB (Blue Grosbeak).

Birders operate within a hierarchy of expertise and preference that distinguishes “dickie birders” and backyard birders from hawk watchers and birders with life lists of North American sightings exceeding 600 or 700 species. Binoculars are ubiquitous among birders, and any birder also may use a tripod-mounted spotting scope for magnification at greater distances than “binocs” or “binos” will handle. Customarily, birders share scope views, and once a bird is “in the scope” the owner steps back and offers the view to others. Birding may be a solo or ensemble enterprise, but birders who “list” prefer to bird with at least one other person of equal expertise for sighting verifications. Custom is for a birder who has sighted a bird to “call” the identification for others’ benefit, naming at least species, sex, location or flight direction, and continue to call, until others “have” the sighting. Built into that custom is the expectation for accuracy, so those with the greatest expertise are likely to call first. Birders narrate their experiences and exchange information about “hot spots” (locations with avifaunal variety) and identification “tips,” the sharing based on a democratic sense of group identity. Birders greet by inquiring about each others’ sightings, and in these exchanges birders estimate the quality of sightings claimed based on unspoken, indirect evaluations of the claimant’s expertise.

Birders’ expressed values include conservation of birds and preservation and creation of habitats, cooperative sighting and continuous study, benign interruption of birds’ natural life, scrupulously honest and exquisitely detailed reporting. High competition is a feature of Big Day events, wherein birders compete to identify the greatest number of birds within twentyfour hours. Christmas Bird Counts are informally competitive for numbers of individual birds and species identifications as well as for numbers of participants and modes of transportation used to accomplish counts. The World Series of Birding involves sponsored teams competing in Big Day fashion for the highest number of species identified during this spring-migration event. Ceremonial closure at birder events is the “countdown,” wherein the checklist is read aloud and birders respond aloud, “yes” or “no,” for each species named, composing a corporate list. In the countdown, beginning or unsuccessful birders can share in the expertise of the assemblage, understanding the meaning of the birder proverb: “Even the worst day birding is the best day you’ll ever have.”

Birthdays

Annual celebrations of the anniversary of the date of someone's birth, sometimes marking significant points in the life cycle. Birthdays are celebrated most often in a family setting, but also at school and in the workplace. The birthdays of prominent citizens may be commemorated publicly in either an official or a casual ceremony, and the media often mention the birthdays of well-known people. Whatever the contexts for celebrating a birthday, in American tradition one expects to have a cake (or other special food) decorated with lighted candles (one for each year of the honoree's life), the singing of the birthday song, and (following the honoree's blowing out the candles) gifts from the guests.

Birthdays include the custom of associating certain gems with one's birthdate ("birthstones"), the lore of astrology, the sending of birthday cards, literary birthday references (such as Humpty Dumpty's "un-birthday present" in Lewis Carroll's *Through the Looking-Glass* [1872]), and national holidays associated with birthdays (President's Day and Christmas). There are also numerous folk beliefs and customs associated with birthdays, such as that "the best day to start a business is on your birthday," "a child that cries on its first birthday will have an unlucky life," and "if a slice of the birthday cake tips over on the plate, that person will never marry."

But the main focus of folkloristic investigation of American birthday celebrations is the birthday party itself, with its much varied routines involving cake, candles, song, and gifts. (At children's parties there is also usually a ritual spanking of the honoree and the playing of traditional games like "Pin the Tail on the Donkey") Family celebrations of birthdays usually begin at age one and may continue, more or less "complete," until the end of a person's life. Special emphasis tends to fall on the first birthday, the thirteenth (becoming a teenager), the sixteenth ("sweet sixteen"), the eighteenth (driving, drinking, and perhaps draft age), the twenty-first ("adulthood"), and the following decade years (especially the 40th). Often these milestones are marked by special foods, speeches, gifts, or even commemorative advertisements in the newspaper ("Lordy, Lordy!/Look who's forty!").

As the person grows older, the correct number of candles may be rationalized by using number-shaped candles, designating each candle as meaning five or ten, or spelling out the number with candles. Interpreting the ubiquitous candleblowing rite, Theodore Humphrey suggests, "The breath of the honoree becomes symbolic of the divine afflatus, the life-giving and sustaining force of the universe, and by breathing it over this culturally encoded symbolic food, the cake, the birthday honoree endows it with magic power." The standard "belief" is that the honoree makes a secret wish before blowing out the candles; if he or she extinguishes all of the candles in one puff, the wish will come true.

"Happy Birthday to You," the birthday song in English, was originally published in 1893 with the title "Good Morning to All"; it is probably the most frequently sung song in the United States, especially if one includes the common parodies sung by children

(such as, “Happy birthday to you/You live in the zoo...”). Other nations have their own traditional

songs, such as the Danish one that begins “*I dag er det (Jans) fødselsdag*” (Today is [Jan’s] birthday).

Birthday gifts (as well as cake decoration, a party theme, and the like) often reflect the occupation or hobby of the honoree. Gifts may also mark the life-cycle points (such as liquor for one who comes of age), and special attention is often paid to the fortieth birthday, which may have a “mourning” theme since the honoree is now “over the hill.” The typical celebration includes a black cake, funereal decor, and geriatric gifts.

(Remember, too, that Jack Benny never allowed himself to become more than thirty-nine years old.) Gift wrappings may or may not be saved for reuse, according to family custom, each unwrapped gift may be bumped on the honoree's head before being opened while a rhyme is recited ("Heavy, heavy hangs over your poor head..."), and possibly a wish is made for the giver.

Among the many other variations on, and additions to, the birthday routine practiced in American families are these: a "date with daddy" for the birthday girl; birthday parties held for pets or dolls; conference calls with absent family members, with everyone singing "Happy Birthday" together; butter put on the nose of the birthday person; kidnapping of the honoree for a birthday breakfast; surprise birthday parties; commemorative newspaper ads on the birthdays of deceased family members, and small items baked into the birthday cake that supposedly have divinatory significance.

Thus, birthdays inspire ceremonies that unite a family or a peer group—even if some members are separated by distance—in order to focus upon and honor the person who has reached one more year of age. The celebration may set up new relationships for a brief time (like "Queen" or "Boss" for the day), and birthdays are linked whenever possible with stages in the life cycle, especially leaving infancy, achieving maturity, and reaching middle age.

Black English

Pronunciations, vocabulary, and grammatical forms used primarily by African Americans; also known as *Vernacular Black English* or *African American Vernacular English* (AAVE). AAVE is primarily associated with lower- and working-class African American oral culture but may be used by speakers from any social level. Black English is not limited to particular age groups, though there are generational differences in the incidence of some features. Many African Americans never use AAVE, and others use it only in informal conversations with other African Americans. Some speakers use only a few features of AAVE, whereas others use most of them. Virtually all phonological and grammatical features of AAVE are used in other varieties of Southern speech, but they are used much more frequently by African Americans—evidence that AAVE developed alongside other varieties of English in the American South. With the migration of Southerners into industrial and urban centers after World War II, AAVE has expanded geographically, with urban varieties developing usage patterns that are noticeably different from those of more conservative rural varieties. Features originating in rural varieties of AAVE were caricatured in popular entertainment prior to the 1960s, and since the 1970s urban AAVE has frequently been used in television, popular music, and stand-up comedy.

When linguists began seriously studying AAVE in the 1960s (and popularized the term Black English), they noted similarities between the vernacular language of African Americans and pidgin and creole languages. Gullah, a regional dialect spoken on the coastal islands of South Carolina and Georgia where rural African Americans lived in relative isolation until the 1930s, has many characteristics in common with pidgins and creoles of West African origin, but the vernacular language of 20th-century African Americans in communities where there is social interaction among a broad range of Black and White cultural groups has much more in common with other varieties of Southern American English. Because the first generation of African Americans learned English as a second language, a substratum of West African phonological, grammatical, and lexical forms remained in African American English for several generations—just as a substratum of Germanic, Romance, or Slavic influence remained for several generations in the speech of immigrants from Europe. As successive generations of African Americans became further removed from African language and culture, and as they interacted more with Anglo Americans, African features declined in their speech.

AAVE is “r-less”; that is, *r* after a vowel is either not pronounced (homophones: *door* and *dough*) or is pronounced “uh” (homophones: *boa* and *bore*). The sounds spelled with *th* alternate among several pronunciations: the voiced fricative alternates with [d] and [v] (*that*, *dat*, *bruvuh*); the voiceless fricative alternates with [t] and [f] (*nothin!* *nut’nl nuffin*). Older speakers of Gullah and AAVE who had little contact with other dialects during their youths may never produce the “th” sounds with the tip of the tongue between the teeth. Other characteristics of AAVE include word-initial stress (PO-lice, IN-surance); elision of initial unstressed syllables (*remember* → *‘member*); special

pronunciations of certain words (*ask as axe; aunt with the vowel of dawn*); typical “Southern” pronunciation of the “long *i*” in *time as tahn* and use of an *ao* diphthong in *caught*; special meanings for certain words (*passed= “died”*); repetition of the subject in pronoun form (*My sister she like the color red*); frequent use of *ain’t* (*I ain’t got any*); and other nonstandard usages such as multiple negation and nonstandard verb forms (*It don’t make no difference*). All of these dialect features also occur in the folk speech of White Americans in the South.

The features of AAVE phonology that most differentiate it from other varieties of English are the lack of consonant combinations at the ends of words and the suppression of final consonants in general (*desk→dess; cold→cole→coe*). These features affect the inflectional system of the dialect. The regular plurals and possessives of nouns and the tense forms of regular verbs in standard English have final consonant combinations that are often truncated in AAVE (*her sister’s friends →her sister friend; he walks→he walk; it rained→it rain*). Some linguists have attributed these forms to pidgin or creole influences, implying that the lack of strongly articulated final consonants in AAVE derives from the fact that many of the languages of Africa have consonant combinations at the beginnings of words but few final consonants.

Salient in AAVE are special uses of verb forms, particularly the verb *be*. Where standard English may contract *is* and *are*, AAVE has no verb (*He drivin’ too fast; You right; but: I’m right; I know he is*). Other special verb forms that linguists have documented as being widespread in AAVE are “habitual *be*” (*He be doin’ that all the time*), “perfective *done*” (*He done lef’ already*), “remote-time *been*” (*I been finish that book*), and “double modals” (*We may can get together, but might can’t settle everything*). All of these structures except “completive *been*” and some combinations of double modals occasionally occur in the folk speech of many White speakers in the South. The use of AAVE rarely causes problems in understanding for Americans familiar with the dialect, but exclusive use of AAVE for personal communication adds to the challenges that young African Americans face in learning to write and speak standard language in school.

Urban varieties of AAVE have made substantial contributions to popular American vocabulary, from terms like *jazz, cool, and rap* to contemporary usages associated with urban gangs (such as *bad* meaning “good”). Urban AAVE is innovative in its vocabulary, but because of the negative stigma attached to AAVE most of these usages remain in the realm of slang.

Because language is a powerful social instrument, AAVE has proven to be useful to African American communities in maintaining group identity. Recent research has indicated that, rather than being reduced by the prevalence of mass communication and public education, the primary features of AAVE enjoy a vigorous life. African American stand-up comics and rap artists capitalize on AAVE pronunciations, grammatical forms, and expressions to evoke desired responses from their audiences, just as any verbal artist uses certain features of dialect to indicate social class, level of education, ethnicity, and rural versus urban origin.

Blacksmithing

A venerable folk technique for molding iron and steel. The blacksmith heats a selected piece of metal to an extremely high temperature on a forge (approximately 1,500°F) and then shapes it into his desired form by the force of repeated hammer blows as the metal is drawn across the surface of an anvil. For more than four millennia these three elements—fire, hammer, and anvil—have constituted the core of the blacksmith’s business even though the usual blacksmith shop is filled with hundreds of tools, including numerous types of tongs, punches, chisels, drills, and wrenches. Blacksmiths are so named because they work with iron, the so-called black metal; all other metal workers are then collectively referred to as “white smiths.”

The oldest known examples of worked iron, which date to about 2000 B.C. were found in the Near East. Blacksmithing spread so rapidly from the eastern Mediterranean that by 1000 B.C. the craft was well entrenched in central Europe as well as in Asia and Africa. During Europe’s Middle Ages, blacksmiths came to be recognized as the pivotal artisans among all of the skilled trades. They not only produced useful articles necessary for the efficient operation of every household such as cooking utensils and fireplace gear, but they also made the tools employed by all of the other craftsmen. They provided hammers, saws, and drill bits for carpenters, chisels for stone cutters, trowels for masons and plasterers. And when these tools became worn or were broken, they were brought back to the smithy to be mended. Farmers, of course, looked to local blacksmiths for plows, shovels, hoes, pitchforks, and other implements used to raise and process their crops. In maritime settings, smiths provided all manner of “boat iron” as well as chains, anchors, and fishing hooks. Land transpor-

tation might come to a halt without the assistance of blacksmiths, who could provide shoes for horses' hooves, iron tires for wooden wheels, and the gear needed to hitch animal teams to their wagons. Since the preindustrial era was the "age of iron," the blacksmith was necessarily an ubiquitous figure. Indeed, even now "Smith" remains the most common surname among people of English descent.

Given the fact that there is no evidence of iron working in North America before the arrival of European settlers, the American tradition for blacksmithing is clearly descended from Old World precedents. Indeed, the tools and techniques that American blacksmiths employ as well as the types of objects they produce differ very little from

European models. The sickle-like corn knives found in the Northeastern section of the United States, for example, derive from European shorthanded scydies. The lightweight swing plows that early pio-neers used to navigate around the tree stumps that littered their newly cleared fields, while often seen as evidence of homegrown American ingenuity, were based on a 16th-century English prototype that had its ultimate origins in Holland. In Pennsylvania, blacksmiths made strap hinges shaped in the form of rams' horns or cocks' heads and etched into them hearts, flowers, stars, and various geometric insignias. These bits of hardware were one of the means by which the highly decorative Germanic tradition in folk art was preserved. The Hispanic tradition for ironwork that flourished in the Southwest is seen in distinctive gear used by the horsemen who tended the cattle that were left to forage out in the open. The spurs and branding irons that are now regarded as standard features of the Old West and cowboy culture were actually imports from the Iberian Peninsula. Moving across the country, one finds finally very little in American blacksmithing that is uniquely American. Rather, as with much material folk culture in the United States, there is a diversity of expression. It is the plurality of blacksmithing traditions that is most emblematic of the American experience.

Gathered under the tide of blacksmith are several distinct metal trades: the farrier, who cares for horses' hooves and provides them with protective metal shoes; the wheelwright, who builds wooden wheels and fashions iron tires for their rims; the wainwright, who builds wagon bodies and equips them with the needed iron parts; the angle smith, who supplies structural iron for buildings; the toolmaker, who makes and repairs various metal implements; and the ornamental ironworker, who designs and builds decorative gates, fences, and window grills. In urban areas, an artisan might specialize in only one of these branches of ironwork, but the rural blacksmith could be called upon to perform all of these tasks. In the era before industrialization, a blacksmith was required to master several of the ironworking trades. But as more and more hardware was produced in factories, the demand for the blacksmith's skills was progressively reduced. Changes in our basic modes of transportation during the 20th century eliminated the need for most blacksmiths. With no horses to shoe or wagons to build or iron tires to repair, many artisans simply ended their careers. Others held on by turning to repair work. From being a creator or maker, these artisans became salvage or service craftsmen and often worked on broken car bodies.

The ornamental field, however, is one area of ironwork in which traditional smithing practices continue to thrive because factory production techniques cannot as yet successfully duplicate the effects of handwrought decoration. In the Charleston, South Carolina, area, for example, relatively young men carry on today under the watchful eye of Philip Simmons, an active octogenarian whose craftsmanship is rooted in a genealogy stretching back to the early 19th century (Vlach 1992). In Simmons' opinion, there is more than enough work in his city for four or five blacksmithing operations. During the late 1920s, when Simmons faced declining prospects for future employment, he took heart in the advice of his teacher who had told him, "Don't worry boy, there will always be work for a blacksmith." Turning to ornamental ironwork proved to be his salvation, and the steady flow of requests from local customers for gates and fences has allowed him to perpetuate his blacksmithing skills. But in the late 20th century, clearly the utilitarian dimensions of blacksmithing have been overshadowed by aesthetic motives as a craft tradition has been transformed primarily into a mode for artistic expression.

Bluegrass

A form of string-band and vocal music with strong ties to Southern folk music traditions. It emerged within country music in the 1940s. Embraced in the late 1950s by folk-music enthusiasts who saw it as modern Southern mountain folk music, it was the focus of a revival movement beginning in the mid-1960s that stimulated the rise of bluegrass festivals, clubs, magazines, and related businesses. Now well established as a music culture, bluegrass can be found in a range of contexts extending from full-time international commercial enterprise in the domain of popular culture to part-time local grass-roots involvement in the domain of folk culture.

Bluegrass takes its name from the band of its principal architect, Bill Monroe. A member of the influential Grand Ole Opry radio show on WSM in Nashville, Tennessee, since 1939, Kentuckian Monroe assembled a particularly influential version of his Blue Grass Boys in the years following World War II. It included mandolinist and tenor singer Monroe; guitarist and lead singer Lester Flatt, banjoist Earl Scruggs, fiddler Chubby Wise, and bassist Howard Watts (“Cedric Rainwater”). The copying of the instrumental and vocal styles, and the repertoire, of this band of self-accompanied vocalists initiated the development of bluegrass as a musical genre.

Today the music is perceived as the result of the intention of Monroe, and of those musicians who played with or emulated him, to modernize the Southeastern string-band folk-music traditions that were known as “old-time” music (although this term is used in other parts of North America to refer to many different local, regional, and ethnic folk traditions). The primary instruments—fiddle, guitar, five-string banjo, mandolin, and bass—as well as the repertoire and melodic structures of bluegrass reflect a continuity with this past. So does the strong insistence by bluegrass musicians that the instruments used be acoustic rather than electric. Modernization, then, occurred in the realm of what might best be termed “arrangement,” as bluegrass developed its own musical rules and traditions concerning the roles of individual musicians in producing its sounds. Considerable emphasis is placed in bluegrass vocals upon the singing of harmony parts, and a number of intricate patterns of harmonic arrangement have become accepted as part of the traditions of the music. Instruments are used to support vocals and provide musical interludes between periods of singing, as in many other contemporary popular forms. But the role of instruments in bluegrass reflects the high proportion of instrumental pieces in the repertoire and a concomitant expectation of instrumental virtuosity. This is accentuated by a stress on speed: Most bluegrass performances are at a brisk tempo that is particularly noticeable in those items of the repertoire that come from other music cultures. Also stressed is the choice of keys for singing that place the singers’ voices in high pitches. Bluegrass listeners often pay as much attention to the musical textures (high-pitched vocal harmonies, dense instrumental patterns) and the instrumental interludes in vocal pieces as to the words themselves.

The bluegrass repertoire has, in its general profile, remained remarkably constant. Newly composed pieces alternate with older songs taken from popular sources,

particularly country music, and from the oral traditions of the performers. Secular love and story songs (often with duet or trio refrains), gospel songs (generally sung by quartets), and instrumental pieces (usually featuring fiddle, banjo, and mandolin soloing in the jazz mode) all follow the same source patterns. While full-time professional groups are expected to create new and distinctive repertoires, the part-time followers of the music, who constitute the majority of those involved with it, typically perform a repertoire of songs and tunes based on the most popular items in the repertoires of the early influential bands—like “Foggy Mountain Breakdown” by Flatt and Scruggs, “Little Cabin Home on the Hill” by Bill Monroe, “Rank Strangers” by the Stanley Brothers, and “Love Please Come Home” by Reno and Smiley—and the many others more popular in recent times. As is frequently the case with folk traditions of many kinds, the origins and histories of specific items are often not known fully (if at all), and this information may not be considered very important. At the hundreds of annual bluegrass festivals and similar events, informal jam sessions attract as much attention as formal performances on stage. In these sessions, the familiar repertoire facilitates music making between both friends and strangers.

In its early years, bluegrass was most popular with rural working-class people from the southern Appalachians and other parts of the Upland South. Its popularity within the folk-music revival of the 1950s and 1960s attracted middleclass youth from outside that region. The bluegrass revival and the growth of festivals in the 1960s and 1970s broadened the audience still further. In the 1990s, bluegrass bands could be found in many parts of Europe and in Japan, New Zealand, and Australia. Like jazz, it is recognized as a musical genre that is characteristically American but also accessible to adventurous musicians from other cultures. And as with jazz and other established musical genres, it has developed its own politics of style, with various combinations of repertoire and performance practices described as “traditional,” “progressive,” “newgrass,” “new acoustic,” and so forth.

Until the late 1980s, all of the influential bluegrass musicians were men. By 1990 a growing number of influential women stars were altering that pattern, following the success of singer and fiddler Alison Krauss and her band Union Station. Although bluegrass repertoire and musical style reflect the influences of African American music, there are few Black bluegrass musicians.

Blues

Folksong and music genre highly influential in popular music. Blues first came to public notice around the beginning of the 20th century. The precise time and place cannot be identified, but its appearance is associated with a growing spirit of individualism in the African American community, especially in the generation born in the first decades of freedom. Early centers of the blues were rural and small town “juke joints” and house parties, country picnics, saloons, levee, lumber, and railroad camps, railroad stations, hobo jungles, parks and street corners, medicine, minstrel, and vaudeville shows, and urban “rent parties.”

The music’s core audience and its most prominent practitioners have been African Americans with a rural Southern background. Blues was especially popular in regions of new agricultural development, such as the Mississippi Delta, Louisiana’s Caddo Lake, and south Florida, among landless sharecroppers and migrant farm workers and among recent rural migrants to the Southern and Northern cities. The creation and performance of blues quickly became a means of making extra money and even a full-time living, and the music began to appear on the professional stage during the first decade of the 20th century, in sheet music during the next decade, and by 1920 on phonograph records. The music’s popularity spread to other segments of the African American community, to White Americans in the South and elsewhere, and eventually worldwide. Over the course of approximately 100 years, blues has persisted as a folk music, developed as a popular music, and exerted enormous influence on many other types of popular music.

It is difficult to offer a concise definition of the blues, yet certain prevalent characteristics can be noted. The most common verse form is the three-line stanza, in which the first line is repeated, followed by a final line that differs in content but rhymes. Sometimes a single line is sung three times or the final line does not rhyme, and there are two-line, four-line, and other forms as well. Usually each line is contained within four musical measures, so that the common three-line form occupies twelve measures (the so-called “twelve-bar blues”). The use of a musical instrument is integral to the blues, however, and it serves to punctuate and respond to the vocal lines. Thus, the voice is not heard throughout a blues performance, and there are phrases and sometimes whole choruses that are purely instrumental. A typical three-line blues stanza might run as follows:

Got the blues and can’t be satisfied (*instrumental response*)

Got the blues and can’t be satisfied...(*instrumental response*)

If I keep these blues, gonna catch a train and ride... (*instrumental response*)

In some folk blues, the performers play a series of instrumental “riffs” following the lines of verse. These are short repeated melodic-rhythmic phrases. Most male blues singers and most folk blues singers of both sexes play their own instrumental accompaniment,

usually a guitar, piano, or harmonica. Many female blues singers and some male singers of popular blues do not play an instrument. In some folk and many popular blues, the singer's instrument is supplemented by other instruments.

The scale of most blues differs from the Western diatonic scale in having a flexibility of pitch at certain steps of the scale, most notably the third and seventh and sometimes the fifth and other steps. Notes that are sounded within these flexible tonal ranges are commonly known as "blue notes," although they can be found in many other genres of African American folk and popular music besides blues. Blue notes can occur as microtonal variants of these scale steps within a single performance, as neutral pitches, as slides, as waverings, and as the simultaneous sounding of different variants of the scale step (such as major and minor). On instruments, blue notes can be achieved by "bending" techniques on the guitar and harmonica, by the "slide" guitar technique with the use of a bottleneck or knife, and by the rapid alternation or simultaneous playing of major and minor notes on the piano. In pentatonic tunes, blue notes are often especially prominent and lend these pieces a strongly non-Western character.

Most folk blues do not use harmonies more complex than the basic tonic, subdominant, and dominant chords and their variant seventh chords. Some folk blues, particularly those from Mississippi and adjacent states, have even less harmonic development or are entirely modal in character. Over the years, popular-music forms, such as jazz, have introduced more complex harmonies into blues, and these are especially apparent in many popular blues since the 1940s. Like most African American music, blues utilizes a full range of tonal qualities, both vocal and instrumental. Rough and smooth, percussive and melodic sounds are frequently mixed in the same performance, and the overall aesthetic of performers and audiences encourages this variety.

Most blues lyrics deal with the common events of everyday life, especially relations between men and women, from the purported point of view of the singer. They may or may not reflect the singer's actual life or feelings, but they generally represent a dramatic projection of these, so that the singer creates a larger-than-life persona during performance, even when singing the composition of someone else. The songs discuss human relationships in very frank terms, yet with colorful language, poetic imagery, and dramatic exaggeration. They describe and celebrate the temporary ups and downs of life, frequently juxtaposing themes of retention and rejection, staying (or returning) and leaving, praise and abuse, boasting and self-pity. Overall, they display an attitude of dissatisfaction with the status quo, with long-term relationships, or with permanent situations of any kind.

For singers and audiences, whose lives were often characterized by economic drudgery, limited mobility, and an ascribed social inferiority, blues offered an imaginative playground full of excitement, changes, and opportunities. Many blues singers and some members of their audiences have tried to make this playground a reality in their lives, in a limited, if not a full, sense. Besides relations between men and women, other prominent blues themes are travel, agricultural and industrial work, poverty and unemployment, sickness and death, alcohol and drugs, gambling, luck and magic, crime and punishment, and current events—either notable occurrences in the singer's life or regional or national events as they affect the singer and audience (for example, natural disasters, wars, government policies). While the term "blues" suggests songs

characterized by unremitting pathos, there is actually considerable humor and irony in blues lyrics, and the overall function of the music is cathartic and therapeutic for performers and audience. A number of blues songs reinforce a context of dance and celebration, and some are purely instrumental performances designed for virtuoso display or dance accompaniment.

As a new type of folk music, blues rapidly developed a large body of lyric phrases, verses, and couplets, melodic phrases and lines, and instrumental phrases and techniques that were shared by performers. Whole songs with their vocal and instrumental parts were not usually transmitted relatively intact, as in the case of ballads. Instead, performers fashioned blues by drawing from the common pool of lyric and musical elements. Sometimes a “core” combination of one or more verses, a melody, and an instrumental part would be transmitted, to which the singer would add further verses. Depending on their creativity and individual propensities, singers would introduce original elements into their blues songs. Even the same performer might vary a blues tune considerably from one performance to another, and some blues songs are unique combinations of the moment, either from traditional elements, or original material, or some blending of the two. The transmission of elements and exchange of ideas often occur in a local tradition, so that blues in a single community displays a certain commonality of content and style. Individual local traditions blend to

form regional traditions (such as Delta blues, Piedmont blues), and these in turn blend to form the overall folk-blues tradition. Crosscutting these relationships are the influence of popular blues and the mass media, particularly phonograph records, and the prestige of performers who become popular “stars” and songs that become “hits.” “Popularity affects blues by spreading songs and ideas quickly to many people over long distances, but also by freezing and canonizing certain songs, performances, and styles. Thus, the popularizing tendency simultaneously introduces creative and original elements to the tradition while serving to homogenize the tradition by excluding and reducing the prestige of less popular expressions.

The basic vocal material of folk blues is derived from the tradition of field hollers, a type of worksong sung by a solitary worker in the fields or in other occupations requiring

nonrhythmic manual labor. Chanted prayers and sermons may also have contributed to the style of blues singing, but they have less in common with blues in their lyric content than do the secular hollers. The flexibility and spontaneity of the hollers were given form by a variety of other folksong and folkmusic genres, particularly the folk ballad. By the 1890s, a three-line ballad form had come into existence in the African American community and among musicians working in a mixed Black-White environment. Many ballads utilizing this form were about characters who lived outside the law and organized society, such as “Stagolee,” “Frankie and Albert,” and “Railroad Bill.” These ballads were usually instrumentally accompanied in performance, and their form consisted of a rhymed couplet followed by a one-line refrain. This form was easily transformed to the common AAB verse structure of the blues. It is significant that the origins of the blues form incorporate a tension between songs associated with onerous work and songs about characters who defied the work ethic and did as they pleased. Other folk-music genres contributed to the blues as well; spirituals, group worksongs, and children’s songs were part of the general musical background to which most folk-blues singers were exposed.

Instrumental and instrumentally-accompanied music, such as folk ragtime, banjo and fiddle tunes, and fife and drum music, all contributed to the blues, particularly certain rhythmic patterns and the use of riffs. The folk-blues tradition is also a reservoir for many older folk musical instruments, such as a one-stringed zither using the slide technique, the onestring (or washtub) bass, the jug, kazoo, washboard, and spoons—all instruments derived from African prototypes, using American materials of construction or common household objects. In general, the stylistic, technical, and aesthetic features of the blues are predominantly African, while its formal features (such as strophic organization, three-chord harmony, and primary accompanying instruments) come from the European musical tradition. Its content, of course, reflects cultural patterning, individual creativity, and time, place, and events.

The popularization of blues began almost as soon as folk blues was created. Traveling professional and semiprofessional folk performers included increasing numbers of blues in their repertoires, and medicine show, tent show, and vaudeville performers incorporated them into their stage acts in the first decade of the 20th century. In the next decade, blues became popular on the Black vaudeville circuit, and songs were published in sheet-music form as early as 1912. Songs like W.C. Handy’s “Memphis Blues” (1912) and “St. Louis Blues” (1914) became national hits and for the first time gave White Americans outside of the South access to this music. In 1920 Mamie Smith became the first Black singer to make a blues record. Hundreds of records by her and other vaudeville-stage singers like Bessie Smith, Ma Rainey, and Ida Cox, were issued through the end of the 1920s and the demise of vaudeville. Most of these stage singers were women, usually accompanied by a pianist or a small jazz group. Meanwhile, beginning in 1926, large numbers of self-accompanied folkblues singers, mostly male, were recorded. Among these were guitarists Blind Lemon Jefferson, Blind Willie McTell, Tommy Johnson, Charlie Patton, and Memphis Minnie McCoy, and pianists Pine Top Smith and Roosevelt Sykes. Also recorded at this time were various duos, trios, and other small groups, such as jug bands, string bands, skiffle bands, and hokum bands. Many of the recordings of these folk-blues singers and combos were made on location in Southern cities, such as Atlanta, Memphis, and Dallas.

In the 1930s and up to World War II, recording activity was almost entirely concentrated in Chicago and New York, and only three companies accounted for the vast bulk of all record releases. A “star” system arose, particularly among resident Chicago blues artists, and performers like Big Bill Broonzy, Washboard Sam, and Tampa Red had hundreds of releases, often accompanying one another on records. The homogeneity that resulted was offset somewhat by the continued recording of new Southern folk-blues artists like Robert Johnson and Blind Boy Fuller. Another development of the 1930s was the addition to blues combos of typical jazz instruments, such as trumpet, clarinet, saxophone, and drums. By the 1940s, jazz and popular music influenced many blues singers. Some were known as blues “shouters,” such as Big Joe Turner, while others, like Charles Brown and Ivory Joe Hunter, were crooners

Many independent regional record companies sprang up in the late 1940s and early 1950s and recorded a variety of new types of blues. There was a brief upsurge of folk-blues recording activity, spurred largely by the novelty of the electric guitar and the creativity of artists such as John Lee Hooker and Lightnin’ Hopkins. Small electric urban blues bands were also recorded at this time, especially in Chicago under the leadership of such figures as Muddy Waters and Howlin’ Wolf. The most pervasive development of this period, however, was the creation of a new jazz-influenced electric lead guitar style. This style, which features the bending of strings, was pioneered by Texas guitarist T-Bone Walker and adapted further by B.B. King of Memphis. In the 1950s, gospel-influenced “soul” blues singing became popular, and the electric bass and organ were introduced.

In the 1960s, White performers began to define themselves as blues artists, reviving and adapting a range of styles from solo folk blues to electric blues bands. A blues revival of international proportions began, which has included the African American community, characterized by the rediscovery of older performers and the discovery of new ones, the development of a concert, festival, and club circuit, and the creation of blues societies, awards programs, fan and collector magazines, and newsletters.

In addition to having a history and development of its own, blues has influenced many other forms of popular music in the 20th century. The first commercially published blues was essentially a new type of multistrain ragtime music, whose innovations were the introduction of the three-line strain, a semblance of blue notes, and a greater seriousness in the lyrics. These traits, along with the improvisational quality of blues, would ultimately lead to the decline of ragtime. The blues form, blue notes, and improvisation were at the heart of early jazz and the performances of such jazz pioneers as King Oliver, Louis Armstrong, and Jelly Roll Morton. Swing bands, like those of Benny Goodman and Count Basie, relied heavily on blues, and in the 1940s blues was central to the music of innovative beboppers like Charlie Parker and Thelonious Monk as well as that of the Dixieland revivalists. Blues has been an important component of most jazz movements ever since.

Many of the innovative stars of country music, such as Jimmie Rodgers, Bill Monroe, and Hank Williams, learned directly from African American blues musicians. Rodgers in particular, often called the “Father of Country Music,” is best known for his blues with yodeling refrains. The “Father of Gospel Music,” Thomas A. Dorsey, was a successful blues composer and performer before he became prominent in gospel music in the 1930s. Blues helped introduce instrumental accompaniment, blue notes, and improvisation to

gospel music, and a number of prominent gospel artists, such as Roebuck “Pops” Staples, have had prior blues careers. Most of the early rock and roll hits of Elvis Presley, Chuck Berry, Little Richard, and others were blues songs. Blues continued to be an important part of rock music in the 1960s in the surf music of the Beach Boys, the sound of many British rock groups, psychedelic rock, and the “soul” music of artists like Ray Charles and James Brown. Blues has remained an important part of rock music in the “heavy metal” sound and has also entered many American ethnic traditions, including Midwestern polka music, Texas-Mexican *norteño* music, and Louisiana Cajun music. The Creoles of southwestern Louisiana have developed a special form of blues and blues-influenced music known as zydeco, featuring the accordion. Blues has also influenced the work of composers like George Gershwin, poets like Langston Hughes and Sterling Brown, and writers like Zora Neale Hurston.

Blues scholarship began shortly after the music was created and even before it took on a recognizable identity as “blues.” Early folklorists like Howard W.Odum and John Lomax made collections of blues in the South in the first and second decades of the 20th century. Because of the highly fluid nature of blues, they eschewed the comparative scholarship of the ballad collectors and concentrated their analysis instead on the blues lyrics as reflections of African American daily life and character. This sociological type of analysis has been continued in the writings of Paul Oliver on popular commercial blues. Musicians W.C.Handy and John Jacob Niles published collections of folk and popular blues in the 1920s, and blues was included in the collections of Negro folk music compiled by Dorothy Scarborough, Howard W.Odum and Guy Benton Johnson, and Newman Ivey White. Since the 1930s, significant collections of folk blues have been made by Zora Neale Hurston, Alan Lomax, Harry Oster, David Evans, William Ferris, and others. The historical and discographical study of popular blues was an outgrowth of jazz studies and has been carried on largely outside the discipline of folklore by researchers like Paul Oliver and Samuel Charters, who helped pioneer this approach in the 1940s and 1950s. Much of this work is centered on interviews and biographical portraits of artists who participated in the music’s commercial development. This work now accounts for the bulk of writing about blues. Cultural-contextual study of folk blues has been carried out by William Ferris, Alan Lomax, and others, while musicological and textual analysis of the workings of the folk-blues tradition has been done by Jeff Titon, David Evans, and Peter van der Merwe. Much of the blues scholarship in recent years has combined some of these approaches and interests.

Boas, Franz (1858–1942)

Anthropologist and folklorist. After receiving his doctorate in physics at Kiel, Germany, in 1881, Boas left for Baffinland, where he conducted fieldwork among the Eskimo (1883–1884). Through his fieldwork among the Tsimshian, Bella Coola, Tlingit, and Bella Bella, Boas came to view mythology, as he wrote in his diary, as “a useful tool for differentiating and judging the relationship of tribes” (Rohner 1966:159). In his work on folklore, Boas was concerned with an accurate recording of texts, and with an analysis of the texts either for linguistic purposes or for reconstruction of culture history through a study of the distribution of motifs. Boas’ interest in folklore was apparent from his earliest publication, “Sedna und die religiösen Herbstfeste” (1884), to *Chinook Texts* (1894), *Tsimshian Mythology* (1916), *Kutenai Tales* (1917), and *Kwakiutl Culture as Reflected in Mythology* (1935).

Boas exerted a critical influence on the organizational framework of anthropology and folklore through professional societies and the development of university and museum programs. In the course of his editorship (1908–1924), and that of his colleagues and students, Boas was able to exert influence on the tone, character, and content of the *Journal of American Folklore*. As Regna Darnell notes, Boas necessarily and “deliberately built up a counter power-bloc to the Bureau [of American Ethnology], in large part through the American Folklore Society and the American Ethnological Society” (Darnell 1969:875). Boas trained the first two generations of anthropologists and anthropological folklorists.

By establishing authority over university research and instruction in anthropology, and by maintaining control of the *Journal of American Folklore*, Boas brought to fulfillment his initial plan for folklore that he had formulated in the 1890s: that folklore should be kept under the wing of anthropology. The course set by Boas was changed in 1940, with the reorganization of the American Folklore Society, which was instituted to ensure a sharing of power between the literary and the anthropological folklorists.

Boas’ legacy to folklore studies lies in his advocacy of fieldwork and of recording and publishing texts in the native language, and in respect for the integrity and value of each individual culture.

Boast

Hyperbolic exaggeration used to impress listeners with the alleged superiority of the speaker. The boast or the brag is related to the tall tale because both forms depend upon exaggeration. Unlike the tall tale, the true boast lacks narrative elements. Typically, it hinges upon preposterous comparisons, outlandish exaggerations, and the flamboyant oratorical skills of the speaker. It is folk expression that allows speakers to impress all listeners with their alleged boldness, strength, and cunning. But seldom is the braggart taken seriously because of the boast's outrageous hyperbole. "I am a Mississippi snapping turde: have bears claws, alligators teedi, and the devil's tail; can whip any man, by G-d," brags one ringed-tailed roarer.

Boasting about physical strength and endurance appears in epic poetry as an obligatory part of the self-imaging that pugnacious heroes create about themselves. Primitive warriors such as Beowulf and chivalrous knights like Charlemagne boasted in lengthy speeches about their skills in combat. In the 19th-century United States, the heroic brag assumed comic dimensions. It found a suitable home along the frontier, where braggadocio reflected the young nation's expansive exuberance and self-confidence.

Travelers reported that colorful boasts and bragging duels were part of the social customs throughout the old Southwest, and these brags eventually became staples in popular literature of the day. Both Mike Fink and Davy Crockett became national heroes partly because of almanacs and newspapers stories written about them, and both allegedly were archetypal masters of brag. In the 1836 *Crockett Almanac*, Davy modestly proclaims: "I am a raal ringtailed roarer of a jaw breaker, from the thunder and lightning country, down east. I make my breakfast on stewed Yankee and pork steak, and by way of digestion, rinse them down with spike nails and epsom salts; I take dinner of roast goose, stuff'd with wild cats and onions; I sup on nothin but wind.... I can out-eat, out-drink, out-work, out-grin, out-snort, out-run, out-lift, out-sneeze, out-sleep, out-lie anything in the shape of a man or beast, from Maine to Louisiana" (quoted in Dorson 1977:xv-vi). And Mike bellows: "I'm a half wild horse and half cock-eyed alligator and the rest o' me is crooked snags an' red-hot snappin' turtle. I can hit like the fourth-proof lightnin' an' every lick I make in the woods lets in an acre o' sunshine. I can out-run, out-jump, out-shoot, out-brag, out-drink, an' out-fight rough-an'-tumble, no holts barred, ary man on both sides of the river from Pittsburgh to New Orleans an' back ag' in to St. Louiee" (quoted in Blair and Meine 1933:105-106).

Semantically, 19th-century boasts depend on imagery grounded in similes and metaphors shaped by life on the frontier. The emphasis is on masculine feats of courage and brute strength. Self-comparisons to forest and swamp animals such as alligators, snapping turtles, bears, raccoons, and snakes hardly outshine metaphors related to powerful natural phenomena including hurricanes, tornadoes, floods, and windstorms. In the brag, muscle and brawn outmatch brains and reason. Boastful proclamations are peppered with allusions to superhuman combats with gargantuan beasts, human and

otherwise. Rhetorically, most brags are structured around monosyllabic nouns and verbs that were exaggerated by compounds and strung together into bombastic flourishes. Authors trying to reproduce the nuances of frontier boasts were forced to use phonetic spellings and fractured grammar. Strategically, big talkers sought to entertain all bystanders and to outbrag all opponents with their quick wit and shocking comparisons. While boasts may exaggerate the truth, they are testimonies to the splendid imagination and verbal dexterity of these ring-tailed roarers. Few of these comic braggarts are ever asked to prove their rhetoric true.

The vernacularism of frontier speech and the longwinded loquacity of frontier and riverboat men attracted the attention of 19th-century writers. Easterners provided a ready market for a literature based on tall tales and brags, and American humorous literature was born. James K. Paulding, Augustus Baldwin Longstreet, Thomas Bangs Thorpe, and especially Mark Twain elevated the traditional oral boast to grandiose heights. Gradually, the comic boast in 19th-century literature lost its popular appeal as American literary tastes shifted away from the writings of local colorists.

But the boast has not diminished in oral tradition. Among young Black Americans, for example, "sounding" is a session of verbal boasting in which the participants, mouth-to-mouth as it were, try to better one another through their imaginative deployment of formulaic taunts and brags. In addition, modern rap and street-music lyrics, with their themes of sexual prowess and armed strength, popularize through commercial conduits the brag and reintroduce it to a whole new generation of urban Americans. In some folk contexts, brags sometime serve as invective taunts, and their abusive nature may lead to a fight. Barroom brawls may be preceded by verbal duels that consist of the protagonists hurling insults and brags at one another.

Bragging may also be found as a part of occupational lore, as when workers boast to naive bystanders about their particular on-the-job expertise. Researchers have shown that the lore of lumberjacks, cowboys, oil drillers, and smoke jumpers is rich with exaggerated boasts.

Boatbuilding

Traditional construction of watercraft, and the related folklore of vernacular boats. Boats are a conspicuous, highly significant class of artifacts in maritime communities. Because of this, traditional boatbuilding practices and associated traditions have been the focus of studies by folklorists and other cultural investigators. These studies, which generally deal with vernacular watercraft, frequently analyze how the design, construction, and use of boats reflect boatbuilders' responses to local environmental factors and requirements for work, recreation, transportation, and other functions. Some studies endeavor to chart cultural zones on the basis of the spatial distribution of boat construction techniques, designs, terminology, and other data.

Vernacular boats are cultural artifacts produced by craftsmen who follow the rules and techniques of local, often community-based boatbuilding traditions. Most traditional boatbuilders (invariably men) have learned their trade in an informal manner characterized by an emphasis on observation and imitation rather than verbal instruction. Typically, youngsters in maritime communities will watch their fathers or other men build boats and sometimes assist them with simple tasks. If their interest in boatbuilding remains strong, they acquire more advanced skills as they grow older. When opportunities are available, some become apprentices to established professional builders. Depending on local circumstances, having acquired the basic skills some build boats on a part-time basis while remaining engaged in one or more other economic activities either in their own shops or in the shops of other full-time activities, or become full-time boatbuilding specialists or professionals.

In general, the vernacular boat designs from which local builders choose are fairly limited. They usually consist of those that have been built and used in the area over the generations—that is, younger builders rely on the tested designs handed down to them by their predecessors. The basic elements of these designs are often preserved in the form of devices such as molds, templates, and half-hull models, along with traditional measurement formulas and other types of knowledge required to translate designs into actual boats. Over time, as they build more and more boats, builders sometimes add small improvements to the traditional designs. If these changes are deemed successful, they usually enter the local design canon and are passed along to subsequent generations of boatbuilders.

Innumerable examples of vernacular boat types can be found along the rivers, lakes, and seacoasts of North America and throughout the world. North American examples range from multipurpose aboriginal craft, such as Alaskan skin boats; to commercial fishing craft, such as the Maine lobster boat, the Lake Michigan fish tug, and the Northwest Coast bow picker; to recreational craft, such as the Southern jon boat, the Reelfoot Lake (Tennessee) stumpjumper, and the Rangeley (Maine) guide boat. Vernacular boats are of interest to folklorists because, like songs, stories, quilts, and other traditional expressive forms, they exhibit continual variation over time and space and reflect the values of the people who create and use them.

Early studies of the folklore of sailors, fishermen, and other maritime peoples tended to be more concerned with customs and beliefs associated with boats than with boats themselves and the details of their design, construction, and use. Beliefs thought to

invoke good or bad luck—many of which can still be found in maritime communities—have been especially well documented. These beliefs include taboos against whistling or uttering certain words on board; bringing certain people, animals, or objects aboard; beginning a voyage on a certain day; and painting a boat with certain colors. Beliefs about actions thought to bring good luck include using certain types of wood for specific boat parts, placing a silver dollar under a vessel's mast, launching a newly built boat according to a set ritual, placing statues of saints and other religious artifacts on board, and participating in blessing-of-the-fleet ceremonies. Early studies also considered the rich and unique nomenclature of boatbuilders, including regionally distinctive terms as well as those in widespread use.

Most studies explicitly about vernacular boats have concentrated on the materials and construction practices used to fashion them, along with their shapes or “lines.” The builder and his cultural milieu are generally of secondary concern. Consequently, boats are often analyzed from the writer's cultural perspective, not the perspective of the boat's builder; and their features are described with the standard terminology of naval architecture, not the terms used in the areas where the boats are built and used. One particularly influential practitioner of this approach was Howard I. Chapelle (1901–1975), a naval architect and maritime historian who was a curator of transportation at the Smithsonian Institution in Washington, DC. He authored many books on the design of American boats and ships, boatbuilding techniques, and regional boat types. In addition, he was a catalyst for the preservation of American watercraft. His book *American Small Sailing Craft* (1951) is especially noteworthy because it documents over 100 vernacular boat types, most located on the Atlantic and Gulf Coasts, between Maine and Texas. Based largely on Chapelle's own prodigious field research, the book presents a wealth of empirical data on the boats he describes, including line plans and tables of offsets that can be used to build actual boats. Still the only survey of such scope, *American Small Sailing Craft* established a model for persons interested in documenting North American vernacular watercraft and, to a certain extent, established a canon of vernacular boat types. Even more important, this book was instrumental in awakening interest in American vernacular boats.

Since at least 1970, there has been a movement to revive wooden boats in the United States that has emphasized the construction of many vernacular watercraft, including many documented by Chapelle, by amateur and professional builders. Other manifestations of this revival include the founding of small schools for the building of wooden boats, the establishment of small boatbuilding shops, and the organization of several annual wooden-boat festivals. The wooden-boat revival, which has analogues in other craft-revival movements, has received little scholarly attention.

Outside classic maritime communities—generally the most alluring research areas for folklorists—one can also find traditions associated with boatbuilding. Especially prominent are stories about amateurs' boatbuilding projects that did not work out as planned. Common themes include ambitious projects that were never finished, and projects that resulted in boats built in places (often a garage or a basement) from which they could be removed only by cutting a new opening in a wall. Another sort of tradition related to boatbuilding can be seen in a number of communities, situated on the banks of rivers, that have instituted river festivals and other local celebrations. Among other

activities, these events feature boat races involving competing teams rowing outandish vessels of their own design and construction.

In recent years, a small number of folklorists and other scholars have used an ethnographic approach for the study of vernacular boats. In essence, their work endeavors to document and analyze the intricacies of traditional watercraft design, construction, and use within regional cultural contexts. Relying heavily on interviews and observations in the field, these recent studies have investigated the meaning of boats from the perspectives of boatbuilders, boat users and other residents of maritime communities. Especially prominent in this approach is the assumption that, in order to understand the cultural significance of the vernacular boat, one must view it as part of a dynamic process and not as an isolated artifact.

Boatright, Mody Coggin (1896–1970)

Folklorist. A native Texan educated in Texas (B.A. from West Texas State Teachers College, M.A. and Ph.D. from the University of Texas), Mody Boatright spent his entire career in Texas as a teacher of English. After brief appointments at West Texas State Teachers College and Sul Ross State Teachers College, he became an instructor at the University of Texas in 1926; he retired from there forty-three years later, having served in all academic ranks and as department head. He served as secretary-editor of the Texas Folklore Society from 1943 to 1964, succeeding his friend and colleague J. Frank Dobie. He was elected a Fellow of both the American Folklore Society and of the Texas Folklore Society.

A lifetime spent in Texas did not make Boatright parochial or narrow in outlook, even though he focused his folklore research on Texas topics, including cowboys and pioneers (*Tall Tales from Texas Cow Camps* [1934] and *Folk Laughter on the American Frontier* [1949]). His most important work dealt with the folklore of oil prospecting and production (*Folklore of the Oil Industry* [1963], *Gib Morgan: Minstrel of the Oil Fields* [1945]), and with collaborator William A. Owens he wrote *Tales from the Derrick Floor* (1970), a pioneering piece of oral history. His best-known work, however, is his groundbreaking essay *The Family Saga* (1958), in which he defined and described this distinctive narrative genre.

Bodylore

Ways of thinking, speaking, and moving that embody cultural notions of personhood; the study of such corporeal dispositions and their symbolic import. The body, corporeality, embodiment, the self, thought, mind, and the relationships among them are construed differently in different cultures. Each culture engenders practices and discourses that encode its own understandings of what it is to be a body. Consider, in this vein, the nature of embodiment in American culture.

The American body is, from its inception, a cultural artifact, not a natural object. No brute, material, literal, physical, biological *given* precedes our conceptions of it. Experience of the body, and the conceptions that inform it, comes into being with embodiment. For instance, the body American that biomedicine invents is instantiated in its practices. No other more fundamental body lies beyond medical discourse. Rather, the medical body simply is the body as it is experienced in medicine (Young 1993).

The body is not merely culturally shaped; rather it takes shape, it comes into being, it materializes, within a culture. Beyond the discourses into which the body is inscribed—in which it takes shape and is experienced—is neither the Platonic form of the body nor its crude substance. The body is constituted by its discourses. The real body is not lurking behind the medical textualizations that humanize as well as dehumanize it (Ritchie 1993). The American body, the ethnic body, the gendered body, *my* body is *the* body. It might be clearer to think of multiple embodiments, shifts in the ontological status of the body, instead of hypothesizing a fundamental, essential, or prior body. The proliferating lore of the body investigated under the aegis of bodylore makes visible this cultural construction.

The term *bodylore* was coined by Katharine Young for the 1989 American Folklore Society meetings to position the body as a locus of inquiry in folklore. Bodylore condenses into one subfield an array of folkloristic interests in such corporeal matters as the uses of obscene-photocopy lore in American corporations (Roemer 1994); initiations, both sacred initiations into Cuban American *Santeria* (Mason 1994) and the profane initiations of the bachelor party (Williams 1994); issues of the flesh and the spirit with respect to the bodies of clergywomen (Lawless 1994); the sensual properties of Native American pots (Babcock 1994); kinaesthetic analysis of Hasidic body movement in a New York synagogue (Sklar 1994); American women's tattooing traditions (Attie, Monroe, and Wellner 1989); the analogy between President John F. Kennedy's corpse and the body of the king (Zelizer 1993); American quilts as corporeal discourses (Przybysz 1993); rituals of purification in American spas (Slyomovics 1993); and body metaphors in American folklore (Neustadt 1994). These inquiries are by no means new wrinkles. The body has been explicitly examined in American folklore in movement analysis, gender studies, gesture or body language, feminist theory, studies of ritual and taboo, cosmological systems, creation myths, clothing, food, manners, and elsewhere, and implicitly examined in studies of bodily practices from folk speech to the law. Bodylore puts forward as the central term of discourse a metaphysical idea that hovers in the background of these studies: the body.

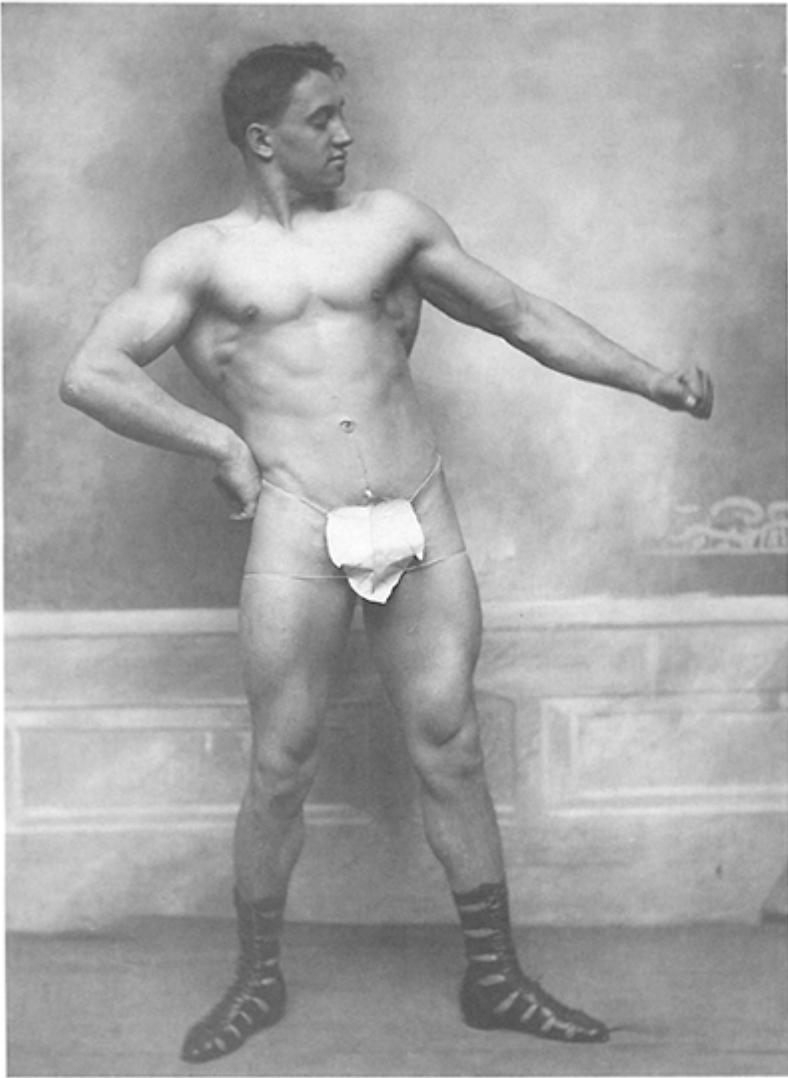

Close examination makes it clear that the body is not simply the inarticulate, uninflected, primordial ground of its discourses. The discourses invent the body. In American spas, for instance, the body is regarded as a continent object sealed off from the threat of contaminating influences by its skin (Slyomovics 1993). In European spas, by contrast, the skin is regarded as a pervious membrane through which benign influences pass into the body. The body in water appears as the incarnation of a cultural disposition. Likewise, consider the peculiarly American inflection of the king's body as the body politic given to Kennedy's corpse (Zelizer 1993). Over the course of its several examinations, the condition of the body is perceived to reflect the condition of the society. And American quilts, taken as the quintessence of femininity, have been reconstituted by feminist theorists as *écriture féminine*, in Helene Cixous' term, womens genres that carry the possibility of dismantling the category of the feminine (Przybysz 1993). Quilts materialize a shifting sense of the self in American culture.

Persons participate in multiple discourses and experience their bodies differently in each. Transferring from one discourse to another, in the gesture phenomenologists call realmshift, can entail a transformation of bodily state. In the traditional hazing on the eve of their weddings, American bachelors are obliged to experience their bodies as at once intensely sexualized and emasculated, so that they find themselves acutely aware of their corporeal selves at just the moment of their transformation (Williams 1994).

The body itself appears in different material densities in American culture. It may be solidified by medical discourse, the male gaze, or the bourgeois sensibility, each of which is concerned to construct the body as a kind of object in order to preserve, respectively, detachment, otherness, or propriety. This solidification of the body is not unique to these discourses. Medicine, for instance, is a condensation of our cultural drift toward the objectification of the body and its estrangement from the subject (Young 1993). We are all heir to Cartesian dualism. In other discourses, the metaphysical idea of the body may not have material instantiation. Spirit bodies, for instance, are etherealized enough to permit such New Age phenomena as astral projection—or, the self may be able to slough off the substance of the body, either transiently, in out-of-body experiences, or persistently, in the form of ghosts.

The obtrusiveness of the corporeal self is at issue with respect to the religious body in which spirituality, conceived as a rarification of the flesh, is set against sexuality, conceived as a manifestation of the flesh. This issue is especially acute in the face of the increasing ordination of American women, whose bodies are taken incorrigibly to obtrude their sexuality (Lawless 1994). Shifts in the material constitution of the body in these different discourses challenge any presumption of its inherent substantiality.

The body incorporates, corporealizes, culture. For that rea-

son, entering into a new discourse requires educating the body. Irritants in his ablutions make the initiate into *santeria* uncomfortably aware of his scalp just as he is about to receive an *oricha*, a deity who rules the head (Mason 1994). Bodily inscriptions attest to

this corporealization of culture. Literal inscriptions on the body's surface, body painting, tattoos, surgical incisions, and likewise their erasure through such practices as shaving, plucking, bleaching, or surgical excisions, literalize the sense in which culture is metaphorically inscribed on the body. The intent of face painting in American practice, for instance, appears to materialize the imaginary, to *make up* the face. Tattoos, supplements of the body as well as apertures into it, both exscribe and overwrite the inscription of culture on the body (Attie, Monroe, and Wellner 1989). Breaches of the boundaries of the body constitute transgressions. In a doubling of this transgressiveness, obscene-photocopy lore, itself an expression of what Mikhail Bakhtin calls the grotesque body, is deployed as an assault against the corporate body in which it is produced (Roemer 1994). Breaches of body taboos, by implication, locate the boundaries of the proper body.

But the body is not just inscribed into its discourses; it takes up its discourses. Gestures and postures modulate into attitudes and inclinations, at once the imprints of external pressures on the body and the expression of internal states out of the body. Immersing oneself bodily in the practices of Hasidic Jews provides us intelligence of a corporeal kind about the nature of the religious life (Sklar 1994). The rhythms of ritual may arouse emotion in the body or emotion may transpire as a body rhythm. From the outside, the body appears as a perceptible object; from the inside, as an experiential locus. Body image is composed at the intersection between visual apprehension and kinesthetic sensation.

The body is the source as well as the site of discourses. It has been made the scale for separating discourses of the minute from discourses of the magnificent (Stewart 1984). Body puns, body metaphors, and body symbols inform the body of state, the corporate body, and nature of knowledge. The predominance of visual metaphors in epistemological discourse since the Enlightenment has sustained the estrangement of perceiver from perceived in Western thought. Lingual metaphors reincorporate thought as bodily knowledge (Neustadt 1994). Corporeal discourses extruded off the body invest corporeality in material culture as well. The pots Native American women produce bodily are also held to reproduce them bodily, so that objects take on the sensuous properties of subjects (Babcock 1994).

Bodylore relates investigations of the cosmological body of myth, of ritual acts, religious bodies and body taboos, of emotion, spirituality, and intellection as bodily phenomena, of bodily substances and insubstantial bodies, of the fluid body, the solid body, and the spirit body, of the domesticated body and the transgressive body, of the private body and the body politic, to ongoing investigations of the body in other fields of inquiry.

Boggs, Ralph Steele (1901–1994)

Teacher, bibliographer, and pioneering student of Latin American folklore and folkloristics. Born in Terre Haute, Indiana, Boggs became interested in folklore at the University of Chicago, where he studied with Archer Taylor and earned his Ph.D. in Spanish in 1930. His dissertation on the folktales of Spain was published in *Folklore Fellows Communications* the same year.

He had particularly strong ties with the University of North Carolina (UNC) at Chapel Hill, where he taught from 1929 until 1950 when he accepted a post at the University of Miami. During his first year in Chapel Hill, he introduced the first folklore course taught at the university. In the 1930s, he began to forge ties with faculty members who shared his folkloric interests—Guy Benton Johnson (sociology), Arthur Palmer Hudson (English), Frederick Koch (drama), Urban Tigner Holmes (romance languages), Jan P. Schinhan (music), and Richard Jente (German). By 1940 Boggs had established the university's curriculum in folklore, the first folklore graduate program in the United States.

His outreach continued at the University of Miami, where Boggs taught from 1950 until his retirement in 1967. There he developed extensive contacts with Latin American folklorists. He served as director of the Hispanic American Institute and developed that into the university's International Center.

Boggs founded the periodical *Folklore Americas* and the journal *North Carolina Folklore*, and he was the author of 150 books and articles on folklore and Spanish literature. When *Southern Folklore Quarterly* began publication in 1937, he was asked to compile an annual bibliography of publications on folklore, a task that he continued for twenty-two years.

Boggs and his wife, Edna Garrido de Boggs, herself the author of studies of Dominican folklore, remained professionally active long after his retirement. They donated to the UNC library his books, recordings, and most notably his seventysix volumes of *Biographic Documentation* that include correspondence with leading folklorists in the United States, Europe, and especially Latin America.

Botkin, Benjamin A. (1901–1975)

Folklorist; best known for his annotated anthologies of folklore from oral tradition and print sources and for his early advocacy of applied folklore and multicultural studies. Botkin was educated at Harvard University (M.A., 1920, magna cum laude), Columbia University (M.A., 1921), and the University of Nebraska (Ph.D., 1931). He founded and edited the regional annual *Folk-Say* (1929–1932). “Folk-say” is a term Botkin “coined in 1928 to designate unwritten history and literature in particular and oral, linguistic, and floating material in general.”

He went to Washington DC on a Julius Rosenwald Fellowship in 1937 to do research at the Library of Congress in Southern folk and regional literature. From 1938 to 1941, he was, successively, national folklore editor of the Federal Writers’ Project, cofounder and chairman of the Joint Committee on Folk Arts of the Works Progress Administration (WPA), and chief editor of the Writers’ Unit of the Library of Congress Project; in 1941 he became a Library of Congress Fellow in Folklore (Honorary Fellow 1942–1956). In 1942 he was named head of the library’s Archive of Folk Song.

In 1945, while president of the American Folklore Society, Botkin resigned from the library and moved to New York to devote himself to writing full time. About that time, his interest shifted from rural to urban folklore, work helped by a Guggenheim Fellowship in 1951. Botkin’s first book was *The American Play-Party Song* (1937), a study of frontier game songs. *Lay My Burden Down: A Folk History of Slavery* (1945), based on WPA interviews with ex-slaves, is one of the key documents in the development of oral history. His other books were annotated collections of regional or occupational folklore culled from oral, printed, and archival sources. The first and best known of these was *A Treasury of American Folklore* (1944).

Botkin’s background and interests were broadly humanistic. He knew folklore, but he also knew literature, politics, and music. His brother was a painter, his cousins George and Ira Gershwin, a composer and a lyricist. Botkin himself published poetry before he published folklore, and he continued publishing it for many years. When asked his occupation, Botkin responded “Writer,” not “Folklorist.” Botkin saw the study of folklore as part of the study of culture rather than a field of independent value in its own right. He was less interested in survival folklore (which was the focus of concern of many of his contemporaries in the field) than in multiculturalism, urban folklore, occupational folklore, and especially applied folklore, which he said was “folklore for understanding and creating understanding.”

Breakdancing

Or “breaking”—a specific genre of competitive, physically demanding, injury-risky, artistically inventive, pyrotechnic acrobatic and gymnastic dance movements. These include head spins from a headstand with hands in the air; back spins with legs tucked up and held by arms; “baby swipes,” or handstands in which the legs scissor sharply across each other and the hips spiral with the legs; “suicides,” or no-hands forward flips landing flat on the back; and “hand glides,” in which one hand supports the body while the other propels the body in a spin.

Breakdancing developed in the 1970s and came to public attention from the Bronx borough of New York City in the early 1980s. The undocumented early history is wreathed in legend. Similar to dances in other parts of the United States, breakdancing extended African traditions of male youth competition, innovation, self-expression and male bravura, comment on current life, and warrior dances. During the late 1960s, immigrant West African dancers and musicians began performing and teaching in American public schools and for professional and amateur dancers; some Black Americans traveled to Africa to bring back traditions to teach and perform. Also influencing the development of breakdance were West Indian rapping (rhythmic spoken or chanted musical accompaniment), the Afro-Brazilian martial art of *capoiera*, the African American dance repertoire, including the Lindy and the Charleston, and mainstream culture. The legendary Black singer James Brown’s athletic, frenetic dancing to his 1969 hit song “Get on the Good Foot” catalyzed experimentation with movement forms in which “b-boys,” young Black and Hispanic dancers, became proficient.

Concerned with increasing inner-city gang violence, Afrika Bambaataa encouraged breakdancing as a peaceful alternative. He founded the Zulu Nation, a loose confederation of Bronx dance crews. Intensely competitive dance “battles” occurred between warring factions. This spread to localities from New York to California. Breaking was a way to be Number One without “blowing somebody away,” in some instances killing. However, police sometimes arrested breakdancers, thinking they were fighting. Dancers were banned from city streets and shopping malls for causing disturbances and attracting undesirable crowds. Occasionally, a dance battle escalated into actual violence.

Breakdancers and onlookers form an impromptu circle, and each performer has a brief turn in the ring. Common breakdancing choreographic segments are robot-like movements and other mime sequences known collectively as “electric boogie.” Movements include the wave, the tick, the mannequin, the walls, the King Tut (miming figures in Egyptian hieroglyphics), popping (isolating body parts in robot-like segmentation), pop-locking (locking joints in place between movements in exaggeration for comic effect), glides, *huevos* (dancers walk on the toes of shoes one size larger than usual and stuffed with newspaper), moon walks (shifting weight from one leg to the other and sliding backward), athletic steps such as “uprocking” (mimed fighting and insults)

and “top-rocking” (standing and performing foot movements), breaking, and shaming through mimed insults between dancers.

Ghetto breakdancers express personal style and gain a sense of power while also conveying flamboyant, energetic group identity, values, and aesthetics. The dance is the most recent part of the former underground hip-hop social and political youth movement with its wild-style graffiti art, special slang and clothing, and rap music. Breakdancing music is played on a recorded disco rhythm track. Common rap themes are personal self-aggrandizement and comments about women, the police, and society. There are a few female breakdancers.

Media obsession with breakdancing popularized it nationwide. The ABC *20/20* television news show aired young street-gang members settling disputes through dance. *Mademoiselle*, *Time*, *Rolling Stone*, *People*, *Newsweek*, and the *Washington Post* all ran pieces that spotlighted breakdancing. Burger King and Pepsi ads on television showed breaking. The first hip-hop feature film, *Wild Style* highlighted breakdancers, as did the film *Beat Street*.

Outstanding breakdancers gained financial rewards through performing on the street, in theaters, at birthday parties and bar mitzvahs, through club bookings and international tours, and on television and film. They gave classes at college campuses, grade schools, exercise studios, and recreation centers.

The media hype eventually altered breakdancing’s form and meaning. The circular format became linear, the style became standardized with less improvisation, and acrobatics overshadowed the “freeze” (a held, often seemingly impossible position of personal and group expression). Like many popular dances, breakdancing became part of the formalized history of Black folklore. By the 1980s, street kids believed that breaking no longer belonged to them and went on to create new dances.

Brewer, John Mason (1896–1975)

Texas' most prominent Black writer and one of the nation's leading black folklorists. Brewer (who published as J.Mason Brewer) was the first Black member of the Texas Folklore Society and the first Black to serve as vice president of the American Folklore Society. In 1954, he also became the first African American member of the Texas Institute of Letters after Theta Sigma Phi recognized him as one of twenty-five best Texas authors following one of his most notable publications, *The Word on the Brazos: Negro Preacher Tales from the Brazos Bottoms of Texas* (1954).

Born in Goliad, Texas, Brewer received his early education in the Black public schools in Austin and then earned a B.A. degree in 1917 from Wiley College in Marshall, Texas. He served as a French interpreter for the American Expediting Forces (AEF) in 1918 before turning to teaching and later becoming a principal in Fort Worth, Texas. Brewer later wrote stories and poems that he published in both a Colorado oil company's trade journal and a national journal, *American Negro*. Before returning to Texas, Brewer briefly held a professorship at Claflin College in Orangeburg, South Carolina, and then was a professor in 1926 at Huston-Tillotson College in Austin, where he met University of Texas Professor J.Frank Dobie, who encouraged him to collect and publish African American folklore. In 1950 Brewer earned an M.A. from Indiana University; he then earned an honorary doctorate a year later from Paul Quinn College, a Methodist College in Waco, Texas.

Like Zora Neale Hurston, Brewer employed Black dialects when documenting stories he collected from his informants. A regular contributor to the annual publications of the Texas Folklore Society, Brewer's earliest collection of African American slave tales appeared as the lead chapter in *Tone the Bell Easy* (1932), under the title "Juneteenth." His most notable works include *Aunt Dicy Tales* (1956), *Dog Ghosts and Other Negro Folk Tales* (1958), *Worse Days and Better Times* (1965), and an anthology, *American Negro Folklore* (1968), for which he received the Chicago Book Fair Award in 1968 and the Twenty-first Annual Writers' Roundup award for one of the outstanding books written by a Texas author in 1969. Besides the recognition he received from folklorists as the best storyteller of Black folklore anywhere in America, Brewer also lectured at Yale University, the University of Texas, Duke University, the University of Colorado, and the University of Arizona.

After several years of teaching at Livingston College in Salisbury, North Carolina, Brewer returned to Texas and was a distinguished visiting professor at East Texas State University in Commerce from 1969 until his death on January 24, 1975. The following year, Brewer appeared in *Who's Who in America*.

Brewster, Paul G. (1898–?)

Folksong and folk-game scholar. Born in Stendal, Indiana, he earned a B.S. degree from Oakland City College in Indiana in 1920 and an M.A. from the University of Oklahoma in 1925. Most of Brewster's teaching career was at Tennessee Technological University.

American folklorists are mostly familiar with Brewster's folksong scholarship. His historic-geographic emphasis, conclusions, collection techniques, presentation style, and perceptions of who constitutes "the folk" and what constitutes "folklore" are typical of his better contemporaries.

Brewster's sixty-five publications on folk games are likewise typical of his time. However, his continual, extensive, and intensive research in this genre is atypical and, thus, ultimately more significant to folklore studies. While adding little theoretically to the study of games, Brewster's *American Nonsinging Games* (1953) is probably his most important work because it does not focus on games with music as many preceding studies had.

Brewster published on a wide variety of other genres, including folk medicine, riddles, narratives, jokes, and rituals, and on such exotic topics as snake handling and fire walking. During the middle of the 20th century, Brewster became better known internationally than in America by often cowriting works with foreign folklorists, having these works published overseas, and writing about such people as Czechoslovaks, Hungarians, East Indians, Nigerians, Malaysians, Egyptians, Russians, Iranians, and Tibetans, among others.

Although Brewster, along with Robert E. Allen, was a founding member of the Hoosier Folklore Society in 1937, he was not a member of the American Folklore Society. Instead, he belonged to the Gypsy Lore Society (a folk group on which he never published) and the American Dialect Society.

Despite Brewster's early promise, competent scholarship, and more than 100 publications, he never completed his Ph.D. in folklore at Indiana University, he lacked professional advancement, and he shifted to international contacts in midcareer. American folklorists tend to explain these anomalies through multiple and inconsistent stories—none verifiable—usually involving some type of scandal. Thus, the folklorist himself, in this case, has become the subject of folklore.

Bridger, Jim (1804–1881)

Mountain man, trapper, explorer, guide, storyteller. As a teenager, Bridger ran away from a blacksmith's apprenticeship in St. Louis to join William Ashley's fur-trapping expedition. For the next twenty years, he roamed and explored the vast territory from northern New Mexico to the Canadian border. He became the first White man to see the Great Salt Lake after braving the rapids of the Bear River in a skin canoe, and he also was among the first to report on the natural wonders of Yellowstone country.

Bridger and a few associates challenged the near monopoly of larger fur-trapping interests in the West. Men willing to work for substantially reduced wages clamored for the opportunity to join the famous Jim Bridger. When the fur market declined in the early 1840s, he established Fort Bridger on the Oregon Trail in southwestern Wyoming. The fort supplied many immigrants heading West, including the first Mormon (Latter Day Saints) pioneers, whom Bridger led into the Great Salt Lake Valley.

Bridger fell out with the Saints when they suspected him of stirring up the Indians. In 1853 Mormon militiamen seized and plundered Fort Bridger. It is no surprise, then, that in 1857–1858 Bridger eagerly guided Colonel Albert Sidney Johnson's expedition to crush an ostensible Mormon rebellion.

In his later years, his health and eyesight failed him; he died near Kansas City, Missouri, in 1881.

Bridger's life reflected the mixing of cultures and turbulent times of the early frontier era. Though illiterate, he spoke Spanish, French, and several Indian languages. He was initiated into the Crow tribe, and his third marriage, to an Indian woman, made him a son-in-law to the Shoshone head chief Washakie. He was a believer in Indian religion and magic, and he adopted many Native American customs, including taking the scalps of the men he slew.

Jim Bridger is both the source and the subject of some of the American West's most famous folklore. He was a renowned storyteller, but many fantastic tales that he never told as truth—and often never actually told at all—were ascribed to him by later Westerners. Two examples are the tale of a petrified forest where petrified birds would sing songs that could not be heard (because they were petrified), and the tale of a stream that was cool at the bottom and boiling on top, where if one caught a fish and brought it up slowly, it would be cooked and ready to eat when pulled out of the water. His serious descriptions of natural features were always accurate, and his incredible geographic knowledge was invaluable to map makers.

Bridger's name became immortalized not only through his place in American folklore as "King of the Mountain Men" but also by the Bridger Mountains, Bridger Pass, and the Bridger National Forest in Wyoming.

Bronson, Bertrand Harris (1902–1986)

Ballad scholar, musicologist, and professor of English at the University of California, Berkeley, from 1927 to 1970. While Bronson's career as a scholar (he would have said "student") of English literature cannot be overlooked (he did important studies on Chaucer, Joseph Ritson, Samuel Johnson, and the Enlightenment), his essential contributions to the study of folklore might be symbolized by the title of his 1969 collection of essays: *The Balladas Song*. The founders of American folkloristics emphasized folksongs as cornerstone artifacts in the budding discipline, but paradoxically they most often treated the material as "folk poetry." Francis James Child, for example, gave only a handful of tunes to accompany the hundreds of texts in his *English and Scottish Popular Ballads*.

In his *Traditional Tunes of the Child Ballads* (1959–1972), Bronson set out to track down all of the extant tunes associated with ballads from Child's corpus. The resulting four-volume monument of scholarship not only provides us a cornucopia of melodies and texts, of references to popular discs and archival recordings, but also—because Bronson included texts to the melodies—outdoes Child himself. In other research, Bronson pioneered the use of computers in musicological research as early as the 1940s and developed a scheme of melodic classification (the "mode star").

By insisting that folksongs are to be sung, Bronson played an important role in legitimizing the folksong revival and in preparing the way for folklore's later emphasis on performance studies. It is folly, Bronson argued, to tear text and tune asunder, or to divest either of their reasons for being: folksingers, musicians, and audiences in performance contexts.

Broonzy, Big Bill (1893–1958)

Blues singer. William Lee Conley Broonzy was born in Scott, Mississippi, to a family of seventeen children, but he grew up on a farm near Pine Bluff, Arkansas. There he learned violin from an uncle, Jerry Belcher, and later became proficient on the guitar and mandolin. In his early teens, he started entertaining at local parties and picnics. Then, after a brief stint in the army during World War I, Broonzy worked as a musician in Little Rock clubs until he moved to Chicago in 1920.

In the Windy City, Broonzy met a large number of musicians and worked with several of them in local clubs. Still, it was six years before he made his first record; thereafter he had at least one session a year until 1957. During those thirtyone years, he recorded a variety of sides ranging from country and dance pieces (“Saturday Night Rub,” “Guitar Rag”) to hokum blues (“Somebody’s Been Using That Thing”) to Bluebird blues (“You Know I Gotta Reason”) to protest material (“Black, Brown, and White”).

Broonzy’s recording career had three distinct phases. The decade 1926 to 1936 was largely given over to hokum (lighthearted sides featuring lyrics filled with sexual metaphors and including jokes and verbal interplay), and also to rags. The period 1936 to 1942 was the Bluebird period, an era when he recorded formulaic blues for the Bluebird label. These records usually featured small groups often made up of bass, piano, drums, trumpets, clarinets, or saxophones. In the late 1940s, Broonzy became a favorite on the New York City “folk” circuit, and he emphasized a very diverse repertoire, including ballads, gospel numbers, and contemporary songs, as well as blues. This new audience was primarily White, and their acclaim probably led to the 1955 publication of a ghostwritten autobiography, *Big Bill Blues* (rev. ed. 1964). Broonzy continued playing concerts in Europe and America until illness forced him to halt those activities in 1957. He died of cancer the following year.

Broonzy was one of the most frequently recorded of blues singers and is noteworthy as a link between the country and the urban blues traditions. His generosity, wit, support of younger singers, and his considerable talents, combined to make him one of the most popular of all blues musicians.

Brother Jonathan

A caricature of the American common man, popular from the late 1700s until the mid-19th century. Brother Jonathan descends from Yankee Doodle and sires Uncle Sam. His fictive life spans the years from the end of the American Revolution to shortly after the Civil War, when he appears in hundreds of political cartoons, in countless humorous anecdotes printed in almanacs and jest books, in popular verse, and most importantly in American theatrical comedies.

During the heyday of his popularity in the first half of the 19th century, he was a major American icon whose crude ruralisms reflected backwoods demeanors of American settlers. He came into prominence when into his hands the spirit of Jacksonian democracy placed the political reins of a fledgling nation. Over the course of his life, he took on many guises. As a manservant, Jonathan was fiercely loyal to his master and country; as a shrewd peddler, he profited from his customer's dull wit; as a cracker-barrel philosopher, his backwoods simplicity and practicality confounded sophisticated politicians. He rolled up his sleeves and tore into challenges that faced the young nation and sought to present a strident warning to any power, foreign or internal.

Brother Jonathan received his formal introduction to American audiences in Royall Tyler's successful comedy *The Contrast* (1787). In the play, Brother Jonathan is transplanted from the Vermont backwoods to the streets of New York City, where he encounters alluring prostitutes, the mysteries of the theater, and the stilted affectations of urban sophisticates. Although Tyler pokes at Jonathans naivete, his honest simplicity serves as a foil against the foppish mannerisms and shallow pretenses of city dwellers. In later plays, the figure of Brother Jonathan prides himself on his strong individualism and fierce nationalism. Through him, the American nation presented itself to the world.

During the second war of independence (War of 1812), Jonathan took up the banner of patriotism, extending his popularity across the seaboard states and the burgeoning frontier. Playwrights in particular re-created Jonathan in many of their dramatic productions, representing the American everyman, fiercely independent, stubborn, and sly. Between acts of other dramas, actors who were posed as Brother Jonathan dressed in the outfits of country bumpkins recited. They extended monologues complete with satire and country vernacular speech. Eventually, Jonathan figured in cartoons and in almanac humor.

Nearing mid-century, the image of Brother Jonathan began to lose its freshness and its popular appeal. Jonathan was depicted more and more as an ordinary American, less identified with his New England roots. Gradually, he began to appear as a reactionary, who offered tirades against immigrants and progressive political movements. Shortly after the Civil War, the figure of Brother Jonathan had outlived its usefulness, and only occasionally did he appear in British magazines as a caricature of Americans in general.

Brown, Frank Clyde (1870–1943)

Folklorist, teacher, and collector of North Carolina folklore. Born in Harrisonburg, Virginia, Brown made his home in Durham, North Carolina, after earning an A.B. degree in 1893 from the University of Nashville, Tennessee, and his M.A. and Ph.D. degrees in 1902 and 1908, respectively, from the University of Chicago. At Trinity College (now Duke University), he began a lifelong career as professor of English and also taught classes in folklore.

An energetic organizer, he responded to the urging of John Lomax, president of the American Folklore Society, to establish a local group to collect, preserve, and publish North Carolina folklore. At its first meeting in 1913, the North Carolina Folklore Society elected Brown secretary-treasurer, a post he held until he died. From its beginning, the society planned to publish a collection of North Carolina folklore under Brown's supervision, and Brown inspired numerous contributors to help him amass a state collection that remains one of the largest of its kind. He himself traveled extensively throughout the state recording folksongs.

The publication of *The Frank C. Brown Collection of North Carolina Folklore* (1952–1964) did not occur until after his death. Brown had firmly resisted publication, often citing incompleteness even though the collection reached gargantuan proportions—more than 38,000 items from more than 650 contributors. With Professor Newman Ivey White as general editor, and a distinguished team of specialized editors, Duke University Press posthumously published the seven-volume collection that bears Brown's name. It reflects genres considered important at the time but omits many folklore forms current in the state. All materials related to the Brown Collection are deposited in Duke University's Perkins Library.

Bunyan, Paul

Giant, fictitious logger capable of Herculean deeds and perhaps America's best-known folk hero, a demigod symbolic of American aspirations and identity. His protean manifestations include the oral traditions of loggers, literature written for children, advertising symbols, honorific statues, and community festivals and pageants. The name probably originates from a 19th-century logger who actually worked in Canada or the United States, although an unlikely phonetic link to the popu-

lar but diminutive French trickster figure Bon Jean has been suggested.

Folklorists and popular writers have adduced some evidence of the existence of Bunyan tales among late-19th-century loggers in eastern Canada and the American Northeast and Upper Midwest. However, the first description of a Paul Bunyan tale in print did not occur until journalist James McGillivray wrote several essays entitled "The Round River Drive" for Upper Midwest newspapers in 1906 and 1910. In 1914, William B. Laughead, an advertising executive for the Red River Lumber Company, a large logging firm known for its eccentric advertising strategies, initiated a publicity campaign and a series of publications featuring the exploits of Paul Bunyan. Booklets of Bunyan stories and colorful illustrations were distributed by the company free of charge for decades; no attempt was made to copyright the figure of Bunyan; and the company vigorously encouraged its adoption outside the industry by writers in order to enhance its own name recognition. Laughead was the author of the booklets' stories, which he freely admitted were literary embellishments of a small amount of oral tradition he had encountered over a decade before in the logging camps around Bemidji, Minnesota.

Laughead's tales clearly draw upon the outrageous character and motifs of American tall tales, with all of their comic extravagance. The giant logger himself is depicted as a leader of men, incredibly strong and hardworking, and blessed with an innate sense of entrepreneurial ingenuity. To accompany Bunyan, Laughead fabricated or reinvented a complete cast of larger-than-life characters, often with a distinctly Scandinavian flavor: Babe, Paul's giant Blue Ox, was joined by such logging camp companions as Johnny Inkslinger, camp clerk; Big Ole, the blacksmith; Sourdough Sam, the cook; and Shot Gunderson, Paul's foreman. The stories often had an etiological theme: Paul dug the Great Lakes to serve as Babe's water hole; the Mississippi River sprang forth when Paul's water tank leaked. Other tales revolved around superhuman deeds: to shoe Babe, who was seven ax handles wide between the eyes, required the ore of an entire Minnesota iron mine; to expedite logging, Paul and Babe simply hauled entire sections of forestland to where trees could be cut as if shearing sheep; a winter of blue snow was caused by Paul swearing a blue streak after hitting his thumb with a sixteen-pound hammer.

Through the 1920s and 1930s, other writers built on Laughead's foundation with their own literary embellishments. Ida V. Turney, Esther Shephard, James Stevens, and many other authors wrote articles and books, first for adults but then almost exclusively for a juvenile audience. By the end of World War II, Bunyan had been incorporated into virtually all aspects of popular and elite art, including plays, vocal and instrumental music, ballets, murals, and paintings, the poetry of Robert Frost and Carl Sandburg, and even an operetta by W.H. Auden and Benjamin Britten. On a regional level, tales of Bunyan as a master driller in the Texas oil fields circulated in local oral tradition. In the Upper Midwest and Pacific Northwest, community festivals and pageants celebrated local lumbering heritage with tributes to Bunyan and the average working logger. Respected men and women were selected to serve as honorary Paul and Pauline Bunyans,

representing the social order of married model employees in the new paternalistic company towns that replaced transient logging camps.

The fascination with Paul Bunyan continues in local and popular culture. As the subject of television cartoons and children's books, he is in the late 20th century more likely to be portrayed as a reformed, ecologically minded woodsman who loves wilderness than as a rapacious destroyer of nature's forests. Giant statues of Bunyan—with his classic muscular build, beard, plaid shirt, and stocking cap—delight tourists in areas that have had logging-dominated economies. Folklorists still record the occasional Bunyan tale from older loggers and woodsmen, although such stories almost certainly derive from literary texts. Those same workers are now more likely to write songs and poems that highlight Paul's abilities as both a logger and a tree planter. Community festivals still feature honorary Paul Bunyans and Bunyanesque loggers participating in local competitions of occupational skills.

Interpretations abound of Paul Bunyan's significance to American culture. Folklorist Richard M. Dorson argued that Bunyan was pure "fakelore," a spurious, commercialized creation that belonged in the pantheon of other contrived American "folk heroes": Pecos Bill, the cowboy; Joe Magarac, the steelworker; Febold Feboldson, the Nebraska plainsman. Most folklorists agree that such big, powerful, efficient workers of our industrial age were symbolic embodiments of the heroic virtues of American identity, models of resilient rugged individualism, and symbols of American's mastery over nature. Folklorist Alan Dundes believes that Bunyan, as a giant, indefatigable industrial worker, was a concise assertion of early-20th-century national identity and strength and thus fulfilled a national psychic need, appearing when America suffered from an acute national inferiority complex, before becoming an acknowledged superpower. Paul Bunyan's significance also lies in how he was used in relationship to the labor force from which he purportedly originated. Bunyan's emergence through corporate sponsorship during a period of intense labor unrest early in the 20th century, and the accompanying explosion of imagery and concocted narrative in publications loggers read (including local newspapers and trade journals), made woodsmen well aware of his presence. Paul Bunyan became a quintessential model for labor, a paragon of conformity to an unattainable work ethic—for Paul Bunyan represents the single, male, superproductive laborer for whom the work and its attendant lifestyle are their rewards, who is able to shun all notions of social mobility for the pride of group membership and the nobility of toil. Bunyanesque loggers do not quit or complain and, by extension, do not revolt. Labor, management, and the nation thus collaborated in containing and ennobling the American logger, a proud producer of American consumable natural resources, a hero of free enterprise.

Cadence Chant

Folk rhyme used in the military to coordinate the marching of soldiers. Also termed cadence calls, their two basic tempos correspond to the two main speeds of march, quick time and double time, but rhythmic variation is possible. George G. Carey noted six distinct metric patterns for double-time chants alone in studying cadence calls in the Army's 101st Airborne Division. Since any song lyric in 2/2, 2/4, or 4/4 time can be appropriated for use in the chants in performance, the possible variation in rhyme schemes is great. And since, like sea chanties, track-lining songs, and field hollers, cadence chants help time the physical actions of a group and lessen the energy they expend, it is not surprising that they have the same pattern of oral delivery—a solo line with a choral response. Also not surprisingly, the words “left” and “right” often appear as the appropriate foot touches down, as in: Solo (leader): “You had a good home but you left.” Group (soldiers): “You’re right!”

The subject matter of the chants varies from approval to criticism of military life and may function to build esprit de corps, complain about conditions and treatment, or lament the loss of civilian niceties; the variation here usually depends on whether the solo leader is a private soldier, an officer or a noncommissioned officer (NCO), a draftee, or a volunteer. The folk character Jody, a mythical civilian who takes advantage of soldiers' absence to appropriate their cars, clothes, and girlfriends or wives, appears in many cadence chants.

Cajuns

Descendants of French-speaking Acadians who settled in south Louisiana after being deported by the British from Nova Scotia, formerly known as L'Acadie. "Cajun" is a corruption of *Acadien*, or *Cadien*, the French term that former inhabitants of L'Acadie and their descendants called themselves. The term "acadie" derives from a Micmac word rendered in French as *cadie* (land of plenty). Permanent settlement of Acadia began during the first decade of the 17th century, and Acadians were among the first European immigrants to develop a distinct North American identity (Brasseaux 1987:161–172).

Acadian folk culture emerged as French and Native American traditions blended and adaptations to a special maritime environment were forged. Acadians were also affected by 150 years of colonial conflict between France and England. After the Treaty of Utrecht in 1713, which ceded Acadia to Britain, the Acadians became French neutrals, and Acadia was renamed Nova Scotia. Their fate was ultimately sealed when they refused to sign an unconditional oath of allegiance to England, which would have required them to give up their Catholic religion and take up arms against their kinsmen and Indian allies. *Le Grand Dérangement*, the Acadian deportation from Nova Scotia, which began in 1755 and continued until the Treaty of Paris in 1763, put an end to hostilities between France and England. Between 2,500 and 3,000 exiled Acadians arrived in Louisiana between 1764 and 1803 and tried to reestablish their former society.

In the 1990s, the core Cajun population resides in south Louisiana within a more or less triangular-shaped region with its apex near Alexandria. However, communities of migrant Cajuns have resettled in east Texas, California, and elsewhere in the United States. In the face of complex social, cultural, and demographic transformation, Cajuns maintain a sense of group identity and continue to display a distinctive set of cultural expressions nearly two-and-one-half centuries following their exile from Acadia.

Popular and stereotypical images have long tended to skew representations of Cajun history and culture. Henry Wadsworth Longfellow's popular poem *Evangeline*, originally published in 1847, inspired romantic depictions of Cajuns as pious, peace-loving, pastoral peasants carrying forth timeless

French traditions. Louisiana writer Felix Voorhies' *Acadian Reminiscences: The True Story of Evangeline* (1907), another telling of the Acadian tragedy featuring characters with believable local Cajun names, inspired local interest and ethnic pride. During the 1920s, young girls dressed in peasant maiden "Evangeline" costumes helped campaign for the establishment of a national shrine; Longfellow-Evangeline State Park was eventually established in St. Martinsville (Brasseaux 1988). Before and after the 1955 bicentennial of the Acadian exile, political leaders like Dudley LeBlanc and Roy Theriot helped advance a growing Cajun revival by reenforcing the connection between Cajun identity and the Acadian saga. Popular notions about Cajun identity thus tended to ignore the dynamic sociocultural realities of the 19th and 20th centuries. But, in retrospect, however inaccurate these representations may seem, they appear mild compared to some of the misrepresentations proliferating at the end of the 20th century as a result of the unbridled commercialization of Cajun "chic" by entrepreneurs in the food, music, entertainment, and tourism industries. In the 1900s popular culture, Cajuns seem to be alternately presented as swamp-dwelling, homicidal outcasts or as humorous, wine- and hot sauceguzzling chefs.

Recent scholarship has presented more complete and balanced views of Cajun culture. Historian Carl A. Brasseaux, in *The Founding of New Acadia*, explores social history in early Louisiana Cajun settlements. In order to survive in Spanish Louisiana, Cajuns made great adjustments to new environmental and social factors. They learned to live in a diverse society populated by European, African, Asian, and West Indian immigrants,

Louisiana Creoles, and Indians. They learned about slavery and some became slaveholders. Brasseaux's *Acadian to Cajun: Transformation of a People, 1803–1877* (1992) demonstrates how 19th-century changes, like those resulting in the formation of separate and distinct Cajun socioeconomic classes, affected Cajun folklife and contributed to the development of modern Cajun society. He also investigates the darker sides of Cajun violence and racism before and after the Civil War.

Most misunderstandings concerning the genealogical “purity” of Louisiana Acadian-Cajun stock have been addressed by scholars. With regard to ancestral origin, modern-day Cajuns are far from homogenous, if indeed any group of Acadians ever was. In *The People Called Cajuns: An Introduction to an Ethnohistory* (1983), James Dormon discusses the complex demographic history of Louisiana Cajuns and the difficulties of trying to define them in terms of Acadian ancestry. The ancestors of 18th-century Acadian immigrants to Louisiana included peoples from various parts of France, native Micmacs, some Scots, Basques, and others of assorted European ancestry. Once in Louisiana, Acadians intermarried and/or mixed with neighboring Native Americans, foreign immigrants, and native Louisiana-born people of German, French, Spanish, African, Asian, and other origins. Living side by side with families named Thibodeaux, Breaux, and Hebert are Cajuns named Abshire, McGee, Reed, Walker, Brown, Rodriguez, and Schexnayder.

Neither does Cajun material culture represent, to any significant degree, the diffusion and survival of forms from ancient L'Acadie. For example, Acadians arriving in Louisiana borrowed from existing folk architectural patterns, innovating and expanding as needed (Ancelet, Edwards, and Pitre 1991; Edwards 1986). After several generations, their raised houses, with full incised galleries, were practically identical to other Creole houses of Louisiana much different from those in their pre-expulsion villages. Malcolm Comeaux has identified and described the typical Louisiana Cajun barn (*hangar*) (Comeaux 1989). Its features do not resemble maritime Acadian or French barns. Comeaux postulates that the Cajun barn, with its characteristic square floor plan and identifying incised and enclosed gable-front entrance, was borrowed from neighboring German farmers who were already established along the Mississippi River before the Acadians arrived in Louisiana. Acadians certainly brought boatbuilding skills from their maritime homeland, but Louisiana Cajun watercraft bear few resemblances to those of Nova Scotia. In the case of the sailing lugger, the most common Louisiana fishing boat used by coastal Cajuns throughout the 19th century, the sailing rig may have remained constant, but the shape and construction of the hull, the internal arrangement of space, and the entire superstructure evolved with input from Italian, Dalmatian, and Canary Island fishermen into a form distinctive to the northern Gulf Coast (Brassieur 1990).

Many elements of Cajun expressive culture can best be understood in terms of creolization, the dynamic process of cultural blending that occurs when diverse populations interact. Cajun foodways certainly represent a blend. The ideas, if not the specific recipes or ingredients, for stews and sauces thickened with *roux*, seafood *courtboullion*, *etouffé*, *boudin*, *andouille*, *chaudin* (stuffed pork stomach), *crêpes*, *beignets*, and other Cajun culinary items were transplanted to Louisiana from France and Acadia. Corn dishes like *macquechoux* (stewed fresh corn), *sagamité* (hominy-grits) and *couche-couche* (skillet-fried cornmeal), *filé* (ground sassafras leaves), *tasso* (dried or smoked meat), along with dishes prepared from native fish and game, fruits, and

vegetables, all represent contributions to Cajun cuisine from Native Americans. Gumbo and jambalaya are African in origin. Okra (called *gumbo févi* in Cajun French) was imported from western Africa, where it is called *guingombo*. Cayenne and other hot peppers, native to the Americas, represent Spanish and Afro-Caribbean influences. The Cajun preference for rice as a staple began to develop toward the end of the 19th century. The widespread consumption of crawfish, an activity now popularly linked with Cajun identity, is a relatively new trend in Cajun cuisine (Comeaux 1972).

Cajuns are perhaps best known by their music and, like most other features of Cajun culture, it, too, represents a dynamic blending of diverse elements. Barry Jean Ancelet characterizes Cajun music as “a blend of German, Spanish, Scottish, Irish, Anglo American, Afro-Caribbean, and American Indian influences with a base of western French and French Acadian folk tradition” (Ancelet 1989:1). Unaccompanied French folksongs and ballads, as well as instrumental dance music, came to Louisiana from France, either through Acadia, by way of other parts of French America, or more directly from the European continent. These older forms blended with rhythmic and percussive elements, syncopation and singing styles brought to Louisiana from Africa, Anglo American folk music and song traditions, and popular European and American musical trends to influence the development of Cajun music. Changes in instrumentation, beginning with the introduction of the diatonic accordion, and later the steel guitar, electric guitar and bass, and full drum set transformed Cajun music during the 20th century. The musical duets of White fiddler Dennis McGee and Black accordionist Amadé Ardoin, recorded in the late 1920s to 1930s, characterize the metamorphosis then occurring in Cajun dance music.

A strong Americanizing trend, reflected in Cajun music by an increasing use of English lyrics and by the strong influence of nationally popular country string-band music, like that produced by Bob Wills and the Texas Playboys, typified the 1930s and 1940s. In place of the accordion, the steel guitar, electric guitar and bass, and full trap drum set joined the violin to become preferred instruments. However, a renewal of older musical forms featuring accordion and French lyrics began during the late 1940s and was aroused, according to Ancelet, by the need among returning World War II veterans to hear homemade music (Ancelet 1989). Iry Lejeune, a young accordionist from Point Noir, led the vanguard of excellent bandleader-accordionists that included Lawrence Walker, Nathan Abshire, Aldus Roger, and Austin Pitre.

During the 1960s, with the rising popularity of rock and roll and rhythm and blues, and with the subsequent reinvasion of this music from England by groups like the Beatles and the Rolling Stones, Cajun music increasingly became the music of the older generations. The work of folklorists, music producers, and musicians from both inside and outside Cajun culture reversed this trend. In 1964 traditional Cajun musicians Gladius Thibodeaux, Vinesse Lejeune, and Dewey Balfa performed at the Newport Folk Festival, where they awakened the world to the excitement of Cajun music. Balfa became an effective spokesperson, and the recordings he made with his brothers and other musicians serve as models to aspiring young Cajun artists. In 1974 the first Tribute to Cajun Music Festival was held in Lafayette; this festival continues to provide the opportunity to honor older heroes and a stage where younger musicians are brought to light. The phenomenal international, national, and local successes of Zachary Richard, Michael Doucet and Beausoleil, Wayne Toups, Bruce Daignepon, Steve Rile, and many

other younger musicians and groups has propelled Cajun music into widespread popularity. The amazing and unprecedented rise in popularity of Cajun music during the 1980s, both inside and outside of the culture, appears to carry forth with no abatement, and another generation of young virtuoso performers is proudly taking its place on the bandstand.

Mardi Gras (literally “Fat Tuesday,” also known as Shrove Tuesday) is another element of Louisiana folk culture that has profited along with the growing Cajun cultural revitalization. Mardi Gras is tied to ancient folk Catholic (and earlier pre-Christian) annual ritual cycles and shares features with other New World French questing rituals such as *La Chandeleur*, practiced in the French Canadian Maritimes; *La Guillonné*, practiced in Missouri and Illinois; and various Carnival fêtes of the Caribbean. Features shared by these “begging quests” include disguise, suspension (or inversion) of ordinary rules of behavior, a traditional chant or song, rewards for performance, a leader and a band of followers, a round of house-to-house visits, at least the threat of pranks, and ritual “begging.” Beyond these basic similarities, the Mardi Gras ritual of each Cajun community in Louisiana has its own distinguishing features with regard to song texts, traditional role-playing, costumes, specific rules for participation, and modes of transportation (Ancelet, Edwards, and Pitre 1991). Although, like Cajun music, Mardi Gras is growing in popularity both within and without the culture, it is much more than a popular tourist attraction. From pre-event preparation to concluding communal gumbo, Mardi Gras continues to promote Cajun community cohesion and ethnic pride.

Cajun storytelling, particularly that performed in Cajun French, represents a vital aspect of cultural expression that has not received popular recognition on the same level with Cajun music or food, since it is inaccessible to most American audiences. In *Cajun and Creole Folktales: The French Oral Tradition of South Louisiana* (1994), Ancelet provides an excellent compilation of Cajun oral material that renders Louisiana dialects legible to readers of standard French and also provides English translations. Ancelet sorts his collection into animal tales, magic tales, jokes, lies and tall tales, Pascal stories, legendary tales, and historical tales; he pays particular attention to the context and language of events, as well as the repertoires and life stories of the storytellers. By presenting material from White Cajuns and Black Creoles together in one volume, Ancelet reminds us of the inextricable blend of expressive forms that make up Louisiana French life and lore. Another advantage of Ancelet’s work emerges from the extensive comparative notes provided for each piece. Through these annotations, the reader is connected with the work of earlier collectors and their collections of French material from Louisiana and elsewhere in the French-speaking world.

In spite of the overwhelming Cajun cultural revitalization that has been unfolding during the past few decades, questions concerning cultural continuity revolve around language retention. The oral French language spoken by Cajuns, which includes a range of distinctive local variation, was dominant in many communities in south Louisiana at the turn of the 20th century. The Progressive Era policies of the Theodore Roosevelt presidency, particularly those that established mandatory English-language education throughout the United States, severely altered this situation. Cajun children were punished for speaking French on the school grounds, and Cajuns who spoke no English, or those who spoke with a heavy accent, were often ridiculed and held as the butt of jokes. The powerful stigma that developed among native speakers of Cajun French

prohibited many parents from teaching French to their offspring. In 1968 the Council for the Development of French in Louisiana (CODOFIL) was established to help salvage a dying language. Its activities, particularly with regard to the promotion of Cajun music, contributed to the cultural revitalization, but the fate of Louisiana French language is far from secure. Within the last several years, a few south Louisiana parish school systems have initiated French-language-immersion curriculums for elementary schoolchildren. This approach has attained local popularity and success, but in the 1990s it is not widely available to Cajun children. In the meantime, while Cajun pride swells in many aspects of life, spoken French is becoming increasingly rare among Cajuns under forty years of age.

Since the late 18th century, Acadians and their descendants have adapted to new environmental conditions, adopted many American, European, Native American, African and Asian cultural traditions, and made innovations when necessary and desirable. Late-20th-century Cajun culture is certainly distinct, but it is also dynamic and difficult to define. Perhaps Cajuns are best characterized by their amazing adaptability to change, combined with a lively capacity to reinterpret and reshape cultural expressions to suit their own purposes, principles, and preferences.

Campa, Arthur Leon (1905–1978)

Authority on the culture of the American Southwest. Professor Campa was associated with the University of Denver as chairman of the Department of Modern Languages and Literature from 1946 until his retirement in 1972.

Born in Mexico, where his father was a Methodist missionary (killed by Pancho Villa in 1914), Campa grew up on a west Texas ranch, earning his B.A. and M.A. degrees from the University of New Mexico and his Ph.D. degree from Columbia University.

His advanced work in cultural anthropology prepared him to collect and interpret materials from his own region, and his knowledge of the traditions of *le gente*, his own people, provided him with inestimably rich resources for scholarly work. His magnum opus—*Hispanic Culture in the Southwest* (1979), published posthumously—was the product of fifty years of research. In it he showed that all aspects of culture, including the traditional materials of *le gente*—or, as a rural Anglo might translate the expression, “the folks”—are processes and products of a locale and a region. In addition to many articles appearing in popular and scholarly publications, Campa wrote *Spanish Folkpoetry in New Mexico* (1946) and *Treasure of Sangre de Cristos* (1962) and edited *The Brand Book* (1966).

Together with Levette Davidson and John Greenway, Campa helped bring the American folklore program of the University of Denver to national prominence in the 1950s. Campbell, Joseph (1904–1987)

Mythologist and literary scholar. Campbell is best known for his study of repetitive plot patterning in heroic tales cross-culturally, *The Hero with a Thousand Faces* (1949), and the four-volume *The Masks of God* series on the world’s mythologies (1959–1968). A professor of literature at Sarah Lawrence College in Bronxville, New York, from 1934 to 1972, Campbell took a universalist approach, positing that mythology is essential for human persistence and that myths are understandable only in terms of panhuman psychological processes and principles.

Campbell attributed the contemporary increase in, and pervasiveness of, violence, civil unrest, and dysfunctional family and other social relationships to the domination of science and a consequent rejection of mythology because of its imaginative nature. He insisted that science and mythology seem incompatible only when myths are viewed as factual historical narratives. When conceptualized as a creative and symbolic phenomenon that has its sources in the human psyche, however, mythology is not only seen as compatible with science, but its restorative and integrative potential also becomes

apparent. In the late 1980s, Campbell discussed these views at length with journalist Bill Moyers in a popular six-hour Public Broadcasting System television series, for which there was an accompanying and derivative book (1988).

Campbell's conception of, and approach to, mythology are often compared with those of psychoanalyst C.G.Jung. Scholars disagree about the extent to which Campbell may have been influenced by, or derived his own ideas from, Jung, but Campbell was explicit in his concurrence with many of Jung's views, crediting him in particular with recognizing that "the imageries of mythology and religion serve positive, life-furthering ends" (1972:13).

Campbell, Marie Alice (1903–1980)

Collector of southern Appalachian folklore and professor of folklore. Campbell was born in Tamms, Illinois. Influenced by John C. Campbell's *The Southern Highlander and His Homeland*, she accepted a position at the Hindman Settlement School at Caney Creek, Knott County, Kentucky, and then one at the Gander School in Letcher County, Kentucky, during the periods 1926–1927, 1930–1931, and 1933–1934. It was at Caney Creek in the summer of 1926 that she began to collect the traditions of her neighbors.

In 1932 Campbell graduated from Southern Illinois University with a bachelor's degree in education; in 1937 she received her Master of Arts in English from George Peabody College. She taught English, folklore, and creative writing at West Georgia College and Peabody College and at Alabama Laboratory School and Carrollton High School in Georgia. She also made home visits for the Kentucky Crippled Children's Commission in the summers.

A recipient of Julius Rosenwald and Guggenheim Fellowships, Campbell completed her Ph.D. in folklore and comparative literature from Indiana University in 1956. She taught at Glassboro State College in New Jersey, Bowling Green State University in Ohio, and the University of Massachusetts at Amherst. Along with numerous articles, she wrote *Cloud-Walking* (1942) and *Tales of the Cloud-Walking Country* (1958), two collections of southern Appalachian folktales; *Folks Do Get Born* (1946), a study of birthing practices based on interviews with African American midwives; and *A House with Stairs* (1950), a novel about an Alabama African American family during the Civil War. Campbell often did not publish verbatim versions of the traditional material she collected; her strength lies in her early recognition of the importance of presenting a folktale's context.

Campbell, Olive Dame (1882–1954)

Ballad collector, founder of John C.Campbell Folk School, cofounder of Southern Highland Handicraft Guild, and second executive secretary of the Council of the Southern Mountains. Though for three decades a powerful influence on social agencies working in Appalachia, Olive Dame Campbell is best known among folklorists for discovering the Appalachian ballad tradition and bringing English folklorist Cecil Sharp to collect it.

Born in Medford, Massachusetts, Campbell came to the South in 1907, when she married John C.Campbell. The following year, her husband accepted a Russell Sage grant to survey agencies working in the mountain South. She dated her interest in ballads from hearing student Ada B.Smith sing “Barbry Allen” at the Hindman Settlement School, December 3, 1908. Having gathered more than sixty ballads, she persuaded Cecil Sharp to come make a more systematic collection. On three tours, in 1916, 1917, and 1918, Sharp and Maud Karpeles spent a total of forty-six weeks. The outcome was the 1932 *English Folk Songs from the Southern Appalachians*.

After the death of her husband in 1919, Campbell succeeded to his position on the Council of the Southern Mountains and finished his book *The Southern Highlander and His Homeland*. Having spent fourteen months touring Scandinavian folk schools established on the Grundtvig model, Campbell in 1925 founded the John C.Campbell Folk School at Brasstown, North Carolina. The school and the Southern Highland Handicraft Guild, which she also helped establish, were influential in developing a distinctive southern Appalachian style in handicrafts created for the marketplace.

Camplore

The oral, customary, and material traditions found in groups camping outdoors, especially in residential summer camps for children and youths. While humans have been telling stories and singing songs around campfires for eons, American camplore is best seen as arising at the end of the 19th century, when the urbanization of the United States transformed the “outdoors” into a site for escape, recreation, and renewal. This view of the outdoors, popular at a time when Americans worried that their wilderness was disappearing, was a piece of the Progressive Era (late 1800s to 1917) ideology lying behind natural-conservation movements. Tourist camps, organized campgrounds at national parks, private hunting and fishing camps, church camps, and summer residential camps arose in the 1890s and the early 20th century, serving the recreational needs of the urban and suburban middle and upper classes. Youth movements, from the Young Men’s Christian Association (YMCA) to the Boy Scouts and Girl Scouts of America, created organized summer camps and published guidebooks aimed at assisting adults in creating campfire programs and other customs for the campers. Private summer camps for families, but especially for children, grew through the century, and in the 1950s part of a typical suburban middle-class childhood was packing off to summer camp for up to two months.

The residential summer camp, where campers live in relative isolation over a period ranging from days to months, serves as the model of an institutional setting for camplore. Campers typically live, sleep, bathe, and eat together, reproducing the experience of the homeworld and creating the sorts of intimate, shared experiences that can lead to shared folk traditions. Thus, camplore often includes the “everyday” genres and texts one finds in family folklore, such as nicknaming, personal-experience narrating, joking, and practical joking.

The nature of camplore will vary considerably, depending upon the larger purpose of the organization. Secular camps, run as businesses or as social-service organizations, will tend to create a camp culture with many of the features of American public culture. A camp sponsored by a religious organization will bring to the official camp program ideas, symbols, and activities particular to that faith. A camp sponsored by a youth organization, such as the Boy Scouts or the Girl Scouts, will bring to the camp’s official culture still a different set of public symbols, customs, and expectations. Regardless of the official agenda, campers also bring their own folk cultures and expectations to the camp experience. The resulting folk culture of any camp, therefore, owes its character to the interaction between official organizational goals and the dynamics of the folk cultures the campers bring with them.

Camps will also differ significantly by the demographic characteristics of the campers. The cultures of family camps, with a range of ages, will differ significantly from those of camps designed for a narrow age group. Single-sex camps will vary considerably from coeducational camps, just as the folk cultures of girls’ cabins will differ from the folk cultures of boys’ cabins at the same camp. Some campers might bring with them folk

traditions associated with ethnic cultures, and the effect of those traditions upon camp culture will depend upon the minority or majority status of the ethnic folk culture at the camp.

Just as in families, campers honor (and sometimes “invent”) folk customs around routine, but symbolically important, events, such as meals. An eating group might honor the tradition of waiting for everyone to finish eating before beginning dessert, but food fights (or other forms of playing with food) can be just as traditional. Campers often have special folk names for familiar foods (“bug juice” for Kool Aid) and belief legends featuring the contamination of food or drink (the story that the kitchen staff puts saltpeter in the iced tea to dampen adolescent male sexual desire).

Sharing sleeping quarters (typically tents or cabins) gives rise to traditions solidifying the smaller folk-group identity. Thus, a sleeping group might decorate their living space in some traditional way, might develop folk dress to indicate group membership, or might play traditional games. Solidarity is also tested and served by living-group traditions of joking and practical joking, which include such well-known pranks as “shortsheeting,” moving a sleeping camper, placing a sleeping camper’s hand in warm water to induce urination, and so on. The classic Snipe Hunt, in which a victim is tricked into engaging in an elaborate (and eventually humiliating) hunt for a nonexistent creature, is one of the more complex examples of camp pranks.

Campfire also includes traditions beyond the everyday. Campfire programs, for example, are usually performed at special times and in special places, heightening the participants’ sense that this activity is extraordinary. Campfire programs typically combine two or more of the following elements: songs, stories, skits, games, and contests. The songs may range from the traditional folksong or spiritual to songs written for the particular camp. Perennial favorites of the first sort include “My Darling Clementine” and “Michael, Row the Boat Ashore.” Some traditional songs (“chain songs”) permit the campers to inject into the formulaic verses new lyrics specific to the camp and the campers. Campfire stories may range from the oral performance of written stories, to the local belief legend. Local belief legends told at campfires usually are meant to frighten the younger campers, so these legends resemble adolescent urban legends in their narrative conventions. These stories of ghosts, deranged killers of campers, and others are told with the usual details of place and names meant to induce belief in the audience. Sometimes the campfire legends are of the humorous kind (“anti-legends”), beginning seriously but ending with a punch line depending upon a bad pun or a sudden movement or shout meant to frighten the listeners.

Scouts and other organizations encourage small-group skits (or folk dramas) at campfires. Campers may draw upon published versions of these skits or invent their own. Skits are meant to be humorous, but sometimes skits resemble practical jokes and the humor is at the expense of a camper who gets doused with water or suffers some other indignity. Like skits, games and contests are meant to be fun.

Interpretations of the meanings of campfire must take into account the particulars of organizational goals, gender, age, social class, ethnicity, and so on. But folklorists value campfire because the camp creates an intense, family-like setting that is more diverse than a family. Interpreters of campfire assume that the camp’s separation from routine, everyday life makes it a “safer” setting for people (especially children and adolescents) to explore what it means to be a member of a group through the stylized performances of

folklore. The camplore of children and adolescents usually displays the parody and nonsense characteristic of their other folklore, which empowers the children by providing symbolic resistance against the socializing pressures brought by adults. The content of camplore often reflects the social and psychological anxieties brought from everyday life. Thus, food-contamination jokes and campfire stories about maniacal killers roaming the woods provide young people with conventional, stylized narratives that help them deal with anxieties about their changing bodies, about safety, about abandonment, and about similar psychological matters.

Canadian Folklore (Anglophone)

English-language folklore of Canada. Until the 1950s, Canada lagged behind other countries in its study of many types of folklore. Those folklore items that existed were collections or descriptions; analysis came more recently.

The Jesuits and early explorers noted Indian beliefs, tales, and customs in their writings, and anthropologists began to study the various tribes. Such research has continued, and the native peoples are the most thoroughly researched of Canada's various ethnic groups.

Second to the wealth of Indian lore was that of the French Canadians. Visitors, travelers, early writers, and voyagers recorded French Canadian customs, tales, and songs. In 1865 Ernest Gagnon published the first major Canadian folksong collection, *Chansons populaires du Canada*. An early English report of habitant life was W.P.Greenough's *Canadian Folk-Life and Folk-Lore* (1897). Then in the early 20th century, Marius Barbeau began his pioneering work; this led to the folklore section of the National Museum of Canada with its archive of folk materials. His disciple, Luc Lacourcière, established folklore archives at Laval University, and the collection and study of French Canadian folklore flourished.

Little Anglo-Canadian lore appeared until the 20th century except folklife descriptions in diaries, autobiographies, histories, and pioneer accounts. The best known of these early books are Anna Jameson's *Winter Studies and Summer Rambles in Canada* (1839), Catherine Parr Trail's *The Backwoods of Canada* (1836), and Susanna Moodie's *Roughing it in the Bush* (1852).

The latter part of the 19th and the early 20th centuries saw some collecting, but little organized work. Early folklore societies were started but soon died out.

Some collectors—Alexander Chamberlain, George Patterson, and Alice Leeson—published a few items in the *Journal of American Folklore*, the best being Patterson's series on Newfoundland dialect (1895–1897).

In 1895 the *Family Herald* and *Weekly Star* started its "Old Favourites" song page that included some folksongs, and Newfoundlanders John Burke and James Murphy published small songbooks in the early 1900s. This indicates the genre—folksong—that was to dominate Anglo-Canadian folklore for most of the 20th century.

W.Roy Mackenzie was the first important Anglo Canadian collector. He published some Nova Scotia songs in the *Journal of American Folklore* in 1908 and 1910 and went on to describe his collecting in *The Quest of the Ballad* (1918). This is a fascinating description of how he went about his search, and of the singers from whom he got a remarkable number of songs. Later he published the first major Anglo Canadian folksong volume, *Ballads and Sea Songs from Nova Scotia* (1928). His carefully researched notes make this still an important book; he was one of the first collectors to trace broadside references.

Carrie Grover's *A Heritage of Song*, composed of items learned from her parents in Nova Scotia, is another important early collection.

Canadian folklore collecting and publishing flourished in the early 1930s. Helen Creighton, who followed Mackenzie's lead in Nova Scotia, became the first in English Canada to cover more than one genre. In addition to songs, her major field, she collected tales, superstitions, games, riddles, proverbs, and customs, assembling the largest Anglo-Canadian collection of any individual; it remained unequalled until Memorial University's folklore students began collecting in the 1970s.

Between 1932 and 1988, Creighton published ten important books—six of songs, covering not only the Anglo-Canadian but also the French Canadian and Gaelic material in Nova Scotia. Her *Bluenose Ghosts* and *Bluenose Magic* were the first major Canadian collections of beliefs and superstitions. She also published folklore of the German Canadian settlers of Lunenburg and issued two Folkways records, *Folk Music of Nova Scotia* (no. 1006), and *Maritime Folk Songs* (no. 4307). Her autobiography, *A Life in Folklore* (no. 1975), describes her long career.

When Creighton began collecting in Nova Scotia, Mary L. Fraser, a Catholic nun, was also collecting for her doctoral dissertation. Published in 1931 as *Folklore of Nova Scotia*, it gave many popular superstitions, with reports of second sight, ghosts, forerunners, fairy lore, and mermaids and stories of the devil.

Many of the early collectors in English-speaking Canada came there from Britain or the United States. An American, Arthur Huff Fauset, was collecting for his dissertation at the same time as Fraser. He worked with Nova Scotia's Black population, and in 1931 he published *Folklore from Nova Scotia*, the first, and by the mid-1940s almost the only, book about the lore of African Canadians. It contained the first large collection of folktales reported in Canada, ranging from *Märchen* through jokes, tall tales, local stories, and legends.

While these collectors were working on the mainland, two Americans and an Englishwoman were collecting in Newfoundland. When Elisabeth Bristol (later Greenleaf) came up from Vassar College in New York state to teach at the Grenfell Mission Summer School, she was fascinated by the Newfoundland singers, and she returned with a musicologist, Grace Yarrow (Mansfield), to record their songs. In 1933 Harvard published their *Ballads and Sea Songs of Newfoundland*, the first, and still one of the best, volumes from the island. (Later Greenleaf published some Newfoundland riddles in the *Marshall Review*.)

At the same time as the Vassar women, Maud Karpeles came from England to collect in Newfoundland. She was prompted to go there by the British collector Cecil Sharp, who had hoped to go himself after their 1916–1918 trips to collect southern Appalachian folksongs, but his death intervened. She published some songs with piano accompaniment in 1932, but her complete *Folk Songs from Newfoundland* did not appear until 1971. It was large but not as valuable as the 1933 Greenleaf-Mansfield book; Karpeles was interested only in the old British songs she found, and she ignored Newfoundland's rich local tradition.

An early factor that helped preserve and spread Newfoundland songs was the series of small songsters issued by Gerald S. Doyle, a St. John's merchant, who used them as an advertising device. The first appeared in 1927, followed by four editions from 1940 to 1978.

The first Canadian to investigate Newfoundland songs was Kenneth Peacock, who worked for the National Museum. Between 1951 and 1961, he made six field trips, and in

1965 he published a massive, three-volume *Songs of the Newfoundland Outports*, the largest Canadian collection to date. Much later the Newfoundland record company Pigeon Inlet issued some of these songs (no. 7319).

Another American, MacEdward Leach, spent the summer of 1960 collecting in Labrador for the National Museum, and in 1965 he published *Folk Ballads and Songs of the Lower Labrador Coast*. He collected some songs on the island that he put on a Folkways record (no. 4075), and some Celtic tales from Cape Bretoners.

Fifteen years later Shannon Ryan and Larry Small published *Haulin' Rope and Gaff: Songs and Poetry in the History of the Newfoundland Seal Fishery*, emphasizing the strong maritime tradition that Mackenzie and Greenleaf had stressed earlier. In 1985 Genevieve Lehr published *Come and I Will Sing You*, 125 songs collected in the previous decade. Awaiting publication is Kenneth Goldstein's huge collection of Newfoundland songs, amassed through repeated summer excursions to the island and Labrador.

The first New Brunswick collector was Louise Manny. Although she did not collect as extensively as Creighton, she did much to preserve the local songs. Inspired by Lord Beaverbrook, she began collecting from the Miramichi lumbermen. Soon she started a regular radio program featuring local singers, and in 1958 she launched the Miramichi Folk Festival, named for the river that was the center of New Brunswick's lumber trade. This festival was unique in North America in that it featured only traditional singers. Manny's work resulted in a book, *Songs of Miramichi* (1968), and two records, *Folksongs of the Miramichi* (Folkways 4053) and *Marie Hare of Strathadam, New Brunswidt* (Folk Legacy FSC 9). These emphasized local songs of the northern lumbermen; Helen Creighton's *Folksongs of Southern New Brunswick* (1971) has more older British ballads.

Later, Carole Spray produced a useful tale collection, *Will O' the Wisp: Tales and Legends of New Brunswick* (1979).

Prince Edward Island was neglected until Edward Ives from the University of Maine extended his collecting into the Canadian Maritimes. He published some Canadian items in journals in the 1950s and 1960s and devoted the 1963 issue of *Northeast Folklore* to "Twenty-one Folksongs from Prince Edward Island." Randall and Dorothy Dibblee published *Folksongs from Prince Edward Island* in 1973, and Sterling Ramsay published *Folklore Prince Edward Island* in 1976.

Ives found that singers in the Maine and New Brunswick woods had very similar repertoires. His Canadian collecting continued over forty-odd years, resulting in important studies of three Maritime singer-composers: *Larry Gorman: The Man Who Made the Songs* (1964), *Lawrence Doyle: The Farmer-Poet of Prince Edward Island* (1971), and *Joe Scott: The Woodsman-Songmaker* (1979). More recently he published *Folksongs of New Brunswick* (1989).

Meanwhile, in 1962, another American, Herbert Halpert, came to Memorial University in St. John's, Newfoundland, and in 1968 he founded the first, and by the mid-1990s the only, Anglo Canadian Folklore Department. He also established the Memorial University of Newfoundland Folklore and Language Archive, known as MUNFLA. At first the staff comprised scholars from the United States and Britain. Newfoundlanders were added as they graduated, but by 1995 it was still rather heavily staffed with Americans and Britishers, including Neil V. Rosenberg, Gerald L. Pocius,

J.D.A.Widdowson, David Buchan, Martin Lovelace, and Paul Smith. Canadians include Gerald Thomas, Wilfred Wareham, and Lawrence Small.

Some of MUNFLA's publications are *A Regional Discography of Newfoundland and Labrador, 1904–1972* (1975) by Michael Taft; *Folklore and Oral History* (1978), edited by Neil Rosenberg; and *Canadian Folklore Perspectives* (1978), edited by Kenneth Goldstein; the latter is a group of essays relating folklore to the search for a Canadian identity.

Since Memorial's founding, collecting and research have flourished. For the first time, folklorists have made an extensive study of the varied folklore of one region, building up a vast archive. Their most important publications so far (1995) are the first detailed study of a Canadian custom, *Christmas Mumming in Newfoundland* (1969), edited by Halpert and George M.Story; and the huge *Dictionary of Newfoundland English* by Story, W.J.Kirwin, and Widdowson (1977). Other valuable books are *Studies in Newfoundland Folklore: Community and Process* (1978), which contains sixteen essays on various aspects of tradition, edited by Gerald Thomas and Widdowson, and Colin Quigley's pioneer study, *Close to the Floor: Folk Dance in Newfoundland* (1985).

An interesting volume in the university's Folklore and Language Series is Halpert's *A Folklore Sampler from the Maritimes* (1982). It contains narratives, beliefs, dits, proverbial sayings, and childlore, collected by Mount Allison University students in Sackville, New Brunswick, when Halpert held the Winthrop Pickard Bell Chair of Maritime Studies there. It is particularly valuable for Halpert's detailed bibliographic essay on the folktale in English.

A more general series published by Newfoundland's Institute of Social and Economic Research (ISER) includes some folklore books. One of the most important is Widdowson's study of threats, *"If You Dont Be Good": Verbal Social Control in Newfoundland* (1977). Others of interest are Joseba Zulaika's *Terranove's The Ethos and Luck of Deep-Sea Fishermen*, Tom Philbrooks *Fisherman, Logger, Merchant, Miner: Social Change and Industrialism in Three Newfoundland Communities*, and Gerald L.Pocius' *Living in a Material World: Canadian and American Approaches to Material Culture*.

In 1991 ISER published Barbara Rietl's fascinating account of *Strange Terrain: The Fairy World of Newfoundland*, and Garland published Peter Narváez's compilation of *The Good People: New Fairylore Essays*, a broader international survey. The superstitions documented in those studies are treated in Gary Butler's important analysis, *Saying Isn't Believing: Conversation, Narrative, and the Discourse of Belief in a French Newfoundland Community* (1990).

Narváez collected songs of Newfoundland's Buchans miners, and Breakwater issued them on a record, *Come Hell or High Water* (1001). Breakwater also published studies of Newfoundland folklife by Victor Butler, Hilda Murray, Helen Porter, and Audrey Tizzard, and a study of Newfoundland's Scottish Gaelic traditions, Margaret Bennett's *The Last Stronghold* (1989).

The fiddle is Canada's major folk instrument, and many great fiddlers have made records. Newfoundland's Emile Benoit (Pigeon Inlet 732 and 7311), and Rufus Guinchard (Pigeon Inlet 737 and Breakwater 1002) are excelled only by Canada's greatest fiddler, Quebec's Jean Carignan (Folkways 3531, 3532, Philo 2001, 2012, 1014).

The Highland Scots who settled Cape Breton preserved their Gaelic traditions to a greater extent than Scots elsewhere in Canada. The first important study was Charles W. Dunn's *Highland Settler: A Portrait of the Scottish Gael in Nova Scotia* (1968). Later, Gaelic songs appeared in two large volumes, Donald A. Fergusson's *Fad Air Falbh As Inse Gail: Beyond the Hebrides* (1977), and Margaret MacDonnell's *The Immigrant Experience: Songs of the Highland Emigrants in North America* (1982). In 1976 John Shaw and Rosemary Hutchison collected on the island, producing two Topic records, *Gaelic Tradition in Cape Breton* and *Cape Breton Scottish Fiddle* (12TS353 and 12TS354).

Three important collections of Cape Breton tales appeared in both the original Gaelic and English translations. The earliest and most general is Calum MacLeod's *Stories from Nova Scotia* (1974). (MacLeod later coauthored *Gaelic Songs in Nova Scotia* with Helen Creighton.) The others are studies of two tale-tellers' repertoires: *Luirgean Eachainn Nill: Folktales from Cape Breton*, told by Hector Campbell and translated by Margaret MacDonnell and John Shaw (1982); and *Tales until Dawn: The World of a Cape Breton Gaelic Story Teller* (1987) by Joe Neil MacNeil, translated by John Shaw.

Meanwhile, John C. O'Donnell was studying another part of Cape Breton folklore, that of the miners. He organized a choir, Men of the Deeps, which became widely known through cross-country concerts and international tours, and aired its songs on several Waterloo records. In 1992 he published a comprehensive volume, "*And Now the Fields Are Green*": *A Collection of Coal Mining Songs in Canada*. In addition to older songs from Britain and the States, it gives many composed by the Cape Breton miners.

In addition to Nova Scotia, Scots settled in Quebec's Eastern Townships, and the National Museum published a study of them, *Cultural Retention and Demographic Change: Studies of the Hebridean Scots* (1980); it contains an important article on folktales by Margaret MacDonnell.

Except for the native collections, little folklore was reported from Canada west of Quebec until the middle of the 20th century. In 1918 the *Journal of American Folklore's* special issue had small general Anglo Canadian collections from Ontario by W. J. Wintenberg, E. W. Waugh, and Eileen Bleakney. Wintenberg also collected from the Pennsylvania Germans around Waterloo, and his *Folk-Lore of Waterloo County, Ontario* appeared in 1950. George Elsmore Reaman's *The Trail of the Black Walnut* (1957) was one of several historical accounts of this group, and an irregular journal, *Canadian-German Folklore*, started in 1961.

During the 1950s and 1960s, Edith Fowke produced documentary folksong programs on the Canadian Broadcasting Corporation (CBC), using commercial records. Audience inquiries for Canadian songs led her and Richard Johnston to compile *Folk Songs of Canada* (1954), drawing upon the collections of Greenleaf, Creighton, and Barbeau. Next they published *Chansons de Quebec/Folksongs of Quebec* (1957), which gave singable English translations of some popular French Canadian songs. *More Folk Songs of Canada* followed in 1967.

For many years, singer Alan Mills had a weekly CBC program; he made numerous records and toured extensively in Canada and the United States, doing much to make Canadian songs known. Another singer, Ed McCurdy, also had CBC programs and made some records of Canadian songs along with many American ones.

Mills and Fowke collaborated on various CBC programs, Fowke writing the scripts that Mills narrated and sang. One series resulted in a book, *Canada's Story in Song* (1965), and a two-record Folkways set (no. 3000). In 1985 Fowke updated and enlarged it as *Singing Our History*. These were designed for use in the schools.

Noting the lack of songs from west of Quebec, Fowke began looking for some in Ontario and discovered many fine singers around Peterborough: Mary Towns, Vera Keating, and Tom Brandon, among others. When she continued her collecting farther north, she found O.J. Abbott, one of Canada's finest traditional singers.

Some of the Peterborough singers appeared on *Folk Songs of Ontario* (Folkways 4005), O.J. Abbott on *Irish and British Songs from the Ottawa Valley* (Folkways 4051), and Tom Brandon on Folk Legacy No. 10.

Ontario's Scottish settlers preserved fewer songs than the Irish, although some survived in eastern Ontario's Glengarry County. The best singer there was Grace Fraser, who had a large repertoire of both Scottish and Irish songs.

In Toronto C.H.J. Snider, an authority on nautical matters, had collected many Great Lakes songs; he and Stanley Baby, whose father had been a captain on sailing ships back in the 1870s, liked to meet with other sailors and their wives for singing sessions. From them Fowke got material for *Songs of the Great Lakes* (Folkways 4018).

Most Ontario songs came from the Irish settlements in Peterborough and the Ottawa Valley, and from men who had worked in the lumber camps. Irish colonists had brought many Irish songs, and local Ontario songs described work in the camps or accidents in the woods or on the drives.

Traditional Singers and Songs from Ontario (1965) featured seven singers whose songs came mostly from the British Isles. The native Canadian songs appeared later in *Lumbering Songs from the Northern Woods* (1970) and *Lumbering Songs from the Ontario Shanties* (Folkways 4052), the first Canadian book and record devoted to one occupation. In 1973 a more general selection, *The Penguin Book of Folk Songs*, with a record, *Far Canadian Fields* (Leader 1067) gave a cross-section of Canadian songs from coast to coast.

Later Fowke collected from LaRena Clark, another good traditional singer who knew an enormous number of songs, with many rare ones. *LaRena Clark: Canadian Garland* (Topic 12T140) and *A Family Heritage: LaRena Clark's Story and Songs* (1993) document some of these.

From songs, Fowke went on to collect children's lore, publishing *Sally Go Round the Sun: 300 Games, Rhymes, and Songs of Canadian Children*, with a record, in 1969; *Ring around the Moon: 200 Songs, Tongue Twisters, Riddles, and Rhymes*, in 1977; and *Red Rover, Red Rover: Children's Games Played in Canada*, in 1988.

She also compiled several general anthologies. *Folklore of Canada* (1976) is a collection of folklore items grouped as "The Native Peoples," "Canadians," "Anglo-Canadians," and "Canadian Mosaic"; it gives tales and songs from all groups, plus parlor games, foodways, riddles, jokes, square-dance calls, autograph verses, vernacular speech, and folkways.

Folktales of French Canada (1982) gives English translations of tales from Barbeau's "Contes populaires canadiens" in the *Journal of American Folklore* between 1916 and 1940. *Tales Told in Canada* (1986) is a selection of Indian myths, animal tales, Märchen, jokes, anecdotes, formula tales, legends, and personal-experience narratives from a

variety of sources. Oxford Press published Fowke's general survey, *Canadian Folklore*, in 1988.

Roy Clifton, an Ontario dance caller, recorded three records of square and other folk dances with a local group (Folkways 8825, 8826, and 8827).

Sheldon Posen collected extensively among the Irish Canadians around Chapeau, Quebec, and published a book about their best known song "The Chapeau Boys" in 1988.

Pauline Greenhill has researched and written of family photographs, folk drama, mock weddings, and shivarees. Her most important work to date (1995) is a study of recitations in a community context, published as *True Poetry: Traditional and Popular Verse in Ontario* (1989).

Ontario customs and folk arts and crafts are documented in many books and articles. Mary-Lou Patterson and Michael Bird have published extensively on the art of the Mennonites around Waterloo; Katherine B. Brett described women's costumes in early Ontario; Dorothy and Harold Burnham have written of quilts, textiles, and handweaving; and Edna Staebler describes the Mennonite foodways in several books, beginning with *Food That Really Schmecks* in 1968.

Edwin C. Guillet's *Early Life in Upper Canada* (1933), John Kenneth Galbraith's *The Scotch* (1964), and John J. Mannion's *Irish Settlements in Eastern Canada* (1974) are useful studies of folklife.

Because western Canada was settled later, collecting there has been, and still is, very spotty. Before the 1940s, the only publications were some limited studies of minority groups, place-name collections, and articles, pamphlets, and books of pioneer life. Since then a few more significant items have appeared, although the coverage of Anglo Canadian material is still poor. Most collecting in the four western provinces has been of other ethnic groups.

Among the limited publications dealing with English or French is Kay Stone's *Prairie Folklore* (1976), which she assembled from her students' papers at the University of Winnipeg. As she notes, it is "an extensive gathering of recent material from Manitoba, from simple children's skipping rhymes to lengthy fairy tales."

In the 1960s Barbara Cass-Beggs published *Eight Songs of Saskatchewan*, and Seven Metis *Songs of Saskatchewan* with translations. More recently Robert Cosbey wrote an excellent small book, *All in Together, Girls: Skipping Songs from Regina, Saskatchewan* (1980), and Michael Taft wrote *Discovering Saskatchewan Folklore: Three Case Studies* (1983), discussing a storytelling session in a rancher's home, a pilgrimage to a shrine at St. Laurent, and lace making in a Belgian family.

In the *Alberta Historical Review* (Autumn 1962), John C. Higinbotham described "Western Vernacular" as he heard it in the 1880s. Grant McEwen published books of prairie farming and ranching. He also produced *Eye-Opener Bob* (1957), the story of the legendary Robert Chambers whose one-man paper, the *Calgary Eye-Opener* (1901–1922), won him fame as a prairie Mark Twain.

In Alberta and British Columbia, folklorists have reported many tall tales. An American, Robert Gard, published a short-lived *Alberta Folklore Quarterly* in 1946–1947, and a book, *Johnny Chinook: Tall Tales and True from the Canadian West*; Herbert Halpert collected "Tall Tales and Other Yarns from Calgary, Alberta," when he was stationed there during World War II; and Michael Taft published *Tall Tales of British Columbia* in 1983.

The most significant Anglo Canadian book from the western provinces to date (1995) is *Songs of the Pacific Northwest* (1979), which Philip J. Thomas collected and researched; it contains some songs from oral tradition and some found in archives, with detailed notes relating the songs to British Columbia's history.

Canada is a multicultural country, and the National Museum's Canadian Centre for Folk Culture Studies has assembled folklore materials from more than fifty different groups. Apart from those whose native language is English or French, the three largest groups are the Pennsylvania Germans, the Ukrainians, and the Doukhobors.

The major Pennsylvania-German settlement was in Ontario; most of the other ethnic groups settled in the west. The Ukrainian Canadians first came out to Manitoba in the 1890s and were followed by others after World War I and later. In Manitoba, by far the largest number of publications have featured Ukrainian songs and tales. Florence R. Livesay published a pioneer volume, *Songs of Ukraina*, in 1916. In 1958 J. Dzubko published *My Songs: A Selection of Ukrainian Folksongs in English Translation*. J. B. Rudnyc'kyj made an extensive collection of Ukrainian folklore, *Ukrainian-Canadian Folklore: Texts in English Translations*, and compiled two volumes of *Readings in Canadian Slavic Folklore* (1961).

The National Museum (which later became the Canadian Museum of Civilization) contracted for and published many books on ethnic communities, mostly from the West. In 1970 it published Robert B. Klymasz's *The Ukrainian Winter Folksong Cycle* and *The Ukrainian Immigrant Folksong Cycle in Canada*, and in 1973 *Folk Narrative among Ukrainian-Canadians in Western Canada*, Canada's first major collection of folktales.

Other important folklore publications were Kenneth Peacock's *Twenty Ethnic Songs from Western Canada* (1965), *Songs of the Doukhobors* (1970), and *A Garland of Rue: Lithuanian Folksongs of Love and Betrothal* (1971).

Papers on folkways in the museum's mimeographed Mercury Series include Rolf W. Brednich's *Mennonite Folklife and Folklore* (1977), Robert Blumstock's *Bekevar: Working Papers on a Canadian Prairie Community* (1979), and Linda Dégh's *People in the Tobacco Belt* (1975).

More specific topics were Charles Sutyas *The Finnish Sauna in Manitoba* (1977), Ban Seng Hoe's *Structural Changes of Two Chinese Communities in Alberta* (1976), Gordon Cox's *Folk Music in a Newfoundland Outport* (1979), and Gerald L. Pocius' *Textile Tradition in Eastern Newfoundland* (1979). Ellen Karp edited *Many Are Strong among the Strangers* (1984), a collection of Canadian immigrant songs. A more important publication was Carole Carpenter's *Many Voices: A Study of Folklore Activities in Canada and their Role in Canadian Culture* (1979), a lengthy general survey and analysis.

Many works deal with folk art and material culture. Jean Francois Blanchette, Rene Bouchard, and Gerald L. Pocius compiled a useful bibliography of "Folk Material Culture in Canada, 1965-1882" for *Canadian Folklore canadiens* special issue, "People and Things" (1982). A few outstanding books it lists are David Zimmerly's *Contextual Studies of Material Culture* (1978), Michael Bird's *Canadian Folk Art: Old Ways in a New Land* (1983), and *From the Heart: Folk Art in Canada* from the National Museum.

The first *Bibliography of Canadian Folklore in English* (1981), edited by Fowke and Carpenter, is fairly complete up to 1980. The bibliographies in Fowke's *Canadian Folklore* (1988) are smaller but somewhat more up-to-date.

Fowke and Carpenter also collaborated on *Explorations in Canadian Folklore* (1985). It contains some analytic articles: Barbara Kirshenblatt-Gimblett's study of Montreal's Jewish community, "A Parable in Context"; Robert Klymasz's report on the ethnic joke; and Carole Carpenter's "The Ethnicity Factor in Anglo-Canadian Folkloristics."

Folklore Studies in Honour of Herbert Halpert (1980), edited by Goldstein and others, contains articles on a wide variety of subjects.

Canada's two major folklore organizations are the Canadian Folk Song Society, which Barbeau organized in 1960; and the Folklore Studies Association of Canada, launched in 1976. They started the two major folklore journals: the annual *Canadian Folk Music Journal* in 1971 and *Canadian Folklore canadien* in 1979. Both societies publish quarterly bulletins. Also important is *Culture and Tradition*, published annually by Laval and Memorial students since 1976.

The journal *Ethnomusicology* had a special Canadian issue in September 1972, *Canadian Ethnic Studies* had a special issue on "Ethnic Folklore in Canada" in 1975, and the *Laurentian University Review* featured "Folklore and Oral Tradition in Canada" in February 1976.

The Canadian Folk Music Society recently joined with the Canadian ethnomusicologists to become the Canadian Society for Music Traditions (CSMT). Its most useful function is operating a CSMT Mail Order Service (#510, 1701 Centre St. NW, Calgary, Alberta, T3E 8A4) whose folk-music catalog lists more than 300 records (CDs, cassettes, and LPs) and books of Canadian folk music.

Canadian Folklore Scholarship

Study of folklore in Canada. There is a distinctive pattern to the folklore studies of and in Canada that reflects more the unique geographical and historical factors that have strongly influenced the nation's economic, political, and cultural development than intellectual trends or imperatives derived from within the discipline itself. The scholarship is decidedly selective in genres and groups studied and, despite its relative abundance, continues to have little impact on either cultural scholarship and policies in most of Canada or the field of folklore around the world.

The preponderance of folklore scholarship concerns that part of Canada east of the head of the Great Lakes—that is, the oldest in terms of settlement and the richest in the traditional lore associated with distinctive subsistence-oriented, conservative and inward-focused groups, or folk. Especially in Quebec and Newfoundland, where large numbers of people lived effectively as peasants long into the 20th century, local culture was identified with folklore until well past World War I. These circumstances drew foreigners seeking folk traditions to the region to study them and prompted the local intelligentsia aiming to foster identity or achieve sociopolitical goals to focus attention upon them. The resultant valorization of folklore is evident in the academic folklore programs that exist only within this area and in the significance of folklore to the cultural politics not only of Quebec, but also of fishermen, Gaelic speakers, and other cultural groups within the region.

West of the Great Lakes and in the northern territories, native traditions continue to dominate the scholarship as they did to the virtual exclusion of most other folklore until 1971, when multiculturalism became Canada's official cultural policy and work on a diversity of groups became a sociopolitical necessity. Some groups had earlier produced scholars of their own traditions (such as Jaroslav Rudnyč'kyj and Robert Klymasz among the Ukrainians), but cultural outsiders (including many foreign scholars) are responsible for much of this multicultural work.

Franz Boas was particularly influential in focusing attention on Canada's West, especially the Northwest Coast natives, which he and his followers studied intensively. With the postcolonial demand for reclamation of voice, more of the scholarship throughout Canada is the work of native people or close collaborations sought by them (for example, Wendy Wickwire's work with Harry Robinson to produce *Write It on Your Heart* [1989] and *Nature Power* [1992]). Cultural politics is, then, a key influence on the direction and focus of contemporary scholarship.

The greatest strength of Canadian folklore scholarship is that concerned with French Canadian traditions, which has a breadth, depth, and cultural significance unmatched by any work elsewhere in Canada. Virtually every genre, from folk language to children's toys, costume to belief, is represented in the literature—an exception to the general pattern in the country. The impact of this extensive scholarship on the field of folklore is somewhat limited owing to language and the insularity of many Quebecois scholars who have connected more with other Francophone cultural scholars than with the mainstream

North American and international folklore movement. A preservationist tendency toward collection and a longstanding political activism through culture have combined to encourage collection in preference to theoretical studies, resulting in extraordinary archives, admirable catalogs and numerous published collections. French Canada has not produced much in terms of scholarship seminal to the evolution and development of the broader discipline, but then, neither has Canada as a whole.

Few Canadians number among the key figures in folklore over time (among, for example, the Fellows of the American Folklore Society). One major contemporary scholar, Barbara Kirshenblatt-Gimblett, retains Canadian citizenship despite decades of American residence and includes Canadian material within her studies of Jewish traditions. Canada and Canadian folklore have been significant to the work of numerous prominent scholars, including Boas, MacEdward Leach, Herbert Halpert, E.D.Ives, J.D.A.Widdowson, David Hufford, and Kenneth Goldstein.

The next greatest strength of the Canadian works rests in collections and descriptive works of musical traditions (almost exclusively song or fiddle music), primarily produced by foreigners (including Maud Karpeles, Elisabeth Greenleaf and Grace Y.Mansfield, N.N.Puckett, as well as Leach and Ives) or other outsiders to the traditions they specifically studied (such as Kenneth Peacock in Newfoundland and Helen Creighton among rural Nova Scotians).

Until recently, it was most typical of Anglo Canadian folklorists to focus attention on groups outside their own, so that the mainstream traditions are still neglected in the scholarship and undervalued in the culture, a circumstance reflected in the absence of national texts and analyses or scholarly compendiums comparable to the *Oxford Companion to Australian Folklore* (1993). Works on Canadian traditions (including many of Edith Fowke's books such as *Sally Go Round the Sun* [1969] and *Tales Told in Canada* [1986]) generally target a popular readership. The best of majority-group Anglo Canadian studies are focused works on a genre or aspect of tradition (such as Pauline Greenhill's *True Poetry* [1989] on folk and popular verse in Ontario or Fowke's much earlier *Traditional Singers and Songs from Ontario* [1965]).

Many genres are virtually absent from the historical studies (for instance, riddles, proverbs, dance, and instrumental music apart from fiddling), and others are present but maligned (particularly legend). Contemporary work by ethnomusicologists and dance ethnographers addresses the paucity of thorough scholarship on traditional music and movement and also applies the studies to cultural problems (for example, the dynamics of heritage cultural instruction in multicultural milieus). Owing to the prominent role of historians as interpreters of Canadian culture, cultural scholars long actively ignored legend and personal/community narrative in favor of genealogy and other documentable accounts. Helen Creighton's most popular (and arguably her best) work, *Bluenose Ghosts* ([1957] 1976), probably reinforced rather than countered this negative attitude through its concentration on supernatural legend. Much recent work by oral historians, a certain emphasis on the contemporary legend at Memorial University in St. John's, Newfoundland (especially the work of Paul Smith and Diane Goldstein), and individual fine studies such as Gary Butler's *Saying Isn't Believing* (1990) have contributed to a greater appreciation of oral narrative generally, particularly legend.

Material-culture traditions, formerly the province of antiquarians and collectors, are now the subjects of solid academic study (for instance, studies of textile traditions, folkart

sculpture, and painting). The establishment of the Textile Museum in Toronto, the material culture studies emphasis at Memorial, and a national journal, *Material History Bulletin*, were significant steps to giving folk life studies academic credibility. Strong earlier work by architectural historians (such as Alan Gowans, *Building Canada* [1966]) had included substantial structures of interest to folklorists, but much tangible heritage of common Canadians remained ignored until recently.

Simultaneously a significant strength and a serious recent problem in scholarship is the emphasis on multiculturalism, especially as it has influenced the Canadian Centre for Folk Culture Studies (CCFCS). The demand to show appropriate scholarly interest in the diversity of Canada's population following the adoption of official multiculturalism led the CCFCS to contract numerous studies of the traditions among various cultural minorities. These studies emphasized the retention of imported traditions rather than their interaction with and adaptation into a Canadian cultural milieu. Much data—oral and material—were collected and are important in mounting the many multicultural exhibitions at the new Museum of Civilization in Ottawa (formerly the National Museum of Canada), such curatorial work now being the primary occupation of the CCFCS staff. The contribution to folklore scholarship of this multicultural research has been limited, though, since it was not connected with the ongoing international movements in applied and public folkloristics and cultural conservation. Nor has the scholarship impacted significantly on the development of multicultural theory or methodological approaches for studying or interpreting multicultural milieus. Further, with few exceptions, the studies were product- rather than process-oriented and, since they were not matched by comparable study of mainstream Canadian traditions, did more to serve political ends than the development of cultural studies in the country.

Such a pragmatic approach to folklore tends to underlie much of its serious study, at least that done by Canadians or supported by Canadian institutions. Given the prevailing elitist, product-oriented definition of culture combined with an association of folklore with marginal or delimited groups, folklore scholarship tends to remain neglected except when and where it is directly associated with a sociopolitical imperative. Consequently, traditions of the mainstream have not been collected systematically because it was never politically necessary or, more recently, politically correct to do so. The central folklore-studies organization responded to political need rather than scholarly direction. Typically, it has reacted to cultural legislation rather than forging ahead intellectually, with the result that it has never been at the forefront of the discipline and has neither political clout nor scholarly presence. That is not to say that individuals and the institution have not had influence; quite the contrary.

Once termed "The Dean of Canadian Folklorists" and certainly the single most influential scholar of folk traditions in Canada, Marius Barbeau profoundly affected the nature of Canadian folklore scholarship through his position as director of the National Museum's folklore activities (and eventually of its Folklore Division, the precursor to the CCFCS) as well as through the prodigious work he instigated on French Canadian and native traditions. From the eight Canadian numbers of the *Journal of American Folklore* Barbeau edited (between 1916 and 1950), through the financial assistance and collegial support he offered and the political and cultural connections he brokered, Barbeau orchestrated much of the Canadian research (almost all of Helen Creighton's work, for instance). A prolific writer, an avid collector, and a powerful personality, Barbeau was

yet not a truly meticulous scholar of the modern scientific anthropological school. Consequently, he was unable throughout his long career to engender much academic respect for folk material and its study within the broad scholarly community outside of Quebec.

A most notable characteristic of the scholarly work on folklore in Canada is the extent to which it lacks an academic base. Folklorists such as W.Roy Mackenzie left Canada in the early years of the 20th century to find academic employment, a trend that continues. A significant proportion of the most prominent Canadian folklorists have not been associated with academic institutions (for instance, Louise Manny in New Brunswick) or have had rather limited connections (such as Creighton's position as dean of women at King's University in Halifax) that relied more on personal associations (such as Marius Barbeau's with Luc Lacourcière at Laval University) than actual scholarly affiliation. Only where folklore has been directly linked to specific cultural studies has the scholarship developed much beyond marginality in academe. The inclusion of folklore and ethnology within le Centre d'études sur la langue, les arts et les traditions populaires des francophones en Amérique du Nord (CELAT) at Laval ensures the academic legitimacy of studying folk culture as part of *la patrimoine*, a matter of considerable consequence in the ongoing struggle for Quebec independence. Similarly, interest in promoting Newfoundland studies at Memorial University led to the hiring of Herbert Halpert in 1962 to establish the folklore program and archive, now the largest in the Commonwealth. Le Centre d'études acadiennes at l'Université de Moncton likewise was born (in 1970) out of sociopolitical circumstances that dictated a focus on local folk traditions, considered to be underappreciated and threatened by the mainstream culture and, therefore, singularly important to the process of effecting social and political change. Elsewhere in Canada, folklore remains largely an academic frill with little perceived probability for development except, possibly, in interdisciplinary area or group-oriented studies.

The establishment of the Folklore Studies Association of Canada in 1975 and its journal, *Canadian Folklore canadien*, was a hopeful sign for scholarly folklorists. The organization has raised the academic profile of folklore through meetings with the Learned Societies of Canada and some limited lobbying of government funding groups and university departments. However, no significant increase in academic positions for folklorists has ensued, and the organization has failed to protect a separate category and juries for folklore fiinding from the Social Science and Humanities Research Council, the primary agency for such academic funding in Canada. Outside of Quebec, there is effectively no public employment for scholars trained in folklore studies nor much hope of there being any in the foreseeable future—a sure sign of the inertia within the discipline and its continuing rather limited status in Canada.

Canadian Studies and Folklore

Study of folk traditions shaped by experiences and settings in Canada. Within the context of Canadian studies, folklore does not figure prominently either as a discipline or as an aspect of culture. Yet, interest in folklore throughout the country over time directly reflects a concern with identity of immediate relevance to Canadian studies.

Academic concern with folklore in Canada predates any Canadian-studies movements, in that scholarly interest in folk speech was important in the rise of French Canadian nationalism in the decade preceding the rebellions of 1837 in both Upper and Lower Canada. Folklife as well as the lore was intertwined with the Romantic nationalism prominent in Quebecois intellectual life throughout the remainder of the 19th century, with the direct consequence that such material has, until quite recently, been equated primarily with *les Canadiens*, or the native peoples.

Inasmuch as study of that which is *in* Canada may be termed Canadian studies, there is a case for the centrality of folklore based upon studies of Canada's First Nations. From the records of the Jesuit and other missionaries through exploration accounts, travelers' journals, and eventually ethnographic studies, the oral traditions of the indigenous people loom large in the literature. Postcolonial discussions devalue much of this material, yet, whatever its failings, it certainly succeeded in focusing attention on folklore as survivals—cultural remnants of a doomed race or, in the case of the French Canadians, remembrances of a backward, peasant existence.

The Anglophone intelligentsia (primarily in Upper Canada [Ontario after 1867] and the Maritimes) conceived of folklore in a decidedly British and cultural-imperialist mode. In the minds of this ruling elite, such material was necessarily connected with underdeveloped and uncultivated people. Hence, it was not to be revered and studied as primary documentation of pioneer times, but to be overcome and discarded in favor of *real* (that is, high) culture. Nationalism smacked liberally of colonialism, and a colonial mentality flourished whereby people generally believed that the best in anything was not to be found in Canada; therefore, what was in Canada could not be valorized. Consequently, colonial traditions merited little attention and definitely no dedicated scholarly attention.

The first blossoming of Canadian nationalism—the Canada First movement founded in 1868—involved and stimulated the high arts, inspiring the Confederation poets prominent in the latter half of the 19th century and, by extension, the landscape artists known as the Group of Seven, who achieved an iconographical position in the Canadian imagination soon after their first exhibition in 1920. Folklore was, if anything, denounced except for a brief period at the turn of the century in Ontario under the influence of David Boyle, the first archaeologist with the Ontario Provincial (later Royal Ontario) Museum and a powerful figure in the Canadian intellectual community. An immigrant from Argyllshire, Scotland, Boyle recognized the significance of folklore in his own life and argued for its serious study and preservation. As a result, in 1908 he and a small congenial group founded the Canadian Folk-Lore Society (modeled after the Folk-Lore

Society in Britain and destined to die with him in 1911). Boyle also wrote and lectured on folklore to the erudite and used a popular medium (a newspaper column) to reach a wider audience, the foundation of a recurring pattern in Anglophone Canada. Further, Boyle proclaimed the necessity of developing a national consciousness through folklore and, to this end, wrote the text for the young country's first color-illustrated children's book, *Uncle Jim's Canadian Nursery Rhymes for Family and Kindergarten Use* (1908). Commonly dismissed as doggerel, the verses are blatantly nationalistic and heavily influenced by folk (mainly Scots) tradition while antithetical to children's own folklore owing to their overt didacticism.

This period witnessed the rise in eastern Canada of regional studies based around folklore. Marius Barbeau began his monumental work on French Canadian tradition, concentrating on song, and nurtured a band of dedicated collectors, chief among whom was E.-Z. Massicotte. Scholars *In Quest of the Ballad* (to use the title of W. Roy Mackenzie's 1919 book documenting his part in this intellectual phenomenon) began to search out the Maritimes and Newfoundland, producing publications that entrenched folklore in the scholarly study of those regions while perpetuating the mainstream Anglo-Canadian idea of folklore being the property of others, not themselves, denying folklore any centrality in the study of the national Canadian culture, which, general opinion had it, had yet to develop.

Imperial concerns preempted much focus on Canada within the scholarly community through the first two decades of the 20th century. Following World War I, the impact of immigration necessitated an approach to Canadian culture and its study recognizing the (essentially folk) traditions maintained by the many immigrants. A surge of interest in folklore ensued, influenced by the national music theory popular in 19th-century Europe and the Romantic nationalism revolving around folk traditions in many countries at the time that, like Canada, were young as nation states (Finland, Germany, and Ireland, for example). Folklore became linked through public policy and in the popular culture with the newcomers in our midst: It was a means to develop links among all Canadians as well as a way to showcase the contribution of immigrants to the emerging culture. J. Murray Gibbon, general publicity agent for the Canadian Pacific Railway, organized a series of festivals, held at the railway's famed hotels during the late 1920s, expressly to celebrate diversity and promote unity among Canadians through mutual appreciation of tradition. He thereby established the pattern for a parade of such events that continues to the present despite growing opposition from minority-group members and mainstream Canadians alike to this "song and dance" approach to culture (see Bissoondath 1994; Hryniuk 1992). Gibbon, along with Barbeau and the important Canadian musician, Sir Ernest Macmillan, strived for cultural cohesion through the supposed international language of music—Gibbon and Barbeau published books of song for Canadians to sing; Macmillan and Barbeau collected together; and Macmillan arranged folk music to be performed that, through his prominence, found its way into most Canadian classrooms and, therefore, into the Canadian sensibility in the 1930s through the 1950s.

Easily to mid-century, in scholarly circles, Canadian studies meant almost exclusively history and literature except in Quebec, where folklore was entrenched at Laval University with Luc Lacourciere's appointment there in 1944. The prevailing approaches to these dominant studies were antithetical to folk traditions, emphasizing constitutional and legislative history and the British connections of Canadian (as a colonial) literature.

Broader cultural concerns moved into the purview of Canadian studies as a result of several federal studies, beginning with the Royal Commission on National Development in the Arts, Letters, and Sciences (known as the Massey Commission) which in 1950 reported significant Canadian accomplishment to that point (especially in the visual arts) worthy of recognition and study. Canadian institutions subsequently focused more on national production, one significant example being the folksong programming on the national public radio, the Canadian Broadcasting Corporation (CBC), which was Edith Fowke's inaugural folklore work.

As Canada approached its 1967 centennial, interest in things Canadian heightened along with a demand for cultural symbols with which to identify and products to exhibit. This search into "Canadianness" coincided with the Royal Commission on Bilingualism and Biculturalism. Originally charged in 1963 with reporting on the state of, and means to promote, bilingualism and biculturalism in the country, the commission produced a massive report that was directly responsible for the creation of Canada's multicultural policy. One immediate consequence was an increased evidence of both study and display of minority-group traditions throughout the culture. Folklore work blossomed; the staff at the Canadian Centre for Folk Culture studies mushroomed. Canadian studies, which had been growing in academic institutions, embraced ethnic studies, which necessarily involved folklore studies. A major journal, *Canadian Ethnic Studies*, produced a special issue on "Ethnic Folklore in Canada" edited by Robert Klymasz in 1975. More post-secondary universities across the country sought folklorists.

Yet another spur to the development of folklore within Canadian studies was the 1976 report of the Symons Commission on Canadian-studies (1972–1974), *To Know Ourselves*, which specifically recommended the establishment of many more folklore courses throughout the nation. Several Canadian-studies programs (such as those at Mt. Allison University, Trent University, and the University of Waterloo) subsequently hired folklorists.

The Folklore Studies Association of Canada, (FSAC), incorporated in 1975, first met in June 1976 at the Learned Societies of Canada annual meeting and subsequently joined the Learned Societies in part to raise the profile of folklore studies within Canadian studies generally. A greater presence for folklore came from the FSAC's lobbying effort, but even more from its journal, *Canadian Folklore canadien*, which enjoys a fine reputation and good circulation.

The Association for Canadian Studies regularly welcomes presentations by folklorists and, in 1986, devoted a special extended section or "Dossier," of its *Newsletter* to "Canadian Folklore Studies." In 1990 the Association for Canadian Studies in Australia and New Zealand requested its premier panel on folklore, The Leading Edge: Folklore Studies in Contemporary Canada, involving Carole H.Carpenter, Ronald Labelle and Gerald L.Pocius. This and similar connections have furthered scholarly links among Canadianists as well as folklorists.

Folklorists have held two research chairs in Canadian Studies: Herbert Halpert, the Winthrop Pickard Bell Chair at Mt. Allison University in New Brunswick (1979–1980), and Carole H.Carpenter, the John P.Robarts Chair at York University in Toronto (1994–1995). Given the few endowed positions in Canadian studies, this recognition of folklore studies is particularly indicative of its growing acceptance in Canadian academe generally.

Folklore programs and courses are threatened by the financial situation and consequent retrenchment throughout Canadian academe. The interdisciplinarity of both folklorists and their studies protects them within some programs, but the contemporary situation for folklore in Canadian studies is further vexed owing to cultural politics in Canada and the threat of Quebec separatism. The decrease in funding by major government agencies necessitated by fiscal restraint has eliminated special juries for folklore projects and thereby diminished the discipline's presence in the cultural bureaucracy. Multicultural projects have faced similar reduction in funding, especially given the intense debate over the validity of bolstering heritage traditions of minorities to the detriment of facilitating their access to the mainstream. Formerly the bastion of multicultural folklore studies, the Canadian Centre for Folk Culture Studies operates primarily as a repository and springboard for mounting exhibitions, sponsoring only that research directly required for specific exhibits.

The possibility of Quebec's separation from the rest of Canada poses a significant intellectual problem involving redefinition of the culture. If, as is sometimes argued, Canada is evolving into the first postmodern borderless state rather than merely disintegrating, then its nature as a collective of communities held together by a distinctive national sensibility will favor folklore studies.

The focus in neither of Canada's postgraduate folklore-studies programs reflects a nationalistic orientation. Scholars at Laval have always concentrated on Francophone North Americans, showing little interest in comparative or intercultural analysis involving other Canadians. Combined with a majority of Canadian Francophones among the scholars, this inward orientation encourages the social application of folklore, heightening appreciation of the material and its study as significant to the culture. The program at Memorial University of Newfoundland originally aimed at involving substantial numbers of native Newfoundlanders studying regional traditions, but over the years it has taken on an increasingly international character that directs attention further away from Canadian folklore and its study. Public-folklore activities have not, as a result, grown out of this academic base.

Changes in the public perception of Canadian culture must precede any appreciable alteration in the position of folklore within Canadian studies: An acceptance of grass-roots culture, of culture as a way of life, of intangible heritage as significant must become part of the cultural concept. The Ontario Heritage Policy Review (OHPR) (1987-1990) proposed such a redefinition as a key aspect of *A Strategy for Conserving Ontario's Heritage* (the report of the OHPR, 1990), but by 1995 the proposed policy had not been enacted.

Given the state of flux in Canada, the nature of Canadian studies is bound to change. Folklore has occupied a certain position within Canadian studies to date; its importance will most likely increase in the future, whatever happens to the country.

Canal Lore

Traditions associated with waterways dug across land to facilitate transportation. The push for canal construction in the United States in the 19th century came from growing American trade and agriculture. The Erie Canal in New York, completed in 1825, made the Great Lakes accessible to ships from the Atlantic Ocean. It also established New York City as the commercial and financial center of the nation. The success of the Erie Canal led to a boom in canal construction in the Middle Atlantic States and the Great Lakes region. However, starting in the 1830s, the railroad began to take the place of the canal as the major carrier of goods in the United States. Canals declined because shippers could move goods faster by railroad than by canal.

When canals were in their prime, they were not restricted to the carrying of freight. For the business of transporting passengers, special boats called “packets” were constructed. In addition to freight boats and packets, there were departmentstore boats, showboats, and missionary boats.

In the early days, canals offered a chance for adventure and for travel. Many colorful characters—including farm workers, loggers, and adventurers of all sorts—were attracted to a lifestyle characterized by its lack of customary restrictions. Far from home, heavy-drinking canal boaters could do as they pleased without incurring the disapproval of their neighbors. Because of the frequent feuds and fighting, early canallers acquired a reputation for rowdyism. However, with the passage of time, things settled down to a more commonplace existence.

A typical canal barge might have an owner-captain who would be assisted by his wife, who ran the galley, and a mule tender, plus a boy who helped with the mules that pulled the barge from the towpath. Mules set the pace for progress along the canal; twenty-five miles a day was a fair rate. Mules were ideally suited for the work; they were long lived and sure footed. They also had great powers of endurance; twelve-hour days were common in the industry, and it was generally a six-day week, with only Sundays off.

The work of the canaller had a definite annual cycle. In November the boat captain would begin to prepare for laying up for the winter. He would want to get his boat out of the water before freeze-up, which could damage the boat. By Thanksgiving the canal would already be closed for the winter, so both the Thanksgiving and the Christmas holidays were observed at home, not on the canal. Necessary repair work could be done during the winter.

In the spring, canal boaters would get their equipment in order for the long, productive summer boating season. Memorial Day was a well-observed holiday with picnics and get-togethers. The Fourth of July was celebrated with parades and fireworks at the small towns along the canal. Gradually, summer would turn to fall, and the cycle would be repeated.

Some folklorists and oral historians have collected workexperience narratives from old canallers. These reminiscences of the past are typically first-person accounts replete with hearsay, rumor, and gossip. The old canal boaters relate stories of harassing apprentices,

surviving floods, thwarting crimes, tricking weighmasters, avoiding missionaries, and breaking in mules.

More structured than the work-experience narratives are the tall tales, which were very popular among the canal boaters. The tall tales are often based on the boasting accomplishments of strongman heroes overcoming remarkable obstacles. The collected legends show that many canallers feared the dead and believed in spirits. Legends grew out of local tragedies, curious shapes of natural scenery along the canal, and from encounters with outlaws.

Sad to say, most projects to collect canal folklore were launched in the 20th century after canals had already declined. Although our knowledge is sketchy, we do know that some of the canallers carried fiddles, accordions, banjos, and harmonicas on their boats. After a long trip, they could relax and enjoy homemade music. In addition to making music on Sundays, their regular day of rest, canal boaters did have other occasional leisure opportunities. They might be able to make music on a weekday when their boat was tied up at a dock to be loaded, or because there was some obstacle to navigation blocking their passage.

Whenever possible, they would stop off at a canal-side saloon to have a few drinks, play the fiddle, and sing some songs. The songs grew out of their work environment. For example, there were many bridges passing over a canal to permit farmers to cross from one side to the other. Typically, these bridges were very low. If a canaller were inattentive, he might get a bump on the head. The mule driver was supposed to call out "Low bridge!" to warn the others when he spotted a bridge. This helps explain the refrain from "The Erie Canal," America's best-known canal folksong: "Low bridge, ev'rybody down!/Low, bridge, for we're going thru a town."

The canal ballads come largely from the second half of the 19th century, and they have all of the stereotyped attitudes and situations of that genre. One well-known ballad tells of an ill-fated romance between a mule driver and a lock tender's daughter. Another tells of a jealous lock tender who murdered his wife for her affair with a canal boatman. Still others deal with haunted houses along the canal, fights, and stabbings.

Though the Golden Age of the canal has come and gone, it has not been entirely forgotten. Some American communities along the once mighty canal system, having restored portions of their original canals along with the associated structures, hold nostalgic annual festivals to commemorate that earlier era. Such festivals typically feature a mix of music, crafts, and canal rides. They may also present historical and educational exhibits. A particularly effective exhibit is the actual construction of a canal boat, with the boatbuilder and crew on hand to discuss work on the boat and answer questions for festival goers.

Cansler, Loman D. (1924–1992)

Collector of Midwestern folklore and folksong, scholar, and traditional singer. Cansler was born in Dallas County, Missouri, into a family of singers and music lovers. He served in the U.S. Navy during World War II and entered the University of Missouri in Columbia in 1946, without, as he later wrote, the benefit of a high school education. Exploring the university library, he soon discovered that among the songs published by H.M.Belden in *Ballads and Songs Collected by the Missouri Folk-Lore Society* and Carl Sandburg in *The American Songbag* were many he had heard his family and neighbors in Dallas County sing. While still at the university, he began collecting folklore and folksongs from his family and fellow students and researching the origins of the songs.

After receiving a B.S. from Missouri in 1949 and a master's in education in 1950, Cansler became a high school teacher and counselor, first for two years in Fayette in central Missouri and later in north Kansas City. He acquired a tape recorder in 1954 and for a number of years spent summers camping with his family to seek out traditional songs and other folklore, working primarily in Missouri but also collecting in Kansas, Illinois, and other Midwestern states. He spent a summer at the Indiana University Folklore Institute in 1962, and in 1968 he represented Missouri at the National Folklife Festival in Washington, DC.

One of Cansler's primary interests was songs by known authors, particularly those originating in his native state, and he documented the lives and work of several Missouri song-writers. His contributions to folksong and folklore research in the Midwest were substantial and include articles in folklore and other journals and two albums of songs for Folkways, *Folk Songs of Missouri* (1959) and *Folksongs of the Midwest* (1973), both accompanied by extensive notes on the songs and contributors.

Following his retirement from North Kansas City High School in 1982, Cansler worked in the Missouri Valley Room of the Kansas City Public Library and devoted himself to transcribing and organizing his collection, which with field notes, published and unpublished articles, and other materials, has been deposited in the University of Missouri Western Historical Manuscript Collection in Columbia. His work was profiled in a video, *Down in Missouri with Loman Cansler*, produced in 1982 by the University of Missouri.

Carmer, Carl Lamson (1893–1976)

Author and collector of Southern and New York folklore. A native New Yorker descended from Dutch farmers, Carmer graduated from Hamilton College in Clinton, N.Y., and Harvard University. He wrote poetry about upstate New York, and in 1921 he accepted a position teaching poetry classes at the University of Alabama.

His six years in Alabama were the apex of his career. Interested in folk dancing and singing, he accompanied students and friends, including Ruby Pickens Tartt, who introduced him to Afro-American oral traditions, on treks through Alabama back roads. Visiting both shacks and mansions, Carmer observed a lynching, tasted moonshine, and listened to storytellers. In a journal, he recorded local lore, fiddle songs, and unique characteristics of his adopted state, which he called the “strange country.”

Leaving Tuscaloosa in 1927, Carmer planned to pen a scholarly article on Southern folklore but instead produced a collection of poetry, *Deep South* (1930), and *Stars Fell on Alabama* (1934), a portrait of Alabama cultural history that describes baptizings and foot washings, Ku Klux Klan rallies, and other eccentricities of the Deep South, especially documenting Black Belt plantation life. Although criticized by Northern reviewers for romanticizing antebellum customs, and by Southern readers for reporting about racial violence, Carmer attained national recognition as a folklorist.

A member of the New York State Folklore Society, Carmer focused on Hudson Valley folklore, writing books such as *Listen for a Lonesome Drum* (1936) and editing albums of regional songs. On his radio program, *Your Neck of the Woods*, Carmer discussed national folk heroes and myths.

Carrière, Joseph Médard (1902–1970)

Collector of Midwestern French folklore and comparative scholar of North American French language and customs. A native French speaker born in Curran, Ontario, Carrière studied French literature and romance languages at Laval University; Marquette University; the Sorbonne, Paris; and Harvard University (Ph.D. 1932). He became a naturalized U.S. citizen in 1936 while serving as assistant professor at Northwestern University. In 1942, Carrière moved to the University of Virginia, where he finished his career as a distinguished professor.

In 1934 Carrière began a series of visits to Old Mines, Missouri, where he found six hundred French-speaking families. Using a wax cylinder recorder, he collected a number of folksongs and tales. Of the seventy-three folktales he collected, sixty-five were told by French-speaking barite miner Joseph Ben Coleman. Published in 1937, his collection of folktales, rendered in Creole dialect, and analyzed by tale type and motif, was later republished, along with English translations and comments by Rosemary Hyde Thomas (1981).

Carrière's work among the Midwestern French is embodied in phonological-historical treatises of Missouri French dialect, a published collection of Indiana French folksongs, reports documenting French folk customs, and a range of perspectives he used in comparative analyses of North American French culture.

Carrière's leadership capabilities, especially in cross-cultural and cross-disciplinary situations, were called upon frequently: He served as president of the American Folklore Society (1946–1947); president of the American Association of Teachers of French (1948–1950); trustee of the Institute Français of Washington, DC (1950–1971); Officier d'Académie Française (1938); and corresponding member of many professional organizations. He was awarded a Medal de L'Académie Française in 1948 for activities in French literature and cultural relations, and he received the French title of Chevalier de la Légion d'Honneur in 1950.

Carson, Fiddlin' John (1868–1949)

Highly influential folk musician who made commercial recordings of 200 sides between June 19, 1923, and February 28, 1934. One hundred and sixty-nine performances were issued. His 1923 recording of “The Old Hen Cackled and the Rooster’s Going to Crow” and “The Little Old Log Cabin in the Lane” were the first country recordings directly marketed to a country audience and, therefore, mark the beginning of the commercial country-music industry.

Much of Carson’s early life is shrouded in mystery; not even the date and place of his birth are certain. Dates from 1868 to 1874 are given in various sources, but March 23, 1868, is the birth date most often accepted. He was born either in Cobb or Fannin County, Georgia; records that would definitely prove one or the other no longer exist. Not surprisingly, there is also debate about when he learned to play; some accounts say at age five, others have it at age eleven. According to tradition, he acquired the nickname “Fiddlin’ John” at an early age from Fiddlin’ Bob Taylor, later governor of Tennessee, who met the youth at a political rally. Although the nickname stuck for the rest of his life, his closest associates usually called him “Fiddler” rather than “Fiddlin John.”

As a young man, Carson moved to Atlanta, where he worked at a variety of jobs and became a fixture at fiddle contests. Within a few years, he became the best-known country artist in Atlanta, a fact not lost on Polk Brockman, a local distributor for the Okeh label. Brockman persuaded his company to record Carson, and the success of those records led to numerous other sessions over the next eleven years. His first six sessions consisted mostly of solo performances, but on April 15, 1925, he made his last solo record. Thereafter he recorded with a band, usually consisting of his fiddle, two guitars, and a banjo. His daughter, Rosa Lee, generally billed as “Moonshine Kate,” frequently supplied banjo and guitar work as well as vocals on these recordings.

Carson’s repertoire consisted of pre-20th-century secular folksongs (like “Bachelor’s Hall”), wordless fiddle tunes (like “Billy in the Low Ground”), minstrel show songs (like “Bully of the Town”), 19th-century popular, non-minstrel songs (like “After the Ball”), 20th-century pop songs (like “Darkstown Strutters’ Ball”), religious songs (like “At the Cross”), and 20th-century folk-style songs (like “The Death of Floyd Collins”). Of these categories, the pre-20th-century secular folksongs made up the largest portion of Carson’s repertoire, and religious songs were the smallest portion. By the mid-1930s, Carson’s style was considered *passé* and, as a result, his recording career ended. That he was unwilling to alter his style to suit changing tastes indicates that he was typical of most folksingers, who are conservative in such matters. Indeed, it seems likely that his style of singing and playing changed little since the 1880s; thus, listening to his recordings offers a chance to hear the sort of music many Americans, particularly those in the South, liked in the late 19th century.

After his recording career ended, Carson was awarded political patronage jobs as elevator commissioner (meaning he occasionally ran the elevator in the Georgia State

Capitol) and game warden at large by Gene Talmadge in appreciation for Carson's help in his gubernatorial campaign. Carson died December 11, 1949.

Carter Family

Highly influential pioneer hillbilly singing group who recorded more than 250 songs between 1927 and 1941. From their recording debut and throughout the Depression, their

music continued to sell. A.P., Sara, and Maybelle Carter became a model for country music, singing old ballads, sentimental pieces, humorous songs, Victorian parlor songs, religious songs, and ballads, and a few of their own compositions. In the late 1930s, they went to Del Rio, Texas, broadcasting from 1936 to 1942 over XERA, the most powerful radio station in the world. The trio disbanded in 1943, following their final radio work over WBT in Charlotte, North Carolina.

The group influenced generations of country musicians, who built on both their style and their repertoire. While their music was a simple blend of vocals with guitar and either a second guitar or autoharp accompaniment, their unique harmonies and syncopation set the stage for bluegrass and other styles of country music that adhered most strongly to traditional songs and sounds. Their repertoire and style influenced another generation of musicians during the folksong revival.

The Carter Family was made up of Alvin Pleasant Delaney Carter (A.P.), his wife, Sara, and her first cousin, Maybelle. A.P. Carter was born in Scott County, Virginia, on April 15, 1891, the oldest of eight children. He inherited a rich store of music, including ballads and religious songs. His maternal uncle, a music teacher, taught A.P. a good deal about singing as well as how to read shape notes. Carter also sang bass in a church choir as early as 1913.

Sara was born Sara Elizabeth Dougherty in Wise County, Virginia, on July 21, 1898. After her mother died when she was two, she was raised by her aunt and uncle, Melinda and Milburn Nickles, who lived in Scott County on the other side of Clinch Mountain from the Carters. She grew up with a wealth of traditional music. At an early age, Sara learned to play the autoharp, then banjo, and guitar.

The third member of the trio was Maybelle Addington, born near Nicklesville, Scott County, on May 10, 1909. Maybelle grew up within a quarter of a mile of Sara and early on showed an interest in the music of the community. She soon mastered the autoharp, banjo, and finally the guitar.

In 1914, while selling fruit trees, A.P. Carter visited a distant relative and met Sara, who was singing "Engine 143" and accompanying herself on the autoharp. This meeting was followed by more visits and letters back and forth. They married on June 1, 1915. A.P. brought his new bride back to Maces Spring, Virginia, where his family lived. Sara brought a few pieces of furniture, several quilts, and a dozen pullets and a rooster that her aunt had given her.

A.P. and Sara now began taking their home music throughout the local community. They played with other musicians in the area and occasionally made more formal appearances such as a performance they gave at the Newhope Methodist Church on Christmas in 1915. Despite their musical popularity, A.P. made his living by farming, selling fruit trees, carpentry, and other rural occupations. Over the years, visits to see Sara's relatives were frequent. As Maybelle grew up, she joined in their music making.

The trio crystallized after Maybelle's marriage to Ezra, A.P.'s brother, in 1926. Now, for the first time, they all lived in the same community. They performed throughout the area. From time to time, they played at schoolhouses or other meeting places for money. A.P. did the promotions. The personnel of the group was quite fluid. If one member of the family could not be there, other relatives filled in. A.P. always served as emcee and introduced his wife, then Maybelle, and, finally, any other family members who might be performing that night. He always stressed the family relationships when introducing the members. The musical aggregate was so informal that when Sara and A.P. auditioned for a Brunswick talent scout, Maybelle bore no hard feelings from being left out.

In 1927, Ralph Sylvester Peer set up a temporary recording studio in the state-line city of Bristol, Tennessee/Virginia. A.P. probably learned of the auditions through an article or advertisement in the *Bristol News Bulletin*, and the trio decided to try out. Maybelle was pregnant with her first child, and A.P. and Sara brought along their baby, Joe, as well as eight-year-old Gladys to baby-sit. Sara remembered being embarrassed by her country clothes and entering the makeshift studio by the fire escape to avoid being seen. Maybelle recalled asking A.P. if she should bring along her guitar.

This was homespun music. The Carters sang into a microphone in the same way they had to friends, but the media of recordings and later radio took the Carters' music to far and distant places they had never dreamed of singing. Their first recording, made on August 1, 1927, was a traditional song, "Bury Me under the Weeping Willow." The trio sang with Maybelle's guitar and Sara's autoharp. The first day, they recorded four songs. The next day, they recorded two more selections, including "Single Girl, Married Girl," a traditional lament on which Sara sang solo, accompanied by her autoharp and Maybelle's guitar. Peer recognized her singing talent, commenting: "As soon as I heard her voice...that was it."

After this initial session, the Carters, like most of the others who recorded for Peer during his nine-day recording expedition, returned to their normal lives. But the Carters met with unanticipated success. Over the next fourteen years they were called back into the recording studios eighteen more times. Their recordings were distributed in Australia, Canada, England, India, Ireland, and South Africa as well as the United States.

Despite the sale of their records, the Carter Family continued a simple rural life with occasional appearances in nearby Tennessee, Virginia, Kentucky, and North Carolina. Booking was informal. A fan might write them a personal letter and ask if they could do a performance and work out the details. At these shows, not only did they perform, they also learned and obtained leads on new songs. In order to augment their repertoire, A.P., especially, kept on the lookout for new material. Their original repertoire consisted of songs they knew and a few numbers that A.P. had written. When the supply was exhausted, A.P. became a sort of folksong collector. Stories abound about him searching out obscure material and having a sixth sense about where he might find songs that could be adapted to the Carter style.

By about 1930, personal appearances had come to an end. Regular employment took Maybelle and her husband to Washington, DC; A.P. journeyed to Detroit to work as a carpenter. But the group always came together to rehearse new material for recording sessions. Another deterrent to personal appearances was the tension that was developing between A.P. and Sara, which led to separation in early 1933 and finally divorce.

After the separation, the Carters continued to record. In 1936, Peer, who continued to manage the family as well as publish their songs, arranged for them to broadcast over radio station XERA. The studios, in Del Rio, Texas, transmitted from across the border in Mexico. This work gave the Carter Family an exposure they would otherwise never have enjoyed because the station broadcast their daily shows into all forty-eight states as well as numerous foreign countries. By 1938 their radio work took a new twist as they stopped making live broadcasts and moved to San Antonio, where they made transcription disks of their shows, broadcasting the transcriptions from several border stations.

In 1939 Sara married A.P.'s cousin, Coy Bayes. Sara and Coy moved to California, but she returned for recordings and other work until the group finally disbanded in 1943. After that time, Sara lived in the Sierra foothills of California until her death in 1979. A.P. returned to Maces Spring and lived with his daughters until his death in 1960.

Maybelle, now bitten by the show business bug, moved to Richmond, Virginia, where she and her daughters worked on the WRVA Old Dominion Barn Dance before moving on to the Grand Ole Opry in Nashville, where Mother Maybelle and the Carter Sisters enjoyed a successful career for many years. She died in 1978.

The Carter Family music expressed their collective musical taste, but the imagination to record clearly belonged to A.P. Even after the breakup of the original group, he always hoped he would find a way back into the music business. Although A.P. had helped build the foundation of modern country music, he simply could not alter his offerings in the way the commercial music world demanded. Maybelle, on the other hand, made the transition into commercial Nashville music. She sensed the required changes and accommodated. Sara loved the music but did not care one way or the other about the music business. The Carter Family was elected to the Country Music Hall of Fame in 1970.

Although the Carter Family recorded a number of traditional pieces, they are nevertheless the name associated with many of the songs they recorded. Among their best-known pieces are their theme song, “Keep on the Sunny Side,” as well as “Worried Man Blues,” “Wildwood Flower,” and “Wabash Cannonball.”

The original Carter Family has been silent since 1943, but descendants into the third generation are still actively performing on stage and recordings.

Cassidy, Butch (Robert LeRoy Parker) (1866–ca. 1908?)

Western outlaw and subject of legends. Cassidy (an alias) was born to Mormon pioneer stock in southern Utah and became the leader of the Wild Bunch, a group of rustlers who graduated to robbery of banks, mines, and trains in the 1890s, frequently hiding out in remote parts of Wyoming and Utah. Their migratory ways, the obsessive pursuit of them by the Pinkertons, and their specialization in attacking the most feared and hated institutions in the West led to a wide range of Robin Hood-like legends. After fleeing in 1902 with Harry Longabaugh (“The Sundance Kid”) and Etta Place to South America, where they began a series of bank and gold-shipment robberies, Cassidy and Longabaugh were reported killed in a battle with Bolivian troops about 1908, but persistent stories of sightings—one dated 1958, when Cassidy would have been ninety-two—suggest that they somehow escaped to the United States.

In keeping with the Robin Hood motifs, most legends turn on Cassidy’s defiance of the power of government and industry, on his trickster-like wit and intelligence, on his ability to escape death and frequently reappear, and on his compassion for the weak, the poor, and the downtrodden. Supposedly, Cassidy never killed anyone, spared the lives of bank and railroad-express clerks, rode through a snowstorm with medicine for a sick child, and gave away large sums of plunder. In one frequently repeated tale, Cassidy heard that a poor widow was about to lose her ranch to foreclosure. The Wild Bunch rode into town, held up the bank, delivered the full amount of the mortgage to the widow, waited until the banker had collected from her, then held him up again. Similar tales have been told of Robin Hood, Jesse James, and Sam Bass.

Other legends concern buried treasure throughout his range, secretive visits to his aged mother, and sightings of him with Pancho Villa, Wyatt Earp, and scores of old friends. Many of these recent legends have gained material from a dozen books published since 1938 and from popular television shows and films beginning with George Roy Hill’s *Butch Cassidy and the Sundance Kid* (1969). The entire corpus suggests the increasing influence of modern media on oral narrative and their growing interdependence.

Catfish

In America, eight edible species of the family *Ictaluridae*. Three species (*Ictalurus melas*, *natalis*, and *nebulosis*) are called “bullheads.” They are the most common and prevalent catfish on the North American continent. Bullhead fishing with improvised gear and bait is a childhood tradition over much of North America.

More important in traditional culture are four species called simply “catfish,” or “cats.” They are the channel cat (*I. punctatus*), the blue cat (*I. furcatus*), the white cat (*I. catus*), and the flathead, yellow, or mudcat (*Pylodictis olivaris*). All are common in the South and (excepting the white cat) the Midwest. Local taxonomies include additional “folk” species, such as the “coalbolter” and the “boneless cat.”

Catfish never achieved the importance to Native Americans that they later reached among some Whites and African Americans. Only the Arikara of the northern Plains and the Cherokee of the Southeast made them an important part of their diet. A’yuⁿini, or Swimmer’s, mid-19th-century North Carolina Cherokee manuscript includes a prayer to induce large blue cats to the hook.

Catfish are associated with popular stereotypes of lazy or relaxing rural Southerners or Midwesterners sitting by a riverbank or pond with a pole. Cats are popularly believed to be scavengers and are, therefore, not considered fit food by many people, especially farm families. However, the barefoot kid fishing for catfish or bullhead in the old swimming hole is also part of rural Southern and Midwestern nostalgia. Another sentimental image is the poor man catching catfish on his trotline. Riverbank tramp characters in literature and popular culture, such as Cormac McCarthy’s Suttree and “Catfish John” in the bluegrass song by Bob McDill and Allen Reynolds, are closely associated with catfish.

Catfish’s reputation as a bottom feeder has made it a despised food fish for some, especially those who revere clear-coldwater game fish. Captain Frederick Marryat’s 19th-century description of the Mississippi River declared that “it con-tains the coarsest and most uneatable of fish, such as the catfish,” to which Mark Twain replied, “the catfish is a plenty good enough fish for anybody.”

The paramount commercial fish in Southern and Mid-western rivers are young channel cats, known as “fiddlers,” when under about fifteen inches. Fully grown, they can reach over sixty pounds and four feet, but such large ones are extremely rare today. Fiddlers are easy to distinguish from other young catfish because of their spotted skin. At the eight- to ten-inch range, they have the best flavor and texture. Fiddlers are reputed to be the most delicious fish in the rivers.

Fiddlers are also the chief crop of both the commercial catfish farms and the “pay-and-fish” ponds that have proliferated in the American South. Mississippi is the leading catfish-farming state. Most commercially sold catfish, retailed in supermarkets and eaten in restaurants, are fiddlers, but connoisseurs consider farm- and pond-raised fiddlers inferior. They claim that commercial feed “makes them taste like alfalfa” and that they are soft and mushy due to lack of the muscle tone that they would have, were they fighting current in a river.

Flatheads (yellow cats, mudcats) are called *goujon* by Cajuns and “cushawn” by Lower Mississippi Anglos. They grow large, up to six feet and more than 120 pounds. Three- and four-footers are still caught. Combined with its habit of hiding in hollow logs and old tiles and culverts, the flathead’s unsavory looks have caused it to be maligned. Thus the use of the term “flatheads” to describe bottomland bandits and riverbank squatters, and Huckleberry Finn’s description of his father as of “no more breeding than a mudcat.”

Channels, flatheads, and especially blues can achieve enormous size, and this quality has helped make catfish an important part of local folklore in many areas where the fish are native. Monster and horror legends about extremely large catfish abound, usually concerning flatheads or blue cats. Monstrous flatheads are reputed to inhabit oxbows, cutoffs, or backwaters, tempting anglers for years. A number of cut-offs and oxbows in river country have their legendary monster cats, often bearing a name. One is “Cut-Off John,” who has defied anglers for generations, hiding in the Ribeyre Island Cutoff, an oxbow lake across the Wabash River from New Harmony, Indiana. The flathead’s large mouth and its habit of hiding, with its mouth open, ready to swallow anything swimming past, has made it the typical “monster catfish” of legend, despite the fact that blue cats run larger.

Big flatheads have reputedly been caught with various contents in their stomachs, including outboard motors, cats, dogs, and piglets. There are a number of legends of them swallowing humans, or at least pulling unsuspecting humans into the river where they then drown. A Moravian missionary reported such an incident on the Ohio River in 1780. Others are quite current, including the persistent rumor of a large flathead caught at the mouth of the Tradewater River on the Ohio, by Caseyville, Kentucky, which contained a human baby. This supposedly occurred during the 1970s. In Troy, Indiana, local fishermen tell of a ten-year-old boy who was pulled under and eaten by a giant catfish while wading for mussels. A fisherman near Metropolis, Illinois, reportedly drowned after being dragged underwater by the hooks of his own trotline, trying to unhook a giant catfish. Many river folk believe that very large catfish, hardly ever encountered by fishermen, live in deep holes in the river for decades. There are also legends of huge catfish living at the bases of dams, who prey on divers inspecting or performing maintenance.

By way of comparison, it is worth noting that the giant catfish of legend is not only a creature of North America. The Eurasian catfish, or wels (*Siluris glanis*), which has reached fifteen feet and over 600 pounds, has been documented to swallow humans, livestock, and small watercraft.

Part of the lore of the giant flathead includes the practice of catching them by “tickling,” “noodling,” or “hogging.” This practice, which is a traditional display of machismo among young men who live near the river, consists of reaching into hollow logs or under floating debris or overhanging banks to locate a hiding catfish. In some accounts, the tickler strokes the fish, causing it to relax, before grabbing it. Often it is immediately seized, by the lip or gill cover, and hauled ashore. Some ticklers will even thrust a hand down the fish’s throat and grab the gill cover from inside. Flatheads have no teeth, but they do have an abrasive surface on the inside of their lips. A Tolu, Kentucky, man proudly displayed a bracelet-like callus on his wrist from his many tickling adventures. Needless to say, tickling is a risky sport in waters where snapping turdes live.

The flathead's hiding habits help some fishermen trap it by setting out culvert pipes with one end beaten shut. A line with a float is attached to the open end and the fisherman need only pull up the rope every few days to discover and remove what may be hiding inside. Big cats are also caught on largehooked lines baited with everything from bologna to liver to squirrel guts. The most common techniques for catching all species of catfish commercially are the trotline, the hoop net, and the box trap, baited with a strong-smelling bait, such as waste cheese. Fish poachers have used dynamite, fireworks (such as "cherry bombs" and M80s), and telephone magnetos to catch large quantities of catfish illegally.

Despite its negative image, the flathead is a high-quality table fish. Many consider it superior to the more popular channel cat. Its better quality is ascribed to its purely carnivorous diet, which presumably makes it less subject to off-flavors found in more omnivorous species. A minstrel song once popular in Illinois, "The Darkey and the Catfish," sings its praises:

Don't talk to me o' bacon fat
Or taters, coon, or possum,
For when I'se hooked a yaller cat,
I'se got a meal to boss 'em.

The blue cat is the largest species in the river. During aboriginal times, blue cats ran to six feet in length and probably more than 200 pounds. Native Americans told Fathers Joliet and Marquette stories of man- and canoe-eating monsters that lived in the Midwestern rivers. Marquette's own canoe encountered a fish that struck it with such force that he first thought the fish was a tree trunk. Huck and Jim caught one over 200 pounds. One of the largest ever recorded was a 150-pound behemoth shipped to the Smithsonian Institution in Washington, DC, from the Missouri River in 1879, and there were claims that river had produced a 315-pounder earlier in that century.

Legends and tall tales about blues sometimes describe them weighed down with tackle from previous encounters. A Wabash River fisherman claims to have landed on a trotline a big blue cat with so many hooks and sinkers stuck in it that it was sold to a scrap-metal dealer. A look through family photo albums of river folk often reveals many photos of people, frequently fishermen's children, standing beside a large blue cat hanging on an overhead hook.

A somewhat confusing catfish is the "coalbolter" or "niggerlipper." Midwestern fishermen consider it a separate species, as did biologists until the 1940s. (They called it *I. anguilla*, the "eel or willow cat.") Now it is considered a variant of the channel cat. "Niggerlipppers," as they are commonly called, at least by Whites, are a late spawn run of channel cat, with distinctive genetic characteristics. They have no spots, and a more massive head than ordinary channel cats.

People with little experience with catfish often erroneously believe that the barbels, the whisker-like feelers around the fish's snout, are venomous. The three spines that extend from a catfish's dorsal fin and gill covers can injure, and they do contain a slightly venomous, or at least irritating, substance to which some people react very painfully. The folk cure is to rub the wound with slime from elsewhere on the fish's body. The Arikara

used a local sagebrush species as an antidote for catfish venom. Fishermen sometimes encounter the tiny catfish called the tadpole madtom or “polliwog” (*Noturus gyrinus*) whose dorsal spine contains a painful venom.

The importance of catfish in the Kentuckian pioneer diet is noted in the writings of Harriet Simpson Arnow. Catfish are usually breaded with a spiced cornmeal-and-flour mixture and deep-fat fried, the smaller ones whole, the larger ones as steaks. Some individuals living near the rivers are reputed to be especially fond of eating big catfish. Sometimes large cats are barbecued in the fashion typical of the Upper South and Lower Midwest, which consists of slow roasting over a charcoal fire to which green hickory blocks have been added.

The spoonbill, paddlefish, or spooney (*Polyodon spathula*) are no relation to the catfish family, but they count as a catfish in the markets of the lower Midwest and Upper South. They have catfish-like flesh and no bones and are sold as “boneless cat.” They are a very unusual looking fish, with a shark-like body and an oar-like snout one-third the length of the entire fish.

Rare enough to be endangered in most localities, spoonbill are still commercially fished in a few areas. They also have their place in local legend. Called a “living fossil,” they have teeth only when very young. The toothless adults are plankton feeders and are almost never caught by anglers, except when accidentally snagged. They can grow to six feet and 200 pounds, but even eighty-pounders are rare today. Commercial fishermen regularly catch four-footers in the fifty-pound range. Their large size, shark-like shape, and bizarrely formed head have also been a source of monster-fish legends.

Perhaps because of their odd appearance and unfamiliarity to the casual angler, spoonbill are thought by many to be inedible. A Cave-in-Rock, Illinois, fish, market customer expressed loud revulsion as a fisherman hauled in a tub of freshly caught spoonbill. “You’ll never catch me eating one of those!” he exclaimed with disgust, and promptly purchased thirty pounds of frozen, dressed, packaged boneless cat for a family reunion. The spoonbill fishery industry in the 1940s wasted many fish in the quest for spoonbill caviar. Caspian caviar was then unavailable due to World War II, and New York restaurants bought caviar from Midwestern and Southern rivers. Boneless cat are filleted and deep-fried and served as fish sandwiches.

Catfish are also the focus of local boosterism in a number of Southern and Midwestern communities. “Catfish Capitals of the World,” complete with annual catfish festivals, include Belzoni, Mississippi; Paris, Tennessee; Petersburg, Indiana; and Toad Suck, Arkansas.

Cemeteries

Sites of interment, concentrated repositories of unique material artifacts (gravemarkers), and focal points for a wide variety of traditional practices. The concept and physical siting of cemeteries in America follows a distinctive evolutionary pattern closely linked to changing standards in taste and cultural values. Unlike their European (primarily British) counterparts, the earliest organized burial sites in the colonies did not, as a general rule, surround church structures and thus were not commonly known as “churchyards.” Instead they were called, in the more generically descriptive terms, “burying ground,” “burial ground,” or “graveyard.” The term “cemetery” itself, deriving from the Greek word for sleeping chamber, would not gain general currency until the early 19th century, eventually

Carolina. Library of Congress.*

to be challenged in the 20th century by the even more euphemistic “memorial park.”

Community burial grounds in New England and other areas of early American settlement, though they often had recognizable perimeters, generally lacked formal

patterns of internal organization and—other than the gravemarkers themselves—overtly decorative qualities. Markers were arranged rather haphazardly, with scant attention to precise alignment, and their placement within the yard was more often a reflection of death date than familial or social status. Formal pathways, secondary plantings, and other decorative alterations to the landscape were infrequently employed, all of this symbolically in keeping with prevailing attitudes toward death, which viewed it as a grim necessity untempered by elements of sentimentality or, for that matter, undue hopes for a blissful afterlife.

By the early years of the 19th century, burial grounds situated within burgeoning urban areas were becoming filled to capacity and were viewed as both eyesores and health hazards. These factors, combined with, on the one hand, a practical desire to utilize valuable urban real estate in a more profitable manner, and, on the other, aesthetic and philosophical considerations deriving from European Romanticism, helped create a radically new concept in cemetery design and function. Located outside existing urban boundaries, on sites specifically chosen for their topographical and horticultural qualities, these new “rural” cemeteries, characterized by their tasteful blending of splendid monuments with other natural and ornamental features, became sentimentalized landscapes of memory, often functioning as the forerunners of urban parks, and would set the tone for cemetery design into the next century.

The last phase of this evolutionary process—and that which has come to dominate 20th-century cemetery design—is the “memorial park,” a generally nondescript landscape featuring markers set flush to the ground surface and a minimum of plantings or other decorative features. Along with these developments has come the trend of memorial parks serving as “one-stop shopping” centers for funerary purposes, one convenient location where all necessary services—mortuary, burial (or crematory), floral, monumental, even nonsectarian religious—can be arranged in a single transaction. To many, such places would seem to epitomize not only late-20th-century Americans’ obsession with convenience, but also the enormous distance they have contrived to place between themselves and the fact of death itself.

While the majority of cemeteries in America have always been municipally or privately controlled operations, a sizable proportion of them were initially created, and in many instances are still maintained, by various fraternal, religious, and ethnic groups. Though they share many of the features of the “mainstream” cemeteries, these sites, owing to the specialized nature of their clientele, frequently exhibit a number of highly unusual and meaningful qualities, particularly with regard to gravemarker iconography and ritual funerary and remembrance patterns. Nowhere is this more evident than in the large number and wide variety of ethnic cemeteries found in America, wherein it is possible, among other things, to chart the shifting balance over time between patterns of cultural retention and assimilation.

Traditional practices associated with cemeteries, one of their least-studied features, are widespread and vary considerably along historical, regional, and ethnic lines. The evolution of the typical American funeral—particularly its gravesite elements—from the elaborate processions of the Puritans and highly codified mourning behaviors of the Victorians to the essentially sanitized ceremonies of the late 20th century serves as one telling indication of historic changes in the manner in which Americans have chosen to ritualize this significant rite of passage. Among the more interesting of regional patterns

in cemetery-related ritual is the practice, widespread throughout much of America's Upland South areas, of Decoration Day, an annual time of cleaning, repair, and decoration closely allied to concepts of familial and community solidarity. Ethnic groups provide some of the most interesting and colorful of all such traditions. Frequently annual in occurrence and centered around familial customs of ancestor worship, these ethnic traditions include practices ranging from Louisiana Cajun grave painting to the cemetery-specific elements of such festivals as *Ching Ming* (Chinese), *O Bon* (Japanese), and *La Dia de los Muertos* (Mexican).

Finally, cemeteries provide the stimulus and focal point for an astounding variety of traditional practices, beliefs, and even narrative forms prominent in American folklore. From proverbial utterances such as "whistling past the graveyard" to superstitions and popular beliefs (such as "When a grave sinks early, another will follow soon") to blues and other musical forms (like John Lee Hooker's "Graveyard Blues"), cemeteries function as a metaphorical context for a number of elements of folk wisdom and sentiment. Legends of all sorts, ranging from traditional ghostlore to accounts of weeping sculpted angels and telephones in mausoleums, feature cemeteries as their primary setting. Sad to say, even destructive forms of behavior such as cemetery vandalism may be viewed as essentially folkloric activities, especially when practiced—as is most frequently the case—by age- and gender-specific groups as rituals of initiation, bonding, and status enhancement.

In America, as elsewhere, cemeteries are outdoor museums—of history certainly, but also of art, architecture, ethnicity, regionalism, and a host of other elements of cultural evolution. For the folklorist, they represent a substantial body of readily available resources whose full potential has been barely explored.

Center for the Study of Southern Culture

First institution established for the interdisciplinary study of the American South. Founded in 1977 at the University of Mississippi, the center has had only one permanent director so far (1995), folklore scholar William R. Ferris. In 1995 the associate director was Ann J. Abadie, and faculty included Charles R. Wilson and Ted Ownby (history), Robert Brinkmeyer (English), and Lisa N. Howorth and Thomas Rankin (art). The curriculum offers core courses in Southern studies and cross-listed courses in history, English, anthropology, sociology, music, art, political science, Afro-American studies, and women's studies, culminating in B.A. and M.A. degrees in Southern studies.

The center publishes a quarterly newsletter, the *Southern Register*, and several magazines, including *Old Time Country*, *Rejoice!*, and *Living Blues*, the major American blues serial. It sponsors an interdisciplinary journal, *Crossroads*; has underwritten several reference books, including the *Encyclopedia of Southern Culture* (1989), edited by Wilson and Ferris; and has published several other books.

The center cosponsors annual conferences, including the Faulkner and Yoknapatawpha Conference, the Chancellor's Symposium in Southern History, and the Oxford Conference for the Book, as well as individual symposiums and weekly presentations that are open to the public. Graduate students in Southern studies have conducted folklore fieldwork for the National Park Service and the Woodruff Foundation.

The Center for the Study of Southern Culture is housed in the restored Barnard Observatory, one of three antebellum buildings on the University of Mississippi campus in Oxford.

Chanteys

Songs sung to accompany work in maritime settings. The practice of singing while at work was historically a widespread phenomenon crossing cultural boundaries from Greece to the Hebrides and extending to virtually every corner of the earth. In all of sub-Saharan Africa, including the area from Senegal to Angola, from which most of the American slaves were taken, songs were sung by individuals to accompany a variety of tasks, including ironwork and weaving. More typically, group tasks, such as agricultural work and the rowing of boats, utilized the overlapping call-and-response singing style, the leader calling or singing a phrase and then joining the other workers in a completing chorus. The Limba of Sierra Leone sang while hoeing in their rice seed. In work collectives in Dahomey (modern Benin), known as *dokpwe*, workers used such a style while kneading earth for walls, laying thatch, and hoeing, and there were other cooperative labor systems—such as the *kurum* of Cameroon, the *ku* of Liberia, and, in the New World, the *coumbite* and *societe* of Haiti and the fishing people of Nevis

and Tobago—in which the people utilized singing to accomplish their work, be it catching fish or moving houses.

Many of these tasks, in fact, both in Africa and the Caribbean, were water-related, from the growing of rice, to fishing, to transportation. West African dugout canoes, or pirogues, have been shown to have contributed to the evolution of the Native American canoe, and West African men, such as the Kru of Liberia, were acknowledged masters of both boat construction and boat handling. The early presence of the Wolof of Senegal aboard European ships may have contributed to the high instance of Wolof-derived words that have survived in New World English, and men of African descent were to be quite prevalent aboard sailing ships and those that came after.

The use of chanteys (or shantys) aboard European and New World ships seems to draw heavily on West African influence as well. While there was at least a Celtic precedent for maritime worksongs, the African call-and-response pattern, such as that still used by the boatmen of the Zaire (Congo) River, seems to have had a strong effect on the evolution of the New World chantey. The word itself, depending on the choice of spelling, may derive either from the imperative form of the French verb *chanter* (to sing) or from the singing heard from or during the moving of the waterside huts, or “shantys,” another French-derived word from *chantier* (a timberyard or shipyard). Neither spelling occurs until the middle of the 19th century, and chanting as we know it may date from as little as a generation before that.

The first mentions of songs we can identify with this classic chanting tradition are drawn from shore-based occupations of New World Blacks, including the songs of the boatmen who worked the waters of the Caribbean and the Southeastern United States. Like their African forebears—or, indeed, as they themselves may have done before being transported—the New World boatmen sang as they rowed, utilizing the call-and-response pattern and, occasionally, the beat of a drum. Much remarked upon in the coastal waters of South Carolina, the sound and style of these workers were very similar to those heard on the coast of Ghana in the 1790s.

The songs of the boatmen on the South Carolina coast also seem to have added to this a high proportion of Christian spiritual songs, including “On Canaan’s Happy Shore,” “Roll, Jordan, Roll,” “Run, Mary, Run,” and “Drinking Wine, Drinking Wine.”

The African worksong tradition also adhered to other mainland and coastal occupations. The Black firemen aboard steamboats sang at their work as did the stevedores and roustabouts of the Southern ports. Near the shore, agricultural workers sang at their labors, and so did the mule skinnners and those who worked constructing and maintaining the railroad tracks. Workers in tobacco warehouses, oyster-shucking and crab-picking houses, and those under confinement—whether slaves marching in shackles or prisoners behind bars—all frequently used singing to make their work go better. All of these precedents combined to create the chanteys used by the menhaden fishermen who worked the waters from New Jersey to Texas. Catching the oily menhaden for industrial applications, these fishermen were the last actively to use chanteys. The invention of the power block, a mechanical net-puller, in the mid-1950s all but eliminated the old songs, but older fishermen continued to sing them for pleasure into the 1990s.

Chase, Richard (1904–1988)

Collector and performer of Jack tales, folksongs, and dances. Chase's family was from New England, but his father established a nursery near Huntsville, Alabama, and Richard grew up there. He went to local schools and, as he put it, a school in Tennessee "for problem boys." At age twenty, Chase was in Boston, where he learned about the Pine Mountain Settlement School in Kentucky. There he discovered ballads and the work of folksong collector Cecil Sharp. He had found his calling. For the rest of his life, he collected, performed, and taught various forms of folklore to audiences around the country.

In the mid-1920s, Chase attended Harvard University for two years and also took courses in progressive education with Marietta Johnson in Greenwich, Connecticut, and Fair Hope, Alabama. During this period, he worked off and on as a performer-teacher of folksongs and dances. In 1929 he graduated from Antioch College in Ohio with a B.S. in botany. He married in 1930 and then spent two or three years in Europe, where he developed contacts with the English Folk Dance and Song Society.

In 1935 Chase was hired to teach folksongs at a teachers' conference in Raleigh, North Carolina, and, from a student there, he learned for the first time about Jack tales (essentially, European-derived Märchen [fairy tales] that feature a young man, Jack, as the main protagonist). Chase began collecting, performing, and publishing Jack tales, collected primarily from members of the Ward family of Beech Mountain, North Carolina. Six tales were published in *Southern Folklore Quarterly* beginning with Volume I, Number 1 in 1937 and continuing into 1941.

In late 1940, Chase learned through the Ward family that there were Jack tales to be found in Wise County, Virginia. About a year later, he was employed by the Works Progress Administration (WPA) Virginia Writers' Project to put together a book on Wise County folklore, but the goal was shortly changed to emphasize folktales. For various reasons—in part because the Writers' Project ended—the Wise County book was never published, but thirty-four Wise County tales, fifteen of which were Jack tales, were included (in whole or part) in Chase's three books: *The Jack Tales* (1943), *Grandfather Tales* (1948), and *American Folk Tales and Songs* (1956).

Chase also began working with the White Top Mountain folk festival in North Carolina in 1934 and remained with it until its demise in 1941. The next year he moved to a small farm in Albemarle County, Virginia. His life and travels between 1942 and his death in 1988 are too complex to delineate here. Suffice it to say that, in that period, he lived, traveled, and performed in various places in Virginia, North Carolina, and California, moving back to his original hometown of Huntsville, Alabama, about 1983.

Richard Chase is best seen as an editor of folklore, using his creativity to put together several versions of each Jack tale when he told it or when he published it. His collated versions were widely popular and are frequently told by professional storytellers; and a few appear to have been picked up by traditional tale-tellers.

Child, Francis James (1825–1896)

Ballad editor, literary scholar, and a founder of the American Folklore Society. One of eight children in the family of a sailmaker in Boston, Child graduated from Boston Latin School and Harvard College, where he subsequently became a tutor, first in mathematics, then in history and political economics. After study at the Universities of Berlin and Göttingen, he was appointed Boylston Professor of Rhetoric and Oratory and, finally in 1876, Harvard's first professor of English.

Renowned as a scholar, revered as a teacher, and admired as an administrator, when he was in Germany Child became a great admirer of the brothers Grimm and was thoroughly imbued with the scholarly techniques of the German philologists, whose methods, relatively new to the United States, he adhered to for the rest of his life. These methods allowed him to edit *The Poetical Works of Edmund Spenser* and to publish a volume modestly entitled *Observations on the Language of Chaucer's Canterbury Tales*, perhaps the first truly scientific analysis of the Middle English language. In addition, he lectured and wrote extensively on the works of Shakespeare, taught courses on the full range of English literature, and was constantly involved in the teaching of what today would be called composition. Among his students and colleagues were such influential scholars as George Lyman Kittredge, Francis Barton Gummere, and Phillips Barry.

Despite the excellence of his literary work, Child is known primarily for his edition of the five-volume work titled *The English and Scottish Popular Ballads* ([1882–1898] 1965). Child's approach to ballads was governed by his training in the methods of German philologists. Unlike such predecessors as Percy, Scott, and Jamieson, who also looked upon ballads as a part of the English literary heritage, Child subjected ballad texts to the same rigorous scrutiny he had applied to the poetry of Spenser and the language of Chaucer. In addition to reproducing every text exactly as he found it, Child attempted in his notes to set each text in its own narrative tradition and sought narrative parallels internationally, a practice followed in Scandinavia by such editors as Svend Grundtvig. Indeed, so close are the editorial techniques employed by Child in *The English and Scottish Popular Ballads* and Svend Grundtvig in *Danmarks gamle Folkeviser* (1853) that one must see Child and Grundtvig as intellectual collaborators, a fact borne out by their correspondence (Hustvedt 1930). Moreover, neither Child nor Grundtvig was a field collector, and Child's edition of 305 ballad types, which he saw as definitive, derived with very few exceptions from manuscripts or books, as do most of Grundtvig's 539 Danish types.

The English and Scottish Popular Ballads has served in the English-speaking world as the definer of the ballad genre: Ballads are what appear in Child! Though folklorists often decry Child's dependence upon manuscripts and printed materials, though ethnomusicologists lament his lack of attention to music, and though popularists question his apparent notion that ballad singing was dead when he began his editorial work, there is absolutely no doubt that Francis James Child laid the groundwork for ballad study in the 20th century.

Children

A folk group defined, primarily, by age. From the first encounters with their peers until the time they begin to experience puberty, children create and pass on traditional lore—oral, customary or social, and material. While they are aware of sexual and racial differences and, to an extent, ethnic and national differences (all of which show up in their lore), children transmit their folklore quite freely within their group. Children’s folklore is the traditional material created and transmitted by children up to about age twelve; after that, they are adolescents, and their lore changes as they attempt to put childhood behind them.

The family is the first folk group within which children learn traditional materials. The various rituals practiced at mealtime, bathtime, and/or bedtime, on holidays, for birthdays and other anniversaries, during the different seasons, and at any other times when the family regularly gathers form some of the initial ways in which a child’s world is structured. A child soon learns that different families have different traditional practices, and children discuss these differences with their parents and peers.

Once children begin to associate with their peers without direct adult supervision, they begin to learn their own group’s folklore, which often has been passed down to the present through centuries of generations. That folklore comprises three broad categories: (1) *oral*, those items from individual words to complete stories that make up children’s discourse; (2) *customary*, those traditionally established practices, whether simple superstitions or complex games, by which two or more children interact; and (3) *material*, all of those concrete items, like paper airplanes and snow forts, that children learn to build during their preteen years.

As children interact in the sandbox or the backyard, at day care or kindergarten, they use words that have specific meaning within their age group. Some of their earliest oral folklore consists of words like “doo doo,” to refer to feces, or “doo doo head,” an insult, which they have made up themselves. At one time, it was common for children to use the word “fish” as a derogatory adjective, as in “Those are really fish sneakers!” to indicate an unacceptable pair of sneakers (a discount-store brand rather than a fashionable name brand, for example). Certain pranks may have their own names; a “wedgie” or “melvin” describes the act of pulling someone else’s (usually a male’s) underpants up sharply by the rear waistband. As children become aware of conformity, they have special epithets and insults for the nonconformers who tatle (“Tattle tale, tattle tale...”), lie (“Liar, liar, pants on fire...”), cry (“Cry baby, cry...”), allow their underwear to show (“I see London, I see France...”), leave a zipper down (“XYZ,” that is, “Examine your zipper”), or engage in other behavior disapproved of by the group.

With increasing age comes a concomitant development in language skills and oral folklore. Children ask traditional riddles (“What’s black and white and red/read all over?”) and tell jokes (“There was this kid, Johnny...”) that have been around for generations. The category of riddle joke combines the two. The riddle joke—whether about polacks, dead babies, morons, teachers, parents, elephants, famous people, or a host

of other topics—indicates not only the child's increasing capacity for humor, but also his or her participation in a tradition (continuing the moron or Helen Keller jokes) and additions to that tradition (space shuttle disaster or Dolly Parton jokes). These forms of humor, along with parodies of everything from "The Star-Spangled Banner" to "Joy to the Wodd" and a good deal of gross or obscene humor, show both an increasing sophistication of wit as well as a willingness to either mock adult society or violate its rules—perhaps in preparation for the greater independence of puberty.

Children also tell folktales that are often transmitted in situations in which there is little or no adult supervision, but they are about the dangers of such situations. Children at a slumber party or sleepover will, generally after the supervising adults have gone to bed, tell ghost stories and participate in various rituals with ouija boards, mirrors, and other mediums through which they attempt to contact the supernatural. Older (but still preteen) girls who are baby-sitting or are baby-sitters may relate stories such as the one about the threatening telephone call discovered to be coming from an upstairs phone. Boys or girls in summer camps tell, or are told by counselors and then pass on, ghost stories—usually set in the same locale as the camp. The absence of protecting adults (in the usual family ratio) makes the stories scarier.

Customary folklore helps children structure their own activities without adult intervention. Counting-out rhymes ("One potato, two potato..." or "Eeny, meeny, miney, mo...") allow children to pick the first "It" person for the game, the one who must suffer the punishment of being "It" without having been caught. The various tagging, hiding, cliasing, and capturing games all have rules established by tradition that can vary from neighborhood to neighborhood. Whether "It" counts by fives to fifty or tens to one hundred, whether the hiders must hide more than five feet or more than ten feet from the seeker's goal ("Anybody around my goal is it!"), and whether or not the house counts in wood tag are matters for which group tradition provides a rule or an answer. Hundreds of jump-rope rhymes, ball-bouncing rhymes, handclapping rhymes, and other game rhymes (for example, "The farmer in the dell...") provide the structures for games dating back many generations.

Customary behavior also guides children through the wodd in other ways. Some items are learned from both the family and the peer folk group. A child might learn the traditional birthday song from parents, but only his or her peers will teach the equally traditional parody ("Happy Birthday to you, you live in the zoo..."). Other holiday customs may be a similar combination of family and peer traditions. Children also have a variety of folk beliefs or superstitions, from the popular "Step on a crack, break your mother's back" to various omens of, or practices for, luck before the baseball or soccer game or before a test at school, as well as beliefs (many of which they share with adults) having to do with good and bad luck. Girls, mostly, have a variety of ways (twisting apple stems or peeling apples while reciting the alphabet) to discover the initials or name of the boy they will marry or to discover the number of children they will have. There are also clubs, some secret, with their requisite initiation ceremonies, wherein children gadier in groups, united against whatever may come their way.

The category of material culture encompasses the least-studied aspect of children's folklore. Perhaps this is because some of the most obvious items in that group are made of the least-durable substance—paper. The most ubiquitous of these is the paper airplane, constructed in a variety of sizes and shapes from clean notebook paper as well as returned

test papers or homework. Paper is also used for boats, fortune-telling devices, bracelets and chains, drinking cups, “poppers” (which make a loud noise when the teacher is not looking), various animals (some derived from origami patterns), footballs (to play with in study hall), game boards (for “hangman” or “battleships”), puppets and “cootie” catchers, cone-shaped missiles (launched in the updraft from the hot-air heaters), and rubberband-fired spitwads—to name a few. Most of these constructions, along with snappers made from hairpins and various other devices, are found more often in schoolrooms than anywhere else.

Outside of the school, children are equally creative, and they have more materials with which to work. Some of their creations may come from seasonally available materials: sand castles, hideouts, and tree houses in the summer; snow forts, snow angels, sled runs, and snowballs in the winter. Boys, mostly, make guns, knives, slingshots, bows and arrows, spears, lances, and quarterstaves out of available pieces of wood. Boys and girls alike make “motors” for their tricycles and bicycles out of old playing cards or other pieces of cardboard. Girls, mostly, make friendship bracelets out of thread with bits of metal or beads woven in. In our modern, hightech society, some children still make traditional string figures and “conkers” (a British term for horse chestnuts with string through them), a testament to the endurance of some folklore.

A century of scholarship, during which a number of folklorists have found children’s folklore a rewarding field of study, has shaped the current awareness and study of the subject. One of the first to study children’s lore, and also the first editor of the *Journal of American Folklore*, was William Wells Newell, whose *Games and songs of American Children* (1883) was the first major study of American children’s folklore. In some ways, especially in his focus on games and songs, Newell set the tone for much subsequent study of children’s folklore. Shortly after Newell’s book, Henry C. Bolton published *The Counting-out Rhymes of Children: Their Antiquity, Origin, and Wide Distribution: A Study in Folk-Lore* (1888). Newell and Bolton started a trend in children’s folklore that, in many ways, culminated in such encyclopedic studies as Roger Abrahams’ *Jump-Rope Rhymes: A Dictionary* (1969), his *Countingout Rhymes: A Dictionary* (1980), Iona and Peter Opie’s *Children’s Games in Street and Playground* (1969), and their *The Singing Game* (1985). Between Newell’s and the Opies’ books, there were several variations on the main theme. Stewart Culin’s “Street Games of Boys in Brooklyn, N.Y.” (1891) was a study of a specific region and a specific kind of *Street Games* (1976). Other variations included articles and game, and it certainly pointed toward Alan Milberg’s book books that were not exercises in scholarship but collections of games and songs for children, such as Charles Weir’s *Songs the Children Love to Sing* (1916) and *Songs to Sing to Children* (1935). Children’s games and songs (and other folklore) were also included in such expansive studies as *The Frank C. Brown Collection of North Carolina Folklore* (1952–1964) (especially Volume 1 edited in part by Paul G. Brewster), and Carl Withers’ *Plainville USA* (1941) and subsequent works.

As the study of songs and games continued, the study of children’s folklore in general began to broaden. Among the few examples that must stand for a great many books and articles, Brewster’s *American Nonsinging Games* (1953) was the first large study of nonsinging games. The 1950s also saw the publication of Iona and Peter Opie’s *The Lore and Language of Schoolchildren* (1959), which gives nearly as much space to customary behavior as to oral traditions. Martha Wolfenstein’s *Children’s Humor: A Psychological*

Analysis (1954) is important for the depth of analysis her narrow focus allowed, and John McDowell's *Children's Riddling* (1979) is similarly tightly focused, both in region and in genre. Mary and Herbert Knapp's *One Potato, Two Potato: The Secret Education of American Children* (1976) helped open the way for serious consideration of children's gross and obscene humor. Margaret K. Brady's "SomeKindof Power": *Navajo Childrens SkinwalkerNarratives*" (1984) looks at Native American children's lore, and Bessie Jones' and Bess Lomax Hawes' *Step It Down: Games, Plays, Songs and Stories from the Afro-American Heritage* (1972) looks at the lore of African American children. Simon J. Bronner's *American Childrens Folklore* (1988) continues and balances most of these trends; he deals with a wide variety of children's folklore (including one of the few substantial surveys of material traditions available), makes some cogent, in-depth analyses, and provides an excellent bibliography

arrived immigrants to families who have been established in the United States for several generations.

The majority of the earliest Chinese immigrants came from Guangdong Province in southeast China. Fleeing from war and inflation, and enticed by news of discovery of gold in California in the 1840s, more than 300,000 arrived between 1850 and 1882, settling in California, Oregon, Washington, Idaho, Montana, and Colorado. Chinese laborers played a crucial role in the development of the West, reclaiming marshes, mining minerals, farming, fishing, and building tunnels, bridges, and roads, as well as the Central Pacific Railroad that made large-scale transcontinental travel possible. Among

the immigrants was a small group of merchants—wealthier and better educated than the majority who were peasants—who held more social and economic power in the new society.

Racial discrimination and an economic crisis in California contributed to an anti-Chinese movement that severely restricted Chinese immigration, naturalization, and legal rights of Chinese Americans, culminating in the passage of the Exclusion Act of 1882. The exclusion acts were not repealed until 1943. As hostility intensified during the 1880s and 1890s, Chinese immigrants left rural areas and congregated in larger towns; many of these settlements later became “Chinatowns.”

Nineteenth-century Chinese American society was primarily a bachelor community. A network of kinship and village ties formed the basis of a social structure that substituted for the traditional family unit. Family associations brought together people with the same surname, while district associations brought together members from the same geographical region in China. The association lodge functioned as a multi-service community center and the focus of a surrogate family.

Religion provided spiritual comfort to lonely men living in a foreign and often hostile land. Most practiced folk beliefs that sought the protection and assistance of various gods and patron deities with whom they were familiar from south China. The creation of a relatively homogeneous concentrated community made possible the retention and adaptation of Chinese cultural practices. The traditional Chinese worldview was a combination of elements of folk belief with Daoist, Buddhist, and Confucian teachings. This included belief that those in the spirit world have the power to intervene and to assist in the affairs of the living, and that there exists a continuum and an interdependency between the dead and the living. Prayers were addressed to ancestors, seeking assistance in curing diseases, averting calamities, and bringing prosperity and happiness to descendants. In return, spirits of the deceased needed to be nurtured, ritually fed, and made to feel a part of the living world. The seasonal festivals helped strengthen this bond.

From the late 1880s through the turn of the century, dozens of temples—from wayside shrines and simple wooden structures in rural communities to large and elaborate com-

munity temples—were built throughout the West, in Hawaii, and in such Eastern cities as New York and Philadelphia. Many reflected the use of Chinese geomancy, or *feng-shui* (wind and water), and were situated near water sources or at the edge of settlements.

When an individual wanted to communicate with the deities, seek guidance, protection, or success in his business venture, or express appreciation for good fortune, he visited the temple. Incense sticks to purify the air, candles to illuminate, and paper money for use in the spirit world were burned as offerings to the patron deity. In addition, temples offered fortune-telling services. Businesses maintained small altars for Guan Gung, regarded by merchants as a god of wealth and fidelity in business transactions. Patron deities were based on historical individuals who had led exemplary lives and were later deified. For example, Guan Gong was a warrior known for his loyalty and popularized through the Ming-dynasty novel *Romance of the Three Kingdoms*; Tien-Hou (Empress of Heaven) lived from A.D. 960 to 987 in Fujian Province, and was later known for her spiritual ability to guide seafarers safely home through storms.

The early immigrants brought genres of Cantonese folksongs, including the *muk-yu* (wood-fish) cantefable (or chantefable) form. Marlon K.Hom describes its structure and content:

Chantefables were performed by a storyteller who chanted in rhymes, sometimes interspersed with spoken speech, and accompanied by musical

instruments—a string instrument, a small bell, a pair of wooden clappers, a wooden block, or simply the clapping of hands. The muk-yu chantefable consists of stories derived from historical figures and popular legends. While some pieces are humorous and entertaining, many are melancholic complaints about hardship and suffering, loneliness, and separation. The emigration of the Cantonese native to the United States provided additional topics, particularly on the sorrow and lamentation of forsaken wives left behind at home. One common feature among these chantefables is a didactic and moralistic overtone. (Hom 1989)

Seasonal festivals, based on the lunar calendar, were important social events for Chinese Americans. Most important of these was the New Year; it marked a time of renewal, a time to clear debts, visit friends and relatives, drive away bad spirits, and usher in good luck for the coming year. Local communities organized parades that staged lion and dragon dances amid thundering firecrackers, instrumental bands, floats, banners, and lantern processions. Chinese American merchants held open house, preparing a table of treats for the larger American community. Smaller festivals that were observed included Quin Ming (pure and bright) rites for the deceased in April, Dragon Boat races commemorating patriot Chu Yuan in June, and mid-autumn family reunions in September. Special foods were associated with each festival, and several festivals had public as well as private dimensions, being expressions of both community and ethnic pride. At the same time, communities made it clear that they had become part of American life, so they participated in pan-American events such as July fourth parades.

Annual birthday celebrations for the principal deity of a community temple featured offerings to the deity, a procession in which a figure of the deity was paraded through the streets, and an opera performance to entertain both the deity and the public. The town of Point Alones in Monterey Bay, California, held an annual Ring Game honoring the God of Wealth, from 1894 to 1904. The climax of the event was the firing of “bombs” (woven bamboo rings) into the air from a giant firecracker and the ensuing struggle for the rings by large crowds. It was believed that whoever secured a ring was blessed with luck and wealth for the coming year. The Marysville, California annual temple festival during the second lunar month celebrated the birthdays of both Bok Kai and a regional earth god, marking the emergence of a dragon from slumber to oversee rains bringing forth a new agricultural season. The Ghosts Festival in the eighth lunar month aimed to appease the wandering souls of those who died without a proper burial because they had died far away from home, had left no descendants, or had died violently. If left unattended, these spirits could harm the living. Occasionally, communities also held a *jiao* ritual, such as occurred after a natural disaster hit Sacramento, California, to appease and dispel ghosts that caused such happenings.

The funerals of early Chinese pioneers were swift and simple. As communities gained stability, numbers, and wealth, the funerals resembled those practiced in south China—with ritual offerings, professional mourners, public processions, and annual grave visits. While many dead were buried in Chinese sections of American cemeteries, it was believed that their spirits would not be at rest after death without the proper and regular ministrations of their families. Twice a year, during Quin Ming in the spring and the Ghosts Festival in the autumn, family and district association members swept graves,

planted flowers, burned incense, and offered food and drink to nourish the spirits of the deceased. Usually, after a period of seven years, graves were opened, the bodies exhumed, and bones packed and shipped to China for permanent reburial in native villages. An adaptation of Cantonese mortuary rites, this practice of reinterment in China continued until World War II.

Chinese herbal medicine was practiced, and specialists such as “Doc Hay” of John Day, Oregon, established successful medical practices, restoring patients to the proper “physical balance.” Apothecaries, walls lined with drawers containing herbs, were staffed with herbalists to dispense prescriptions for customers.

Chinese opera, a dramatic form that combines elements of movement, dialogue, singing, and combat, was probably the most popular entertainment among the Chinese working class. Throughout the 1860s, there was at least one theater operating full time in San Francisco’s Chinatown; in 1897 the first building was constructed specifically for Chinese theater. Opera clubs later served as centers for social and recreational activities. Visiting troupes featuring well-known actors were booked into theaters for one week to ten days; local opera-club members fleshed out the rest of the cast or provided musical accompaniment. Amateur participation in performances as a personal means of artistic expression still has an extensive tradition in China. The 20th century saw the growth of amateur musical clubs and ensembles, such as the Nam Chjung Musical Society located in San Francisco, in which Cantonese opera continues to be performed and practiced today. More than a dozen music clubs practicing Cantonese opera, Peking opera, and instrumental music exist in the San Francisco Bay area.

Several factors contributed to the diminished practice of traditional religions and festivals after the 1920s. With the emergence of a new republic in China in 1911 that replaced 2,000 years of dynastic rule, Chinese American leaders sought to construct a new image of the Chinese as a “modern” and “progressive” community. As American-born Chinese became urbanized and acculturated, they struggled with the challenge of maintaining their ethnic heritage while adapting to the mainstream of American culture.

The abolishment of the discriminatory immigration-quota system and the enactment of the 1965 Immigration Act increased immigration sharply from Taiwan and Hong Kong, bringing in more students and middle-class families. Since the normalization of U.S. relations with the People’s Republic of China in the 1970s, people have also emigrated from mainland China, as well as ethnic Chinese refugees coming from southeast Asian countries. These new immigrants have revitalized Chinese American communities, increased the demand for cultural activities, and enriched the membership of cultural organizations by introducing new and diverse talent, repertoires, and regional styles.

The rising ethnic awareness of the 1960s fueled the creation of numerous community-based organizations. New immigrants filled the ranks of instrumental music, opera, folkdance, shadow-theater, and choral and visual-arts organizations, either as participants, audience members, or educators. In some cases, patrons have recruited and sponsored master performers for long-term residencies of coaching and directing positions.

In more recent years, several Chinese American cultural organizations have developed folklife programs within their research, exhibition, and public-program initiatives. The Asian American Art Centre in New York, for example, exhibited wood-block prints of Chinese door gods in the 1980s and hosted lunar New Year workshops featuring folk

artists teaching such crafts as paper cutting, wood-block printing, and dough-figure construction. Impetus for such programs comes from concern about how contemporary art is connected to the past and to a community, a tradition, or a lifestyle.

The Chinatown History Museum in New York City salvaged a Cantonese opera collection—instruments, costumes, scripts, and props used by the Chinese Musical and Theatrical Company since the 1930s—that was just being thrown out. Museum staff recorded oral histories from club participants, and they cataloged and conserved the collection. In its earlier years, the museum documented the occupational folklife of laundry workers. San Francisco's Chinese Culture Center has organized exhibitions of Chinese folk arts and lunar New Year programs. The Chinese Historical Society of America, in addition to mounting exhibitions, has published books and a periodical, *Chinese America: History and Perspectives*, that include aspects of the folklife of early Chinese Americans.

The arrival of traditional artists increased community access not only to high-quality performances, but also to apprenticeships and educational programs. Zhushan Chinese Opera Institute, based in the Washington, DC, area, for example, offers opera classes to young people enrolled on weekends in Chinese American language schools.

The recognition of master folk artists through the National Heritage Fellowships of the National Endowment for the Arts' folk-arts program—Ng Shueng-Chi, Toissan *mukyu* folk singer, and Liang-xing Tang, pipa player—has provided visibility and support to community programs, while federal, state, and local grants to organizations make it possible for scholars to participate in research-based public programs that engage both Chinese- and English-speaking audiences.

Chinese American seasonal festivals continue to be practiced—both family-based and public celebrations—the most important of which is the lunar New Year. In 1990 the Los Angeles Chinese American community produced a Moon Festival as part of the larger Los Angeles Festival that brought attention to the multiethnic nature of the city, reviving a tradition last practiced in 1947. The festival featured performances by martial-arts, folk-dance, opera, and instrumental ensembles; it included folk artists' workshops, mooncake demonstrations, and storytelling. The festival culminated in a harvest-moon banquet, with a lantern procession and a moon-viewing party via telescopes placed in a schoolyard. While the program was a marker of ethnic identity, it also introduced a new element of cross-cultural programming. Storytellers, for example, introduced audiences to repertoires of tales about the moon from several diverse cultural traditions and perspectives. Chinese Americans' folk practices will continue to change as they negotiate their ethnic identity and relate it to the larger complex American society.

Christensen, Abigail Mandana (“Abbie”) Holmes (1852–1938)

Collector of African American folklore of the South Carolina Sea Islands. Born in Massachusetts, Holmes moved to South Carolina with her abolitionist parents during the Civil War. She published stories and a book of African American dialect tales in the 1870s and 1890s and was a proponent of the African origins of Southern Black folklore.

Holmes heard the stories of Br'er Rabbit and the others of “de beastises” told by formerly enslaved African Americans as she matured into adulthood in Beaufort, South Carolina. While a student at Mount Holyoke Female Seminary, she published “De Wolf, de Rabbit, an’ de Tar Baby” in a Massachusetts newspaper in 1874. Thereafter, she contributed several tales in the Sea Island dialect to the New York *Independent*. After she married in 1875, she wrote under the name Mrs. A.M.H.Christensen. In 1892 Christensen published a collection of dialect stories entitled *Afro American Folk Lore Told Round Cabin Fires on the Sea Islands of South Carolina*. She belonged briefly to the American Folklore Society and wrote a paper on African American spirituals and shouts that was read at the 1893 World’s Columbian Exposition in Chicago and published in the *Journal of American Folklore* the following year.

Christensen believed she should use the profits from the sale of her book on behalf of African Americans. Starting with a modest sum, she worked with other Whites and Blacks to found the Port Royal Agricultural School for African Americans in 1902. Christensen was also an early advocate of women’s suffrage, temperance, and socialism.

Christeson, Robert Perry (1911–1992)

Fiddler, fiddle-tune collector, and scholar. Christeson was born in Dixon, Pulaski County, Missouri, at a point in time and space, as he noted, in which old-time fiddling and square dancing flourished and were integral components of social life. He was drawn to the fiddle as a young boy, and as a teenager he schooled himself in the characteristics of Missouri old-time fiddling by attending dances in Dixon and surrounding communities.

After working his way through the University of Missouri in Columbia, Christeson worked as an assistant county agent, county agent, and a resettlement administrator, and in other offices in northeast and southeast Missouri and the Ozarks region, learning about fiddling styles in different areas of the state. Service in the U.S. Army during World War II and as a statistician in the Livestock Reporting Section of the U.S. Department of Agriculture took him away from Missouri for almost three decades, but at every opportunity he returned to his study of Missouri fiddle music. He began his historic field

collection in 1948 by recording Bill Driver, a black fiddler he had first heard two decades before.

In 1970 Christeson returned to his home state and settled in Auxvasse in Callaway County. His retirement years were devoted to preparing his fiddle-tune collection for publication and promoting old-time Missouri fiddling. Both his first volume of fiddle tunes, accompanied by an album of forty-one field recordings, and the second volume were highly praised for the quality of the editing and the significance of the material.

Although reluctant to play his fiddle unless he felt up to his own exacting standard, Christeson shared his enthusiasm and knowledge at a number of festivals and workshops during the 1970s and 1980s. His work as collector, old-time fiddler, and scholar was largely responsible for the renaissance of old-time Missouri fiddling that has occurred since the mid-1980s. Toward the end of his life, he participated in the production of *Now There's a Good Tune*, the award-winning album in the Masters of Missouri Fiddling Series published at the University of Missouri.

Christmas

Christian holy day and secular holiday. The early Christian church was ambivalent about celebrating the birth of Jesus. Some church leaders, in fact, disapproved of acknowledging the occasion at all. Moreover, since canonical accounts do not

specify a date or even season for Jesus' birth, early celebrations occurred at various times. Eastern churches began to focus their observances on January 6, now the Feast of the Epiphany, which commemorates the visit of the Magi to the infant Jesus and is still sometimes referred to as "Little Christmas." The Western church, though, selected December 25 to commemorate the nativity, probably because the date coincided with winter-solstice celebrations. That date has become generally accepted throughout Christendom, except among adherents of the old Julian calendar, who observe Christmas on January 7. For most modern Americans, the Christmas season actually begins several weeks before December 25 and climaxes during the week between that date and New Year's Day.

The first Christmas observance in what is now the United States probably occurred in Jamestown, Virginia, in 1607. The New England Puritans were less hospitable to the holy day, and, in fact, Massachusetts temporarily outlawed its observance. Such regional differences have continued to figure in American Christmas traditions, even though nationwide customs now dominate the celebration. The varied ethnic heritages represented in the United States also contribute to some diversity in American Christmas festivities.

That Christmas has been recognized as a holiday by federal and state governments since the 19th century has contributed to the development of a nationwide Christmas culture, adapted, in part, from specific regional and ethnic traditions. Customs focus

overtly on Christmas' religious significance and on its more generally festive aspects. An example of the former is the nativity scene. Though some courts have ruled that placing nativity scenes in public places violates the constitutional prohibition of government-sponsored religion, many businesses, churches, and residences (either on the front lawn or in a special place indoors) display figures of Jesus' parents, the child himself, animals appropriate to a stable setting, angels, shepherds, and the Magi. Most nativity scenes use statues, but churches may have amateur actors assume the roles for at least a few nights during the Christmas season.

A widely known custom with fewer religious overtones involves the Christmas tree, reputedly brought to America by Hessian soldiers during the Revolutionary War. Using a decorated evergreen as the centerpiece for a home's holiday decorations became widespread during the mid-19th century and received official sanction when President Franklin Pierce erected a Christmas tree in the White House in 1856. Other widely practiced Christmas customs in the United States, religious and secular, include exchanging gifts, identifying Santa Claus as the festive spirit of the season, mailing greeting cards, holding special public programs such as parades, and attending special church services.

Though many have spread to other parts of the country, distinctly regional traditions also continue to characterize American Christmas celebrations. For example, such customs as fox hunts on Christmas morning, the greeting phrase "Christmas gift," and fireworks developed in the Old South, where the season provided unwonted respite from labor even for slaves. In Louisiana, bonfires continue to be lit on Christmas Eve. In the west Texas community of Anson, an annual Cowboys' Christmas Ball commemorates an event first held in 1885.

In the Southwest, Hispanics and Latinos continue to practice ethnic Christmas customs. They decorate with *luminarias* (lighted candles set in sacks of sand), perform folk plays such as *Los Pastores* that combine traditional piety with broad comedy, and participate in *Las Posadas*, which dramatizes the search by Mary and Joseph for shelter. Among Germans in Pennsylvania, children have traditionally awaited the arrival of the Belsnickel, a figure who, like the more widely known Santa Claus (probably a Dutch import), brings gifts to those who have behaved themselves. But he also carries a switch to punish the naughty. Ethnic foods figure into Christmas menus. For Italian Americans, the Christmas Eve vigil has required dinners consisting of an odd number of meatless dishes, eel being a special favorite. Italian American bakers also prepare festive cookies such as *biscotti*, *pignollati*, and *cuccidati* for the holiday season.

National Christmas traditions have replaced some holiday practices that once flourished in regional and ethnic communities. Examples include the mummers' plays, which survived in pockets of British settlement such as the southern Appalachians, and some folk carols. Many communities, though, have begun to revive and preserve distinctive customs to complement the national Christmas culture, which they view as lacking in spirituality and oriented toward material consumption.

City Lore

New York Center for Urban Folk Culture. City Lore is the first organization in the United States dedicated specifically to the documentation, preservation, and presentation of urban folk culture. The organization had its genesis in 1978 when a group of New York City-based folklorists founded the New York City chapter of the New York Folklore Society and in the following years sponsored a series of conferences on urban culture: *The Folklore of New York City* (1979), *The Folklore of Urban Public Spaces* (1980), and *The Folk Culture of the Bronx* (1981).

In 1986 Steven Zeitlin, then president of the chapter, worked to incorporate the group under the name *City Lore*, and he became its first director; Barbara Kirshenblatt-Gimblett became the first board president. Unlike the statewide folklore society from which it emerged, City Lore had the mission to document urban culture exclusively. In exhibitions such as *City Play* and “Welcome to Your Second Home”: *New York City’s Ethnic Social Clubs*, the organization has explored a number of themes characteristic of the urban environment. These themes, some of which were originally mapped out by Kirshenblatt-Gimblett in her essay “The Future of Folklore Studies in America: The Urban Frontier,” include the folk imprint on the built environment, customizing mass culture, and the process of traditionalizing as it continually transforms urban cultures.

City Lore is conceived as a collaborative effort through which folklorists, anthropologists, historians, and filmmakers apply for grants and develop projects on urban folk culture and cultural history. It has explored urban phenomena such as graffiti, New York’s memorial walls, the history and culture of Coney Island, lawn shrines, city-based gospel music, Christmas lights, and urban pageantry, including the Italian *giglio* celebration and the West Indian Carnival. City Lore advocates for endangered local establishments and cultural sites crucial to their communities; houses a leading photographic archive of urban ethnic culture, primarily by photographer Martha Cooper; sponsors the annual City Lore Festival of Folk Cultural Film and Video, a major showcase for films on American folklore and folklife; honors grass-roots contributions to folk culture with the People’s Hall of Fame awards; and has taken a leading role in folk arts and education, organizing the conference “Folk Arts in the Classroom” for the National Endowment for the Arts in 1993.

City Lore is located at 72 East First Street, New York, New York 10003; its telephone number is 212-529-1955.

Civil War

War between the Union (North) and Confederacy (South), 1861–1865. Traditional processes, genres, and contexts of folkloric creativity arose out of the American Civil War, or “War between the States,” experience. Songs like “Dixie,” legends and family narratives, and commemorative forms have left their mark on American folk culture to the present day. An event as powerfully definitive as the American Civil War is bound to make an enormous impact on a people’s expressive culture. In the Civil War period, folk expressive traditions were richly intertwined with popular literate traditions of the day. This is particularly true in the area of music but also holds for narrative and verbal art.

The musical culture of the Civil War period was strong and varied. In this era before the age of mechanical reproduction, the majority of people engaged in music making. People drew both from the continuing unwritten folk musical traditions they were part of and also from the popular music of the day with its lively sheet-music and broadside industry. What people actually sang, played, and danced to was a blend from these sources.

Probably the most famous songs to come out of the war were the rallying songs and anthems of the conflict; “Dixie,” “The Bonnie Blue Flag,” “John Brown’s Body,” “Maryland, My Maryland,” “Marching through Georgia,” and “The Batde Cry of Freedom” are some of the best known. All of these songs were original compositions (often based on traditional melodies) that were quickly embraced by participants, who modified and changed the words to better express their perspectives on the situations they found themselves in. Thus, Union soldiers sang “Northern” versions of “Dixie,” and Southern women sang an adaptation of “The Bonnie Blue Flag” called “The Homespun Dress” that expressed the hardships of the time from a woman’s perspective and has remained popular in the folk tradition.

The rival army camps were fertile grounds for folkloric musical creativity. “All Quiet along the Potomac,” “Lorena,” “When Johnny Comes Marching Home Again,” “Home Sweet Home,” “Tenting on the Old Camp Ground,” and other tragic and sentimental songs were widely sung. Other songs had less serious themes, including the humorous “Goober Peas” and the drinking song “Drink It Down.” Glee clubs, impromptu string bands, minstrel troupes, and military brass bands performed regularly in the camps. The routines of camp life, reveille, dinner calls, sick calls and musters were all subject to parody and witty musical embellishment. In the Northern Army, the different ethnic groups such as Germans, Italians, and Irish contributed to the musical mix with songs from their own traditions.

The war also proved to be a rich source of material for the Anglo American ballad tradition. Several ballads have been collected that recount aspects of the naval action surrounding the *Monitor* and the *Merrimac*. “The Batde of Shiloh” adapts a traditional British ballad, “The Heights of Alma,” to comment on the glories and horrors of that engagement. “Fare You Well My Darling” recounts the sad farewell of a soldier from his wife.

For Black Americans, the war had a different significance than for their White counterparts. In the Black tradition, the Civil War stood as a redemptive moment, the long awaited call to freedom. This is humorously marked in a line from an improvised work song recorded by anti-slave activists in Port Royal, South Carolina: “De Nordimen Dey’s Got Massa Now, Glory Hallelujah.” For Blacks, narratives focused on emancipation and the countless scenes at the end of the war when their freedom was announced. In dozens of oral histories of former slaves, this scene is recounted and signals a turning point in both collective and personal history.

For White participants, oral forms were more varied, reflecting a greater range of experiences. The camps once again were the point of origin of much of this folklore. Although much of the folk humor of the war remains undocumented because of the sensibilities of this period, a good deal remains, found in the many letters, diaries, and reminiscences that were written. “Here’s your mule” became a standard joke in the Southern camps, a greeting whose origin lies in the wit of a soldier who pointed out a bedraggled comrade in his tent to another soldier searching for his animal. Soldiers “fined” each other “muggins,” bottles of whiskey, for making cracks about the privations of camp life.

The process of legend dissemination began to be greatly influenced by print media in this period. Colorful incidents focusing on the great leaders of the period—Lincoln, Lee, Grant, Sherman, Stuart, McLellan—were circulated orally in the camps and picked up on by reporters, who further embellished them and broadcast them to the larger public where again these stories were retold. In the context of the camps, where spare time, lack of solid information, and anxiety intermingled, rumors enjoyed a vigorous life. Assassination plots, peace, and foreign intervention were favorite topics of speculation.

Particularly in the regions where the war was fought, legends have persisted about incidents of the war. Personal-experience narratives became family narratives and legends fueled by the powerful themes of ambivalence of loyalty, personal hardships, and acts of courage. Many of these narratives focus on the strength of women in the face of the horrors and injustice of war. A common theme of these stories is the bravery or guile of household members responding to raiders and bushwhackers. Many a great aunt has been celebrated for taking the law into her own hands at the rough treatment her household received.

Along with these verbal forms, the memory and meaning of the war continued in other genres. For Blacks coming from the east Texas area, Juneteenth celebrations are important commemorations of emancipation. Veterans of the war donned their uniforms, marched in parades, and encamped at battlefields on important holidays and anniversaries of battles. Civil War reenacting, a recent form, provides opportunities for folkloric creativity and has become a tradition in its own right, interacting with preserved spaces, history education, movies, and video documentaries like Ken Burns’ PBS (Public Broadcasting System) series *The Civil War* to keep the war alive as part of the national imagination. Finally, the Confederate battle flag has become a powerfully contested symbol reflecting the continuing struggles for cultural definition in contemporary society.

Coding in American Folk Culture

Communicating through a set of signals—words, forms, behaviors, signifiers of some kind—that protect the creator from the consequences of openly expressing particular messages. (This specialized definition is distinct from the use of “code” simply to designate the system of language rules through which communication is possible.) Coding occurs in the context of complex audiences, in situations in which some of the audience may be competent to decode the message, but others—including those who might be dangerous—are not competent (or not willing) to do so.

Although coding may be undertaken as play (children’s “pig latin,” for instance) or to preserve privacy (signals between lovers, or immigrant elders using their mother tongue when children are around), much coding takes place in situations of significant risk. The traditional creations and performances of dominated cultures often contain covert expressions of resistance—ideas, beliefs, experiences, feelings, and attitudes that the dominant culture would find disturbing or threatening if expressed in more overt forms. Slave songs may express a secret wish for freedom; a gay man’s conversation may conceal his assertion of sexual preference; a wife’s knitting may coverdy protest her husband’s assumption that his activities are more significant than hers.

Three kinds of coding—explicit, complicit, and implicit—may be distinguished. In cases of explicit coding, the presence of a code is obvious even to those who cannot decipher it—a dangerous matter in situations of great risk. A letter written in cipher, for instance, announces itself as containing a secret, and thus can invite efforts to decode. In situations of complicit coding, however, the existence of a code is concealed from those outside of the coding group. The code and its uses are collectively determined ahead of time (passwords, code names, a sheet hanging on a clothesline to indicate safe passage on the underground railway) or are drawn from esoteric experience and adopted on the spot (a lesbian’s naming of a local women’s bar; a Jewish American’s conversational use of a Yiddish word). Complicit coding is consciously employed among members of a folk group united by a shared culture and a shared sense of threat.

Both explicit and complicit acts of coding are manifestly intentional, undertaken knowingly and purposefully. However, coding need not be deliberate. In the third type, implicit coding, even the existence of a coded message is arguable and may be denied by the creator; not only the message, but coding itself is concealed and may be subconscious.

Implicit coding thus raises complex questions about intentionality and about the interpretations that may be constructed both by the original receiving community and by outside observer-analysts such as folklorists. A woman who sews a quilt patch in which Sunbonnet Sue, a traditional pattern figure representing feminine submissiveness, diligence, and innocence, is swallowed by a snake may dismiss her creation as “just a joke”; inferring from contextual knowledge rather than the quilter’s assertion, however, an audience might see an encoded message of feminist resistance to a traditional stereotype. The interpretation of implicit coding often presents a dilemma, since there is

neither the signaling of an intention to code nor any open complicity in a coding system; in fact, the performance is meant to pass for an uncoded activity. With careful and respectful scholarship grounded in the specific cultural context of the performance, however, it is feasible to posit at least the possibility that an act of coding has occurred. A context for concealed coding (complicit or implicit) exists when, for a particular individual or folk group, there exists a situation of oppression, dominance, or risk; when there is some kind of opposition to this situation that cannot safely be made explicit; and when there is a community of potential “listeners” from which one would want to protect oneself. However, the identification and interpretation of implicit coding must ultimately remain an act of inference—inference that has potentially serious consequences for individuals and communities and should not be undertaken without care.

The coded status of individual texts and performances will often remain ambiguous, and different audiences may disagree as to their interpretation. Nevertheless, it is possible to designate the following strategies of expression that lend themselves to the complicit or implicit coding of messages:

Appropriation: adapting to the purposes of oppressed culture forms or materials normally associated with the dominant culture (example: Native American “riffs on the White world” through adaptation of traditional beadwork to decorate such popular mainstream items as baseball caps, Bic pens, and Bingo markers).

Juxtaposition: ironic arrangement of texts, artifacts, or performances so that they develop additional, often tendentious, levels of meaning (example: a wife braiding a foot-wiping rug for the front doorway from pieces of her husband’s old suits).

Distraction: strategies that drown out, or draw attention away from, the subversive power of a message (examples: singing lyrics expressing fear or protest in a soothing lullaby; “passing” as a member of the mainstream—a gay man in the military, for instance, emulating masculine stereotypes and taking part in “locker room” talk).

Indirection: the many ways in which, as Emily Dickinson put it, one can “tell all the truth but tell it slant.” Perhaps the most common strategy of coding, indirection includes metaphor, impersonation, hedging, and metonymy (examples: Mexican American women telling legends of vaginal serpents as metaphoric expressions of sexual fears; Kentucky mountain women singing traditional Anglo American ballads as impersonal lessons about how to outsmart men; lesbians making metonymic inquiries about the sexual orientation of strangers by asking if they have been to the Michigan Women’s Music Festival).

Trivialization or Minimalization: strategies that understate, minimize, or “normalize” the subversive power of a message, sometimes by employing forms that the dominant culture considers to be unimportant, innocuous, or irrelevant (Examples: telling a joke to express criticism; downplaying the seriousness of conversation by giving it a traditionally disparaging label, such as “gossip,” or “woman-talk”).

Incompetence: expressing resistance to the dominant culture’s expectations by claiming or demonstrating incompetence at activities conventionally associated with one’s oppressed culture; associated with underclasses of workers whose labor power is being exploited (Example: a woman claiming she “can’t cook”).

Cold War

Period of an incessant nuclear-arms race between the United States and the Soviet Union. The detonation of atomic bombs over Hiroshima and Nagasaki in Japan in August 1945 froze international politics into what became known as the Cold War. The post-World War II era presented the everyday reality of nuclear warfare and ushered in decades of terror, tension, and anxiety that permeated American popular culture and folklore. A policy of secrecy encouraged rumors and legends.

Although sparked by the A-bomb, the Cold War matured in the 1950s with the outbreak of the nonnuclear Korean War. During this decade, an “Iron Curtain” separated East Europe from the democratic West. Political crises in Hungary, the Suez, and Lebanon, as well as the erection of the Berlin Wall, escalated the Cold War, and possibilities of World War III loomed ominously.

Atomic weaponry symbolized the Cold War era. Both the United States and the Soviet Union stockpiled thousands of intercontinental missiles, prepared to launch them in a policy of immediate massive retaliation. Sophisticated technology, including radar, computers, and nuclear-powered submarines, complemented the weaponry.

Cold War culture, dominated by technological-oriented themes, stressed dehumanization, surrealism, alienation of individuals, and the absurdity of a military government with too much power. Good versus evil permeated the lore of the postwar period.

In what has been called the “folklore of capitalism,” Americans became a consumer society, enjoying the affluence of the 1950s. Ranch houses, suburbs, and education financed by the GI Bill symbolized the mythic “American Dream” of prosperity, security, and a perfect society. The baby boom assured the demographics considered necessary for supremacy in the world.

Americans clung to past traditions to counter insecurities and uncertainties; for example, a major weapon systems, the Minuteman missile, were named after historical precedents. Americans embraced conformity, while in the Soviet Union a propagandistic pseudofolklore, praising the Soviet government and Joseph Stalin, disseminated official Communist ideology.

Many Cold War stories involved military themes, as civilians pondered such questions as whether the United States would be invaded by Cuban dictator Fidel Castro after the Bay of Pigs fiasco. The capture by the Soviets of U2 pilot Gary Powers in 1960 spurred rumors about America’s spy-plane capability. The secrecy of the American military program led to exaggerated speculations about the types and size of weaponry both sides possessed.

Nuclear consciousness pervaded American folk popular culture. Radioactive warning signs, the silhouette of Three Mile Island, and pictures of mushroom clouds represented the hysteria of the Atomic Age. Bartenders concocted atomic cocktails, and children purchased atomic rings and played A-bomb games on the playground. Popular magazines

printed cartoons and jokes about the bomb, and Cold War slang terms such as “Ground Zero,” “bikini,” and “Catch-22” entered American jargon.

Examples of “Grandmas Pantry,” as the home bomb shelters were sometimes termed, proliferated. The Soviet Union’s detonation of an atomic bomb in 1957 spurred doomsday-oriented stories in which the threat of nuclear war was often compared to an attack by carnivorous animals. Folktale themes stressed unbeatable power not peaceful coexistence. The mythical red button and the telephone hotline in the president’s office became the focal point of holocaust scenarios, especially during the 1962 Cuban missile crisis. Rumors of secret underground bomb shelters in the Pentagon and the White House suggested that the government would abandon the common people. Atomic monsters, whether mutations or metaphorical imagery, represented the fears of the Nuclear Age.

It might be said that aspects of folk culture in the 1960s became the coumerculture, incorporating peace signs, psychedelic art, hippie clothes, and protest songs that were more or less “folk.” Antiwar protests, sit-ins, and the free-speech movement fought authority. The Vietnamese War’s folk culture included decals and bumper stickers, depicting peace symbols and American flags, either placed with respect on construction helmets or worn on the seat of the pants by war protesters. This war for self-determination entered the American consciousness by being shown on television daily, and, of course, the soldiers fighting in Vietnam developed their own brand of wartime folklore.

The Camelot administration of President John F. Kennedy (1961–1963), who admonished Americans to discover “what you can do for your country,” introduced new themes of lore, and conspiracy theories abounded to explain the president’s assassination in November 1963 as well as the deaths of other prominent people, including actress Marilyn Monroe. Activism and the social programs of the 1960s War on Poverty inspired new bohemian and beatnik folk culture by singers thought of by the public as traditional folk singers, such as Joan Baez.

The 1957 Soviet Sputnik satellite spurred the creation of NASA (National Aeronautics and Space Administration) and the American effort to explore space. The United States landed men on the moon, a fact disputed by some who claim the television footage was actually filmed secretly on earth. The Space Age encouraged numerous UFO (unidentified flying object) sightings and movies, and even defense programs adopted such pop-cult space themes as “Star Wars.”

During Cold War flare-ups in the 1970s and 1980s, nostalgia for the 1950s revived folklore from that period, but the later decades reintroduced affluence, materialism, and narcissism, with an accompanying body of modern folklore. Jokes and anecdotes about Watergate, the “third-rate burglary” that led to the impeachment of President Richard M. Nixon in 1974, materialized at office water coolers. Legends of folk saints, miracles, and answered prayers resurfaced as Middle East conflicts and terrorism brought new dimensions to the Cold War. Yellow ribbons represented Americans anxiously awaiting the return of loved ones held hostage in Iran or fighting in the Gulf War in 1991, and red ribbons symbolized the loss of murdered children and also AIDS victims. POW-MIA (“prisoner of war” or “missing in action”) bracelets signified the hope that rumors of lost prisoners in Asia being located were true.

During the period of the Cold War, graffiti painted on the Berlin Wall and stories about East-to-West escapes persisted as expressions of resistance, but with the fall of the

Berlin Wall in 1989 and the collapse of the Soviet Union, the Cold War thawed considerably, having established a folklore tradition to initiate the 21st century.

Columbus Day

October 12, a legal holiday in most of the United States, commemorating the landing of Christopher Columbus in the Bahamas in 1492; now usually observed on the second Monday of October. Christopher Columbus was rarely mentioned in American chronicles before the era of the American Revolution. Then between 1775 and 1792, he emerged as a full-fledged American hero, the central figure in a national-origin myth that stressed America's separateness from Europe and the expansive future that seemed open to the "new and rising empire" of the United States. American nationalists of the 1790s created the Columbus Day observance, erected the first Columbus monuments, and scattered the admiral's name in both its latinized and feminized forms across the national map. Succeeding generations embedded his story in admiring biographies and in schoolbooks and enshrined it in poetry and art. Most schoolchildren know the rhyme, "In fourteen hundred and ninety-two/Columbus sailed the ocean blue."

The fact that Columbus never set foot in North America and died unaware of its existence meant that he was not identified with any one state or section of the country. This made him all the more suitable as a symbol of the revolutionary generation's aspiration to national unity and continental expansion. The late 19th century saw the emergence of Columbus as a hero of cultural pluralism, as Irish Catholics and Italian Americans emphasized religious and ethnic dimensions in Columbus' story that earlier generations of Yankee admirers had more or less overlooked. Italian Americans took the lead in this work, but they had important assistance from the Knights of Columbus, an Irish Catholic fraternal organization founded in New England and renamed in Columbus' honor in 1882, and from the "Americanist" wing of the nation's Roman Catholic hierarchy, bishops who worked to reform the American church and to promote the church as an assimilating agency training immigrants for democratic citizenship. As a result, the celebration of ethnicity became the dominant theme in the Columbian tradition during the 20th century.

Italians, as is well known, did not bring national, but rather regional, identities to the Americas, and so it was the Ligurians among them who began the refashioning of Columbian traditions. First in New York (1866) and then in San Francisco (1869), Ligurian immigrants rallied their *connazionali* to the process of "italianizing" the Yankee Columbus Day, turning it from an occasion of solemn assemblies and oratory into a festival of parades and banquets. Columbus became an ethnic hero—and his holiday an amalgam of a tra-

ditional Italian Saint's Day festival and an Anglo American patriotic ceremony. For an immigrant community fragmented by class, region, dialect, and personal and political rivalries, Columbus Day became a means of creating a pan-Italian identity. The annual parades and the once-in-a-lifetime drive to raise money to erect a Columbus statue became fixtures of Italian American communities.

Angelo Noce, a Ligurian who served as the Italian consul first in San Francisco and later in Denver, is credited with winning the first establishment of Columbus Day as an official holiday, in 1907 in Colorado. The long lists of sponsoring organizations typically inscribed on Columbus statues testifies to the tenuous character of the unity that the parades and statues achieved, but as Italian Americans prospered, and their leaders gained political and economic influence, Columbus Day became a national holiday, first

by presidential proclamation (1934), then by congressional action (1968; effective 1971), which changed the holiday from October 12 to the second Monday in October. The format of the observance—parades, speeches, banquets, and ceremonies focused on Columbus statues—remained the same, but with declining public participation or interest as the fifth Columbian centenary approached in 1992.

The quincentenary highlighted rival ethnic claims to Columbus Day. In New York, Puerto Ricans and other Hispanics had begun celebrating October 12, in common with the rest of Latin America, as *El Día de la Raza*. In 1988 Congress expanded “Hispanic Heritage Month,” traditionally anchored on the Mexican national holiday of September 15, into mid-October, taking in Columbus Day as a gesture to Hispanics of non-Mexican descent. No specific rituals were associated with the movement, although cities with large Hispanic populations, such as Miami and San Antonio, established festivals focused on October 12 and/or the federal holiday. In San Francisco, the traditional Columbus Day ceremonies expanded to take in Asian Americans, who had, in fact, come to outnumber Italian Americans in the traditionally “Italian” North Beach neighborhood. Noting the ethnic diversity of the occasion, the *San Francisco Chronicle* commented in 1984 that the Columbus Day parade in that city had become as “Italian as guacamole pizza.”

The most provocative challenge to the celebratory character of Columbus Day came from Native Americans, or from Whites claiming to speak for them. In 1976, for example, student protesters from Stanford University disrupted the mock landing of Columbus in San Francisco’s Aquatic Park, a ritual that dated back to the days when the “discoverer” would come ashore from an immigrant fishing boat. The fear of further disruption led the organizers of the mock landing to abandon the practice of having Whites dressed as Indians welcome Columbus, in favor of hiring Native Americans from California and later from Mexico to play this role. After demonstrators prevented the landing altogether in 1992, the ritual was abandoned. Native American protests in other cities have been characterized by inventive desecrations of Columbus statues or by counterparades that identify Columbus as the agent of enslavement and genocide.

It remains to be seen whether these new ethnic challenges will transform Columbus Day as fully as Italian Americans did a century ago. In 1993 San Francisco’s Columbus Day parade attracted little attention, notwithstanding that the day officially had become “*El Día de la Raza/Day of Concern for Indigenous People*.” Although some voices have been raised in favor of abandoning the holiday altogether, it seems more likely that the holiday will evolve in the direction of consumerism, not ethnicity. If one of the items consumed on Columbus Day is ethnic food, whether of Hispanic or Italian origin, that will serve merely to distinguish the holiday from other similar observances such as Labor Day, Memorial Day, or Presidents’ Day.

Combs, Josiah H. (1886–1960)

Professor of modern languages and folklorist with special interest in Appalachian dialect and folk music. Combs was born January 2, 1886, at Hazard, Perry County, Kentucky, and grew up in a large singing family in nearby Hindman in Knott County. In 1902, when Combs was sixteen years old, he attended the newly established Hindman Settlement School. The school's founder, Katherine Pettit, took an interest in local balladry, and she noted a number of songs from the young Combs. These were eventually forwarded to Harvard University scholar George Lyman Kittredge, who included them in an article in the *Journal of American Folklore* in 1907. Thus, Combs contributed indirectly to one of the earliest published collections of folksongs from the Southern Uplands.

In 1905 Combs entered Transylvania University in Lexington, Kentucky. His contact there with Dr. Hubert Shearin led to joint publication of *A Syllabus of Kentucky Folk-Songs* (1911). This was followed by *The Kentucky Highlanders from a Native Mountaineer's Viewpoint* (1913), and in 1915 Combs edited an anthology of Kentucky poetry.

From 1911 to 1918, Combs taught languages and literature at high schools and colleges in Kentucky, Tennessee, Virginia, and Oklahoma. He also found opportunities to perform Kentucky folk music for sophisticated city audiences, using an Appalachian-plucked dulcimer to accompany his lecture-recitals.

Military service in World War I took Combs to Czechoslovakia (1920–1921) after which he returned to the United States to teach French and Spanish at West Virginia University (1922–1924). He next studied at the Sorbonne in Paris, taking his Ph.D. *summa cum laude* in 1925 with a dissertation entitled *Folk-Songs du Midi des États-Unis*.

Combs has most often been associated with Kentucky folksong study, yet he was equally passionate about the study of language. His facility with Greek, Latin, French, Spanish, Italian, German, Old English, and Middle English was supplemented by an extensive knowledge of Old and Middle English literature. He was especially interested in showing connections between folk speech in America and earlier English forms, and he was an enthusiastic collector of locally created words and expressions.

Combs eventually settled in Forth Worth, Texas, to teach at Texas Christian University. Although he maintained his interests in folk music, languages, and literature, he was largely outside the ken of folklorists until Wilgus contacted him in the late 1950s. Unfortunately, Combs died suddenly on June 2, 1960, only a few days before Wilgus was to visit him to tape record the tunes of items in Combs' ballad collection. Subsequently, Wilgus edited a long overdue English translation of *Folk-Songs du Midi des États-Unis* (*Folk-Songs of the Southern United States*), which appeared in the American Folklore Society's Special Series in 1967.

Combs was an individual whose insights reflected both the immediacy of his family roots and the mediating distance of scholarly analysis. As Wilgus later pointed out, Combs tended to be both defensive and self-critical when discussing his native

Appalachian region. His scholarship reflected “sturdy common sense along with his intimate knowledge of...folk culture.”

Combs is buried at Fort Sam Houston National Cemetery in San Antonio, Texas, and his ballad collection is housed at Berea College in Kentucky as part of the papers of D.K. Wilgus.

Comparative Approach

The practice of comparing substantial numbers of cognate items of folklore to establish their similarities, differences, and probable course of development. Comparison has always been characteristic of folklore studies. Whether we consider the interest in foreign cultures that flourished during the Renaissance, the citation of parallel texts beginning with the Grimm brothers, the interest in cultural evolution championed by late-19th-century anthropologists, or the stemmatic model of the historic-geographic method to be the beginning of “modern” folklore scholarship, we find that more or less rigorous comparison has always been essential. Only through careful comparisons of superficially similar traditional forms can the relative contributions of replication and variation, or the likelihood of independent origins (polygenesis), be assessed. In addition, comparison of traditions in adjacent cultures can identify particular developments that have occurred in each culture or subculture.

Anthropologists have argued that, because comparison is essential to human thought, there is no single comparative approach (Lewis 1970; cf. Boas 1940:270–280). Folklore does not suffer from this ambiguity. Here, “comparative” is a technical term, borrowed from philology, as evidenced in such phrases as Antti Aarne’s title *Leitfaden der vergleichenden Märchenforschung* (Guide to Comparative Folktale Study, [1913]). Insofar as they are practicing the comparative method, folklorists restrict their comparisons to variants of a single tradition: Their purpose is to define that tradition.

The Historic-Geographic Method. The study of Indo-European linguistics began in 1786 when Sir William Jones established the relationship of Sanskrit to Greek and Latin. On the basis of the similarities among these languages, a parent language was inferred. The simplicity and objectivity of this approach made it seem both suitable and desirable for the reconstruction of early forms of oral traditions.

Intrigued by work of Elias Lönnrot, who “reconstructed” the Finnish epic *The Kalevala* from ballads and songs, Julius Krohn began, in the latter part of the 19th century, to codify procedures for reconstructing oral traditions based on philological principles: The variant texts should be analyzed to see how they led back to a single original text (in German, the *Urform*; in English, the “archetype”). At this time, scholars were arguing about the diffusion of traditional literary forms, including folktales: Some believed that it was primarily prehistorical, while others thought that most of it occurred during the Middle Ages. Julius’ son Kaarle Krohn set out to test the idea that European folktales came from India in historical times by reconstructing the original forms of individual tales and, at the same time, determining their original homes and their paths of migration. His method was called historic-geographic because early (literary) variants are arranged historically and later (oral) variants are grouped geographically, in order to achieve the reconstruction as objectively as possible. Ideally, the versions of the tale will fall into a stemmatic pattern—all of the later forms of the tale can be seen to have developed from the hypothetical original form. This stemmatic pattern is analogous to that used by philologists to reconstruct the Indo-European language.

This method works very well for traditions, like language, that change slowly or in regular patterns. It is most useful for folktales that are relatively stable, like “The Clever Peasant Girl” (AT 875), “The King and the Abbot” (AT 922), and “The Kind and Unkind Girls” (AT 480). For tales that are subject to more variation, the method is more difficult to use. The original form of the tale is less obvious, and may even be the subject of a debate. Kaarle Krohn’s *Übersicht über einige Resultate der Märchenforschung* (Survey of Some Results of Folktale Study) (1931) offers an alternative historical development for several tales. Nevertheless, the fact that scholars using the method assembled large numbers of variants and paid careful attention to their contents advanced the respectability of folklore studies as an academic discipline.

The American folklorist Stith Thompson contributed greatly to the success of the historic-geographic method. His *Motif Index* (1995) and his revisions of Aarne’s *The Types of the Folktale* (Aarne and Thompson 1964) helped considerably to make the large numbers of variants necessary for historicgeographic studies easily available. Since this classification began with European tales, and since the Americas are peripheral regions of European culture, folklorists studying American folktales have not taken full advantage of the possibilities the method offers. Yet, regardless of whether it is able to establish an archetype for a particular tale, the method often discovers features that are unique to particular regions. Thus, the tale “The Taming of the Shrew” (AT 901) has developed an American joke form (Brunvand 1991:213–228).

Two other genres to which the historic-geographic method has been applied successfully are the ballad and the riddle. Following Svend Grundtvig’s work on Danish ballads (*Danmarks gamle Folkeviser*, beginning in 1853), Francis James Child classified English ballads, adding notes that are useful even for tale studies. Neither of these scholars attempted the rigorous laying out of variants and careful reconstruction of the original text that Krohn advocated, but they did comment on the relationships among their texts, noting which were derived from which. Thus, these notes were the foundation of 20th-century historic-geographic ballad studies (Taylor 1927–1928). In addition to his many historic-geographic studies of folktales, Aarne wrote several historic-geographic studies of riddles, which are interesting because they identify regional characteristics.

The method depends on the scholar’s ability to find variants. Genres that have defied indexing, such as legend, where the texts are too variable, are difficult if not impossible to study in this way. In the case of simple material, such as folk beliefs and single narrative motifs, each item is too brief to permit conclusions about its history. Based as it is on the idea of texts being diffused from a single place of origin, generally by land routes through territory inhabited by settled populations, the method is not suitable for Old World traditions brought to America by immigrants from different countries. In this case, Old World ethnic origins, not the location in America, may be the appropriate criteria for the arrangement of variants. Nor is the method suitable for modern traditions that are carried by national or international media, or even in letters or telephone conversations; in such cases, geography is irrelevant to the development of the item.

The Comparative Approach in America. “While the American folklorists Thompson and Archer Taylor were prominent in the development of the indexes that are essential to the historic-geographic method, less-stringent comparative approaches have characterized the study of folklore in America. For example, annotators of folktales, such as Herbert Halpert and Leonard Roberts, in comparing American variants to their European

counterparts, have occasionally remarked on peculiarly American alterations to certain tales.

American ballads and proverbs have received more attention. For her comparative study of "The Maid Freed from the Gallows," Eleanor Long (1971) found that grouping the texts according to their verbal correspondences was more helpful than using their places of origin. Tristram Potter Coffin (1977) noticed that American ballads tend to be shorter and more lyrical than their British antecedents. They concentrate on the climax of the story and replace some of the supernatural motifs with rationalistic ones. Ballads composed in America have also been cataloged according to story types (Laws 1964), which has aroused some opposition from those who believe that indexing ballad themes would be more effective (Wilgus 1970). Since, for practical reasons, folklore indexes must be made before each entry can have been thoroughly studied, they often separate items that are, in fact, interconnected. While such lapses do not necessarily prevent the indexes from leading to the relevant material, they make them cumbersome and they are often considered defects.

Taylor was instrumental in advancing proverb scholarship to the point where comparative studies (both American and international) could be accomplished. American proverbs have been collected more thoroughly from literary sources than from oral ones. Comparative studies show that some become more stylized with time, evolving into forms with more pronounced poetic features such as rhythm, rhyme, and well-defined structure (Taylor 1975; Mieder 1987:157–228).

Taylor, in his *English Riddles from Oral Tradition* (1951), annotated English (including Anglo American) riddles with references not only from Europe but also from other parts of the world; however, subsequent studies of riddles have been more interested in their structures and functions than in their types and variations. Finding-lists of children's rhymes (Abrahams 1969; Abrahams and Rankin 1980) provide access to that material. In the case of superstitions, however, indexing has been frustrated by the variety of combinations of motifs. Many superstitions are spread rather evenly throughout the country rather than confined to particular regions.

In the realm of material culture, comparative research has managed to do well even in the absence of indexes. Comparisons of artifacts reveal cultural regions within the United States, sometimes showing how European forms were altered as they were adapted to the requirements and fashions of America (Glassie 1968).

For studies of oral tradition of preliterate cultures, a geographic arrangement of the material is often feasible. Franz Boas took such an approach to the study of Native American folklore. He was interested in the regions that such studies reveal and in the borrowing, lending, and adaptation of culture elements. Thompson (1965) followed up his early interest in Native American folktales by using the geographic pattern of one tale to determine its history, as a test case to prove that the historic-geographic method would indeed work even without old variants.

The comparative approach has been important in the study of the origins of African American folklore. Melville Jean Herskovits, following Boas' example, pursued what he called "the comparative study of cultures within a given historic stream" (Herskovits 1956:141), as opposed to the global comparative approach of earlier anthropologists such as Tylor and Frazer. Richard M. Dorson (1967) was able to cite European antecedents for many folktales told by African Americans. As more African folktales, and indexes to

folktales, have been published, many of those same tales can be seen to have African antecedents as well. If this situation makes it seem as though origins are wherever you look for them, that is not the fault of the comparative method, but rather of the imperfect state of folklore collection and classification.

In the 1920s and 1930s, the historic-geographic method was presented as *the* method of folklore scholarship (Krohn 1971). Its present advocates have come to believe that other approaches can supplement it to good effect. Beginning in the 1960s, it became unfashionable and was quickly overtaken by other methods. Several of these, however, including structuralism (in which a single pattern is found in several different items) and the oral-formulaic approach (in which type-scenes and story types replace motifs and tale types), are derived at least in part from folklore's comparative approach or from its antecedents or cognates in other disciplines such as linguistics and classics. Also at about the same time, many American folklorists became interested in genres of folklore that had not been indexed: They were too new (such as jokes and toasts) or too variable (such as legends). Since variants could not be located, comparative studies were impossible.

Even so, as long as folklore studies continue, the comparative approach will not become obsolete because tradition can not be defined without careful comparison. While the particular details of traditional items such as folktales and riddles are usually culture specific, more general features are often found in diverse cultures. Thus, the comparative approach is well suited to showing basic, common beliefs and traditions held jointly by people of many different cultures. With it, folklorists can explore both the unity and the diversity of mankind.

Computer Folklore

Folklore either about computers and those who use them, or folklore that circulates among those who use computers, especially by means of the technology or based upon specific features of the technology. Computer folklore is not yet well documented. Folklore about computers dates back to the late 1940s, with the exoteric perspective representing computers as more than human, sometimes literally divine, as this example illustrates:

IBM had just installed its newest computer at the Massachusetts Institute of Technology (MIT), and a number of campus notables gathered for its unveiling. Members of the group were requested to submit questions that they thought would test the huge machine. An astronomer submitted a question about the size of the universe, and a physicist asked the number of black holes in the universe. Both seemed satisfied with the answers given.

Finally, a philosopher asked the ultimate question: "Is there a God?" The computer operators fed this question to the computer, and after several minutes of computation, the computer printed out its answer: "There is now!"

A variant of the omniscient-computer joke begins the same way, but the third person's father had died recently, and so he asked where his father was. To this the computer did not answer "in heaven" or "in hell" as expected, but rather "in Wisconsin." When the third person provided the information that his father had died three days earlier, the computer's immediate reply was: "The man who married your mother died three days ago. Your father is fishing in Wisconsin." (The same joke, however, circulated many years ago about a fortune-telling scale.)

In the 1950s and early 1960s, early attempts at computer translation were hugely unsuccessful, presumably resulting in computer-translation projects? The computer translated "out such computer-as-idiot jokes as this: Did you hear about the of sight, out of mind" into "invisible idiot!"

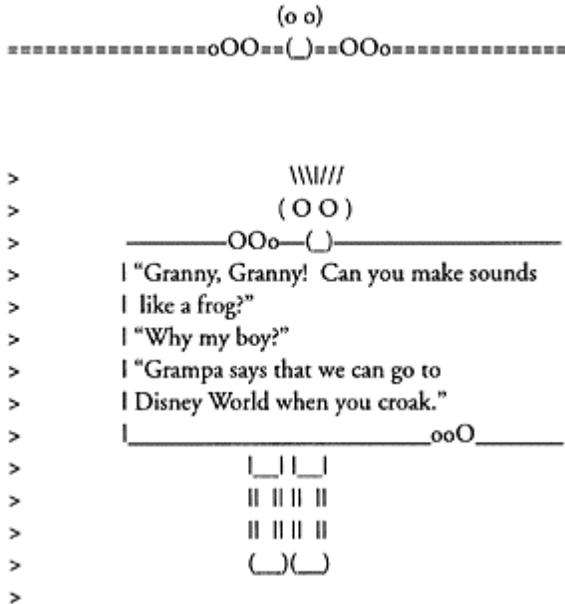

The exoteric view of computers remains bifurcated, with computers either supremely able or inhumanly stupid, demanding payment of debts of \$00.00 or converting change for an \$8.39 breakfast to \$83,900.00 Such accounts seem to be on the wane due to the improvement of the technology and the increase in the popular understanding of how computers operate.

Those who work with computers have an insider's perspective that does not tolerate apocryphal tales about the machines' capabilities. "Garbage in, garbage out" (or GIGO), rarely heard today, reflects insiders' shifting the onus for computer failure onto data-entry operators and, perhaps less commonly, onto programmers. Nonetheless, those inside the technology long told stories about larger-than-life exploits of individuals, whether, in the

era of mainframe computing, about individuals who had a cot at the local computing center so that they could work all night or, with the advent of interactive computing, about all-night “hacking.” These stories, which may be contrasted with the omniscient computer, were almost always accurate in technical details.

Nearly everyone knows the account of the founding of Apple Computer, and the later success of Microsoft’s Bill Gates is told, and reported in newspapers, with the same larger-than-life rhetoric of hero legends. Conversely, there is a traditional demonizing rhetoric—for example, about contemporary hackers who threaten national security—just as there was, and remains, a rhetoric about computer viruses and their authors.

One way of outlining a history of computer folklore is to consider the development of various aspects of the technology, because printers and other “output devices” have often been put to “folk” uses, much as office photocopy machines have been used to reproduce the traditional items called Xeroxlore or photocopylore. Especially in the 1960s and 1970s, the computer printouts that festooned the walls of many system analysts’ offices were, in their complexity, markers of technical expertise and, through their use of exotic devices such as color printers, markers of access to those devices. Less-expert programmers had to settle for simple nudes and comic characters, such as the ubiquitous representations of the cartoon dog Snoopy. Interest in traditional graphic images, even simple ones, continues. The accompanying “Kilroy” and “Granny” graphic come from the signature blocks of computer users’ electronic mail messages:

Indeed, even Xeroxlore is circulated widely on the Internet, the most accessible being texts that are easily represented by strings of alphanumeric. “The Complete Set of Blonde Jokes” (more than 400 jokes comprise the file) begins:

Q: What do you call a blonde with half a brain?

A: Gifted!

The following item, titled “WHY ASK WHY?” contains a lengthy series of seeming paradoxes and contradictions, beginning:

Why do you need a driver’s license to buy liquor when you can’t drink and drive?

Why isn’t phonetic spelled the way it sounds?

Why are there interstate highways in Hawaii?

But computer folklore is more than jokes, tales, and Xeroxlore adapted to a new medium. In the late 1970s, a computer game, “Adventure,” was developed as a project in artificial intelligence. It was quickly appropriated by experienced computer programmers across the country for their own recreational use. Other computer games proliferated, and eventually many of them, including “Adventure,” were commodified for popular consumption.

Computer “viruses” were developed in the context of artificial intelligence in the early 1970s at MIT and elsewhere. Innocent enough in an environment of stand-alone computers, these programs proved highly destructive on networked computers in the late 1980s and early 1990s.

Much computer folklore reveals the extent to which the transmitters of that folklore are elite computer users, with access to increasingly sophisticated technology. Considered over time, technical computer folklore has “trickled down,” with massive imitation of the original few programs. Computer folklore—whether traditional items such as chain letters or computer games and viruses—that is copied and communicated by this means poses many difficulties to the industry. Computer viruses, of course, may be understood as direct threats, but computer games and even chain letters may consume so much time and space that they are treated as similar threats to the efficient operating of computer networks. Like the “little moron” jokes that were so popular during World War II that they interfered with the wartime production at many factories, the popularity of computer folklore also results in its proscription in many workplaces.

Con Artist

A swindler who, with criminal intent, gains the trust of strangers, usually through an assumed identity and carefully staged charades. Con games often depend on the victim's belief that she or he stands to profit dishonestly by cheating the con artist or some third party; the third party is usually the con artist's partner—though the victim is unaware of the partnership. Related terms include "confidence game," "con man/woman," "confidence man/woman."

One classic confidence game still in regular use is the "pigeon drop," in which the "roper" (the partner who "ropes in" the victim) strikes up a casual acquaintance with the potential victim in a public place, such as a town square or a shopping mall. The "pigeon" (victim, also known as a "mark," "sucker," "apple") is led to discover a "lost" wallet with no identification but a great deal of money. The "inside man" (the second partner) appears and provides expert advice: The money will be legally theirs to split if it is not claimed in one month. In the meantime, they should leave it with a reputable lawyer (the roper names one), along with earnest money, a deposit equal to, say, 10 percent of the amount found. The roper and the pigeon both contribute their share, names and addresses are exchanged, and the roper and the inside man make off with the pigeon's deposit.

The term *confidence man* was coined in 1847 in a *New York Herald* article describing a man (later identified as Wm. Thompson) who would approach a stranger on the street and ask whether the latter had enough confidence to entrust Thompson with his watch. The victim, thinking Thompson was an acquaintance not at the moment recognized, would comply, and the confidence man would walk off laughing. The term quickly gained popularity, eventually spreading internationally, and by 1856 Herman Melville published a novel titled *The Confidence-Man: His Masquerade*. The con artist has since appeared in many guises in literature, on the stage, and in motion pictures.

Many scholars have argued that the con game not only originated in the United States, but that it is a peculiarly American phenomenon and that the con artist is an American folk hero—our version of Robin Hood. Con artists are often depicted as charming, fast-talking rogues preying only on unsavory characters who deserve to be fleeced. The immorality of the confidence man's actions is mitigated by his choice of victims and overshadowed by his personal charm and impressive capabilities, not the least of which is a keen insight into human nature.

Con artists may be seen as folk heroes because they embody some fundamentally American characteristics. Con artists depend on their ability to assume false identities, an ability enhanced by America's social and geographic mobility. Furthermore, their readiest victims are people who believe that the world is characterized by promise, that it is full of wealth to be had for the taking—people who believe in the possibility of getting something for (virtually) nothing. The great bounty of America helped foster this attitude, especially in the expansive years before the Civil War.

Like many criminal types, con artists comprise their own subculture, complete with traditions, values, and their own jargon. Some further terms for confidence games include

“the broads,” “the wire,” “the rag,” “the hype,” and “the tat.” Several terms describe props, strategies, and moves within a game: The “convincer” is money the mark is allowed to win before being swindled; a “cackle bladder” is a rubber bladder filled with fake blood (in early days with chicken blood, hence its name) and used to fool the mark into thinking one of the con artists has been killed; “to blow off” is to get the mark to leave the scene of the crime (the cackle bladder is often used to blow off the mark); and “to put the mark on the send” is to send him or her to get more money to lose to the con artists. A “short con” is any con game in which the mark is taken for only the amount of money he or she is carrying; a “big con” is any confidence game in which the mark is put on the send (see Maurer 1974).

The “sting” is the moment when the mark’s money is taken, and *to sting* is to take money from a pigeon. Popularized in the Academy Award-winning 1973 film *The Sting* starring Robert Redford and Paul Newman, the term has become widely used to describe covert and duplicitous operations by law-enforcement officials intended to catch criminals in the act of breaking the law. Thus, in an ironic twist, in so-called “sting operations,” police officers or FBI (Federal Bureau of Investigation) agents emulate con artists to capture criminals.

Conjunto Music

A folk-music tradition that emerged in south Texas in the late 1920s and moved into its popular culture form beginning in the late 1940s. Manuel Peña's *The Texas-Mexican Conjunto: History of a Working-Class Music* (1985) provides the definitive history of this musical form. The music's forms and instruments were brought into the region from the Matamoros, Mexico, area beginning in the late 19th century. Central to *conjunto* music is the accordion, which became the preferred instrument in working-class *tejano* music. It was readily available and relatively inexpensive, particularly the one-button models from Germany and Italy, which were available dutyfree in Reynosa.

Two basic types of music were popular at the time, music to listen to and music to dance to. Early *conjunto* music was popular at dances partly because it was instrumental rather than sung music, which was common in cantinas and in the *bailes de negocio* (dances where men paid their partners to dance, often women of the street), both of which carried a social stigma among the family-oriented *mexicanos*. Too, the *conjunto*—composed of the accordion, accompanied by a *tambora de rancho* (a folk instrument like a drum) or a handmade *bajo sexto* (a twelve-stringed instrument)—was affordable for those who wanted to hire musicians for a *baile decente* (decent dance), such as those held at weddings, anniversaries, and other such events. Early in the 1930s, the *bajo sexto* replaced the *tambora de rancho*. The common dance music included the polka, the schottische, the mazurcas, the *vals bajito* (redowa), and the *huapango*.

Like many folk traditions, *conjunto* music became a boundary marker between folk groups, in this case not only between Anglos and *tejanos*, but also between working-class *tejanos* and those in the middle or upper class, who preferred the music of the *orchestra tipica* (composed of mostly stringed instruments) or singing duets or trios accompanied by guitars.

Beginning in the late 1920s and early 1930s, recording companies began issuing *conjunto* music to sell to members of *la raza* not only in Texas but in California and the rest of the Southwest, as well as the areas where migrant workers had settled, like Detroit and Chicago. They also became popular performers on the Spanish-language radio stations throughout the Southwest and beyond. These performers were folk musicians who made their living working at various jobs and playing part-time. Their popularity and fame spread as a consequence of this exposure on radio and record.

The most important accordion players and shapers of the *conjunto* music of this era included Narcisco Martmez, Santiago "Flaco" Jimenez, Bruno Villarreal, Jose Rodriguez, and Lolo Cavazos, among others.

Beginning in the later 1940s, *conjunto* music evolved from a folk into a popular musical form. It remained one of the most popular music forms among the working-class Mexican Americans in Texas and beyond. The electric bass replaced the *bajo sexto*, and drums were added. Eventually, some groups replaced the accordion with the new electronic keyboard. *Conjunto* music continues to be popular among working-class Mexican Americans.

Conroy, Jack (1898–1990)

Novelist, storyteller, editor, industrial-folklore collector. Born in a coal-mining camp near Moberly, Missouri, Conroy grew up in a work community called Monkey Nest, where orality and the customs of immigrant miners (Irish, British, Italian) meshed with labor-union activism. Shortly before World War I, “Monkey Nest” vanished, victim of a new industrial order and cheaper sources of energy. It appeared that the folk culture of preindustrial communities might vanish, too, in the tide of proletarianization, but Conroy observed that this culture took new forms in factories, shops, and mills. Apprenticing in the Wabash Railroad shops, Conroy practiced his writing skills as secretary of the union local. After the defeat of the 1922 Great Railroad Strike, Conroy worked in auto factories and steel mills until 1930 when the Great Depression cast millions of workers loose to survive as best they could. Drawing upon the transformed folk culture of industrialized workplaces and his own experiences, Conroy wrote sketches and short stories for magazines such as the *American Mercury*, encouraged by editors H.L. Mencken and Mike Gold (*New Masses*). Skilled at transforming folk narrative into literary sketches, Conroy received acclaim from both conservative and radical critics in the early 1930s.

Founding editor of the *Anvil*, which published Erskine Caldwell, Nelson Algren, Meridel Le Sueur, and Richard Wright, Conroy later joined the Illinois Writers’ Project in Chicago, where he participated in conceptualizing and collecting industrial folklore. Drawing from this work, Conroy and the Black novelist Arna Bontemps wrote a number of very successful children’s stories. They received the James L. Dow Award for their collaborative work on Black social history, which drew in part from Conroy’s earlier research as a Guggenheim Fellow. Among his honors were an NEA (National Endowment for the Arts) artist’s grant; an honorary doctorate from the University of Missouri, Kansas City; and the Literary Times Award from the state of Illinois.

The populist-radical impulses that animate Conroy’s novels, folk narratives, and sketches express the grief, joy, and dignity of working-class people, translated into new factory settings. Humanitarian conviction and generosity of spirit illuminate the work of this remarkable man.

Conspiracy Theories

Notions of history and society holding that certain unexplained events, as well as human suffering and powerlessness, result from the machinations of secretive groups whose surreptitious aim is to wield power through deceit and violence.

The attempt to expose and combat ostensible conspiracies is a particularly American pastime. In fact, the United States is the only Western nation in which conspiracy to commit a crime is prosecutable as a crime in and of itself. This infatuation with conspiratorial activity articulates the American values of democratic openness and antielitism.

Some schools of conspiracy theory address a single event, such as the deaths of Abraham Lincoln, John F. Kennedy, or Marilyn Monroe. Others do not settle for identifying trivial cabals, but propose the existence of worldwide networks that form the center of a conspiratorial worldview that allows its adherents to make sense of the whole world and all of its events in a manner not unlike a religious belief system. Indeed, conspiratorialism and religious belief are often inexorably intertwined. The devil is often regarded as the source of all conspiracy, and God is the protector of those conspired against.

America's first great conspiracy concern involved this sort of religious dimension. The Puritans regarded the pope in Rome as the biblically prophesied anti-Christ who would aspire to world domination in the last days—an idea that would never leave some segments of American folk consciousness. Since colonial America had few Catholics, Puritan anti-Catholicism found few tangible targets. In the 1820s, when William Morgan was allegedly murdered by Freemasons for exposing their secret rites, anti-Masonry became so popular that it formed the basis for an influential political party. Later in the 19th century, as hundreds of thousands fled Ireland and eastern and southern Europe for the United States, anti-Catholicism reemerged reinvigorated by the presence of living, breathing Catholics. Nativist politicians decried Catholic allegiance to the Vatican as treasonous, and lurid tales of the diabolical deeds of monks and nuns saturated the popular press. As the 20th century began, Communism (often associated with eastern European immigration) began to emerge as the main conspiratorial threat to American culture.

During the second Red Scare of the 1950s, the John Birch Society—whose name is almost synonymous with conspiracy theory-ism—regarded U.S. Senator Joseph McCarthy (ironically, a Catholic) of Wisconsin as a folk hero. Curiously, despite its vehement anti-Communism, the John Birch Society identified the same groups that leftists identified (and continue to identify) as the key players in the worldwide conspiracy game—the United Nations, the World Bank, the International Monetary Fund, and big-money capitalists.

Conservative Protestants—long the instigators of conspiracy accusations—found themselves in the late 20th century on the receiving end of conspiratorial accusations as they mounted campaigns to influence local and national politics.

Today, Americans can pick from a smorgasbord of paranoias. None of the traditional conspirators ever really disappeared; they just faded into the background as new ones more resonant with modern concerns emerged.

Conspiracy theories can be seen as “folk social science” and “folk history” that attempt to accomplish the same goals as their mainstream academic counterparts—providing meaningful and accurate explanations for conditions in the world. Conspiracy theories do this outside respected forums and styles of discussions and through such folkloric media as the fringe press and oral transmission.

Conspiracy theory-ism is a thriving industry whose various manifestations support numerous bookstores, magazines, and symposiums. Conspiracy theorists form communities of “true disbelievers”—subcultures of intellectual dissent from official, mainstream cultural analysis.

The great irony of conspiracy theory-ism in America is that it is often those groups most caught up in exposing the conspiracies of others that themselves behave in the most conspiratorial manner. Anti-Masons would meet in secret groups to denounce the secrecy of Freemasonry and conspire to destroy its adherents. The fleetingly influential nativist “Know Nothing” political party got its name from the fact that it began as a secret society whose members would disclaim any knowledge of the organization. The Ku Klux Klan has long been warning against conspiracies to strip “real” Americans of their constitutional freedoms, while at the same time conspiring behind white sheets and secret meetings to deprive African Americans, Jews, and Catholics of their civil rights.

Contextual Approach

Refers to the general and the specific background of a composition or a structure and, in the verbal arts, also to the parts preceding and following a given section. The term “context” is from the Latin *contextus*, stem of *contexere*, meaning to “weave together.” William R. Bascom has proposed that any functional analysis requires an adequate description of the social context of folklore, including the time and place for the telling of specific forms; the identity of the narrators and the composition of the audience, as well as the relationship of the narrator to the text; the use of dramatic and rhetorical devices in performance; audience participation; folk classification of traditional genres and the people’s attitudes toward them (Bascom 1954). Since speakers understand their folklore through the knowledge of these details, any interpretation of a tale, a song, a proverb, a riddle, or any other genre of folklore must account for them as well. The meaning of a text, a melody, or a design is its meaning in context.

The deliberate shift, or the accidental transference, of any folklore text to a different literary, historical, or cultural context grants it a new meaning. When a composer employs a folk tune or an author refers to, rewrites, or even reproduces verbatim a folktale, they bestow upon them new meanings, of which, their being considered traditional expressions is a part. When a tale that has a worldwide distribution becomes a part of the repertoire of one more society, its members interpret it in terms of their own

culture, history, religion, and worldview, and when immigrants use their folklore in their new country they convey in their telling and singing their longing for their homeland—a meaning these tales and melodies do not have in their country of origin.

Of all folklore methods, the contextual approach is most specifically a challenge to the comparative approach. It seeks to interpret folk ideas, customs, tales, and songs not in terms of their similarities to the forms and subjects of folklore of other nations, but in their integration with the life, thought, language, and actions of the people that perform, observe, and act upon them in their own society and time. A valid interpretation is, therefore, an interpretation of a text in context.

Contrary to the views of some scholars, the contextual approach does not assume that there is an opposition between text and context. Rather, its basic supposition is that folklore exists in a contextual state. Therefore, some scholars prefer to treat the entire context as if it were a literary text. Each situation is a unique integrated whole. While no two contexts are alike in speaking or singing, people follow cultural rules and social patterns that are discoverable and that reveal the dynamics and the poetics of folklore in society.

Folklore forms differ in their dependency upon their context for their interpretation. The briefer the form and the more stable its text is, the higher is its contextual dependency; conversely, the longer and consequently the more variable a text is, the lower its contextual dependency appears to be. The meaning of proverbs, for example, is highly context-dependent, whereas tales, even epics, that have a wider range for textual variations retain stability of meaning in a variety of contexts. Such an observation applies mostly to the immediate context of performance, but not to the context of culture at large, the influence of which is very pervasive.

Proverbs are quotations from tradition. Their speakers intend to resolve an immediate social conflict by summoning into the situation the authority of the past. Their use, therefore, is prevalent in situations of traditional litigation, informal mediation, and pedagogical conversation. By their very use, these speakers claim authority. Riddles, on the other hand, contrast with proverbs in form and context. Their users are mostly children and youth rather than the elderly. They instruct but without morals. When adults pose them, they do so in situations of entertainment or even rites of passage rather than social conflict. In African societies, riddles serve to instruct pubescent initiates, while in earlier European and Asian cultures they were part of courting behavior and wedding ceremonies. Riddles often invoke humor rather than judgment, play and fantasy rather than ethical values, as proverbs do.

Among the narrative genres, ballad singing has been seen in the context of entertainment. In 18th- and 19th-century Scotland, farmhands performed ballads during work and in leisure and festive times. Literature attests to ballad singing on the streets and in the marketplaces in the urban centers of England even earlier, and, together with recitation, ballads have been the main staple of male pub singing. Their broad range of textual variations appears to be performer- rather than context-dependent.

Contextual analysis of folktales has focused upon the roles of narrators, either itinerant or resident, their repertoire, the telling events, the narration of specific genres, the social interaction in narrating situations, and the poetics of performed tales. A contextual approach to storytelling reveals a correlation between audiences, locations, and subject matters. People are more likely to tell competitive stories in the workplace and in all-

male gatherings; whereas the place of tales about existing or attained family harmony is around the hearth.

A common methodological error in the analysis of the context of folklore involves its treatment as if it were another item to be collected. With full realization of its significance, students would set out “to collect context.” However, unlike the texts of folklore genres, context is not a collectible. It may be observable, or at least partially so, and therefore should be carefully recorded, but in and of itself it is not as tangible as a text or a picture is. The information about the context of folklore performance has to be integrated with the verbal, visual, or musical communication of folklore in order to offer an adequate basis for the interpretation of an event.

Bronislaw Malinowski, the anthropologist who was among the first to draw attention to the importance of context in the understanding of language and folklore, distinguished between *context of culture* and *context of situation* (Malinowski [1923] 1946). The context of culture is the broadest framework for the perception and interpretation of folklore. It comprises the knowledge shared by the speakers, their conventional behavior and ethical principles, their history, their beliefs, and their speech metaphors and genres. In contrast, the situation is the narrowest, most direct, context for folklore performance and, therefore, a key for its interpretation. It comprises a speaker, a musician, or a designer (sender), a message in the appropriate medium, and a listener or viewer (a receiver). While at first glance this model for a context of situation may appear a simplistic truism, its significance becomes apparent by pointing out that any understanding of folklore can be achieved only through the analysis of the relationship between the sender, the message, and the receiver. The deciphering of the intricate relations and nuanced attitudes, past experiences, mutual perceptions, and purposes of speaking is the key for its interpretation. It elucidates the use and the significance of a particular fable, story, proverb, melody, or design, as they occur in social interaction in a particular time and place. The context of situation is an interactive arena in which the speakers’ age, status, and gender gain symbolic significance in their communication. Similarly, the code, style, and measure, the intonation and dramatization, the genre and its conventions, the time and place of performance, and the gender of the performer convey meanings. In the totality of the situation, the different components interact upon one another, having the capacity to redefine and renegotiate constantly the framework for communication. Within the context of situation, there is a correlation between the semantic values of the various components. For example, old age implies authority and traditionality and is appropriate for the speaking of proverbs, but not for riddling, which challenges the established order and for which youth is more suitable. In an interactive context of situation, age itself and, for that matter, other parts are negotiable.

Methodologically, the study of a context of situation may present researchers with an apparently insurmountable problem: The very presence of a folklorist in such a context changes the composition of the group. The sender may address his message as much to the folklorist, the outside observer, as to the addressees. As a solution to this dilemma, Kenneth S. Goldstein proposed the situational construction of an “induced natural context,” in which the researcher arranges for the exchange of folklore forms in their conventional circumstances in the society “as if” it occurs naturally, and then stays in the background and observes (Goldstein 1964). Such a staging of events may succeed on some occasions and fail on others. The folklorist’s dilemma points to the most important

change that the focus on context introduced into folklore research. This is a shift from collecting forays into different countries, the countryside, or even a specific ethnic group in an urban setting and toward prolonged fieldwork. Although even fieldwork of a long duration may involve similar questions, the requirement for a sustained presence in a society exposes the researcher to a broad range of social situations in which folklore forms occur in the life of the community.

Context is a value-free concept, and no one contextual situation is privileged over any other. Therefore, any situation constitutes its own context, regardless of its approximation to any imagined or authentic researcher-free performance. The presence of a folklorist in a recording situation adds to its meaning as well. Any narrator or singer can use the folklorist to enhance his position in the community or to present him with the traditions with which he and his community identify.

The contexts in which people perform folklore forms in their own society are *events*. An event is a culturally defined context to which a community allocates forms of discourse and which have known rules and conventions for folklore performance. It is possible to violate the rules of an event, but not those of a context. No utterance can be out of context because any new situation has its own context within or outside the cultural system of communication. Furthermore, if such a violation is deliberate and meaningful, it implies a higher degree of context dependency, because the performance acquires its significance from being counter to traditional conventions and rules. The performance of folklore forms can be within their culturally defined events or outside their boundaries, but they can never be out of context.

Corridos

Mexican American folk ballads popular throughout the Southwest from the 1830s to the 1930s. Passed from singer to singer, most folk *corridos* are anonymous, telling a story considered important to the local people. *Corrido* conventions include the formal opening and the *despedida*, or formal close, and the sixteen-syllable-line quatrain rhyming *abcb*. The central focus is to tell a good story, and specific facts are not too important. The story jumps from scene to scene, drawing on imagery from the *vaquero* life, from horse racing, and from cockfighting. The language is simple and direct, in contrast to the pseudoliterary language of the broadside ballad (*corrido* written and sold on the streets of larger cities in Mexico), often borrowing such terms from English as *cherife* (sheriff) and *rinche* (meaning law-enforcement officer, particularly the Texas Ranger).

The themes of the early *corridos* included fights with Indians, *vaquero* experiences, and various tragedies of importance to the local people. In Texas the border conflict beginning in 1836 and continuing into the 1930s was the focus of many *corridos*. Such border heroes as Juan Nepomuceno Cortina, Catarino Garza, Jacinto Trevino, and others were important because of their standing up to the Anglos (usually law-enforcement officers). Gregorio Cortez emerged as the idealized Mexican American folk hero, a border man who stood up for his rights against the Anglo law-enforcement officers, "with his pistol in his hand."

The ancestors of the *corrido* include the Spanish *romance*, a narrative ballad form brought into the Southwest by the first Spanish settlers and colonists in California, Arizona, New Mexico, southern Colorado, and Texas. The *verso* or *copla* (a short, lyrical stanza) was cultivated in some areas prior to the rise of the *corrido*. The *décima* (a ten-line stanza) of oral tradition, found in the American Southwest as well as Mexico, also came with the early Spanish settlers and would compete with the *corrido* in the 19th century. The *corrido* century in Texas (1836 to the 1930s) corresponds to the period of serious border conflict, and many compositions dealt with the struggle to establish the Republic of the Rio Grande and with the guerilla warfare against Zachary Taylor's troops.

One of the earliest border *corridos* in its complete form is the "Corrido de Kiansas," dating to the late 1860s or early 1870s, which tells of the experiences of *vaqueros* on a trail drive to Kansas in this period. Fifty years later, this *corrido* would serve as a model for the "Corrido de la Pensilvania," in which the men involved were not *vaqueros* but rather builders of railroads.

Beginning in the 1850s, the *corrido* form emerged in Greater Mexico, replacing the *décima* as the most important ballad form. A number of these were brought into the American Southwest. The dominant themes included personal or family relationships, love tragedy, and filial disobedience, as is found in "El Hijo Disobediente."

In the late 1920s in Texas, record companies began making 78-rpm records of many of these folk *corridos*, and the *corrido* slowly moved from a folk-music form to a popularculture form, in which the text does not go through the process of being passed

from singer to singer and being shaped to the cultural ideals and values of the community. The *corridos* recorded after the assassination of President John F. Kennedy, for example, were similar in many ways to the earlier broadside *corridos* in the Southwest. *Corridos* continue to be a significant form in popular music. On ranches and in many small communities along the Rio Grande, one can still hear the old folk *corridos* as well, indicating that the tradition continues.

Cortez, Gregorio (1875–1916)

Legendary Mexican American folk hero during an era of violence against Mexican Americans in south Texas in the early 20th century. While his popularity was greatest during the first three decades of the century, many older Mexican Americans in the region, particularly those on south Texas ranches, continue to hold him in high regard.

Cortez was born on a ranch just south of the Rio Grande on June 22, 1875. His family crossed into Texas and moved to the Austin area in 1887. For several years, he and his older brother, Romaldo, worked together on farms in Karnes and Gonzalez counties. In 1900 they rented land to farm for themselves.

Gregorio Cortez became a folk hero as a consequence of his standing up for his rights, “with his pistol in his hand,” against the Karnes County sheriff and two deputies who had come to arrest him for horse thievery, of which he was not guilty. Mexican Americans of this period were not given the due process of law accorded Anglos. They were often shot or beaten and arrested with little or no chance of consequences. Unaware that Gregorio Cortez was carrying a pistol, the sheriff pulled his pistol and shot Cortez’s brother, Romaldo, seriously wounding him. He also shot at Gregorio, but missed, and Gregorio shot him three times.

During the following chase, several hundred men in a number of posses pursued Gregorio, who walked more than 120 miles and rode three mares more than 400 miles. He was surrounded on occasion, but escaped. After ten days and a number of heroic efforts, Gregorio was betrayed by one of his own kind and captured by a Texas Ranger. He was returned to San Antonio, Texas, where he was placed in prison to await trial. During this period of the chase, more than 200 Mexican Americans were killed, many as part of a fictional “Cortez gang.”

Cortez was tried and found guilty three times, but the Texas Court of Criminal Appeals overturned the convictions. Then he was convicted for killing Sheriff Glover and sentenced to life in prison. He entered the Huntsville Penitentiary on January 1, 1905, and was paroled by the governor of Texas on July 7, 1913. He died of an apparent heart attack in 1916.

During the chase and the trial, Gregorio Cortez’s name was in the newspapers on a regular basis, often in stories revealing the typical Anglo prejudices against Mexican Americans of this period. The response among the Mexican Americans was the opposite—Gregorio Cortez became a hero. With his pistol in his hand, he had stood up to the Anglos and their mistreatment of Mexican Americans, and in essence he had defeated them. Through his skill as a horseman and his skill with weapons, he had outsmarted hundreds of law-enforcement officers until he was betrayed by El Teco, one of his “friends.”

Many legends grew around Gregorio Cortez and his heroic acts, and both broadside ballads and true folk ballads (both called *corridos*) about him were composed and sung during the next forty or so years.

Costume, Folk

Any manner of stylizing, marking, or manipulating the appearance of the human body with culturally understood symbols and forms in a way that articulates an individual's identification with a community. Folk costume usually refers to the dress of ethnic groups, subcultures, or other small groups, but it also can characterize the adornment practices common in any locality. The term "costume" includes not only clothing, but also other body adornment practices such as jewelry, cosmetics, hairstyling, masking, tattooing, and scarification, and can refer to everyday adornment as well as dramatic, ritual, or festival costuming. Themes in American folk-costume study include the outward articulation of identity through costume by diverse cultural groups, the interaction and creolization of costume forms in New World contexts, and the pluralistic legacy of such encounters in contemporary costume styles.

Folklorists who discuss adornment have concentrated on costume's socializing force and its relationship to the maintenance of individual and group identities. According to Don Yoder (1972), folk costume expresses identity in a symbolic way; functioning as an outward "badge" of community identity and expressing an individual's manifold relationships to and within that community. In many 19th-century religious sects, such as the Amish, Mennonites, and Shakers, fashion is rejected in plain-dress articulated group separation from mainstream society by embodying the principles of sectarian doctrine and enacting a "hedge" against the temptations of the

world. Thus, folk costume promotes group solidarity and maintains personal and group boundaries as individuals embody a community by reshaping their bodies in keeping with group values.

American society has been characterized by a plethora of traditions of dissent or differentiation articulated through costume and bodily adornment. In what Elizabeth Wilson has termed "oppositional dress" (Wilson 1985), the body is transformed into a site of struggle by disaffected subcultures as they attempt to define themselves as a social body by redefining the appearance and meaning of their physical bodies. The costume aesthetic of such groups is often formed through processes of appropriation or the manipulation of normative costume forms in a new, or nonnormative, fashion. Nineteenth-century feminists seeking equality, for example, clothed their demands in

masculine attire, advocating dress reform and appropriating men's-style jackets and ties for women's professional costume. Twentieth-century youth subcultures appropriate normative or fashionable costume signs and reassemble them within the terms of an alternative aesthetic. During World War II, African American and Latino youths articulated their discontent by adopting an exaggerated form of men's suits known as the zoot suit. This suit, characterized by its brightly colored fabric, drape jacket, wide pleated trousers, and prominent accessories, defied wartime rationing and engendered clashes with American servicemen. The suit was clearly at issue as a symbol of minority self-definition disenfranchised from patriotic, mainstream America.

Oppositional dress has also characterized postwar sub cultures. During the 1960s, countercultural hippies confounded gender distinctions (in long hair and untidiness) and appropriated both working-class clothing (such as denim Levis) and "sacred" American symbols (such as the flag) in clothing that functioned as a form of protest against conventional norms and values. This same tendency toward adornment as protest is present in the practices of contemporary punks and anarchists, who refuse mainstream consumption by wearing secondhand clothing reassembled with images of transgression and violence (rips, crosses, and multiple body piercings). In all of these cases, subcultures define themselves in part through costume by appropriating recognizable symbols and reworking their meanings within the terms of an alternative aesthetic. The juxtaposition of seemingly conflicting meanings in dress highlights and articulates the larger social conflicts addressed by such groups.

In local and regional New World settings, costume, like other aspects of material folklife, bears the signs of historical contacts, struggles, and exchanges between different cultures' understandings about adornment and the body. The design and meaning of new creolized vernacular forms emergent from the localized confluence of different traditions are particularly relevant issues for the study of American folk costume. Many specifically American types of costume emerged from the interaction of diverse costume traditions in dialogue with indigenous materials and environments. Recognizable forms in Western regional costume, for example, are creolized forms resulting from the interaction of different traditions of dress. The costume of mountain men who charted new Western territory—fringed buckskin coats, breeches and shirts, fur "coonskin" hats, and thick, colorful blanket jackets—was an adaptation of Native American costume forms suitable for native environments and constructed with indigenous materials. The occupational costume of the American cowboy was also the result of the interaction of various cultural forms in dialogue with the demands of occupation and environment. Many of the recognizable elements of the classic American cowboy costume, such as spurs, hat, boots, and chaps, were the result of cultural exchanges between working Anglo and Mexican cowboys, known as *vaqueros*. *Vaqueros* were known by their wide-brimmed hats, short jackets, colorful neckerchiefs, red sashes, elaborate spurs, and protective leather leggings, known as *chaparreras* (flared leather trousers with side buttons) and *armas* (wide leather coverings that lay across a rider's lap and legs). Texas cowboys adopted and adapted neckerchiefs, wide-brimmed hats and an abbreviated form of *armas*, or *armitas*, which became known as chaps and are still closely identified with American cowboys. These Western frontier costumes illustrate both a deep connection between the appearance of individuals and their identities as types on the American social landscape, as well as the dynamism typical of New World costume forms and cultural environments.

The cultural effects of enslavement and the forced migration of African peoples to the New World also engendered new creolized forms of bodily style and practice emergent from the collision and renegotiation of different cultural notions about

the body in African and European cultures. For example, new forms of African American hairstyling emerged involving African techniques of braiding in distinctly American styles as well as a variety of new forms constructed through straightening, waving, and recurling techniques, such as the “conk.” Kobena Mercer refers to these styles as “ethnic signifiers” that reflect African understandings about hair while creating new styles not present in African cultures, styles specific to the concerns and complex cultural heritage of African Americans (Mercer 1987). Such creole forms are invariably politicized in the context of historical displacement, inequality, and cultural hierarchy.

Although Americans celebrate few costume-centered holidays, costumes play an important role in several American festive occasions. Many American ethnic groups dress in folk costumes to observe holidays, and ethnic costuming also plays an important role in the performance of ethnic identity during folk festivals and folk-art performances for outsiders. The folk costumes of eastern and central European ethnic groups are often codified versions of past peasant festival styles from the culture of origin. Dance

performances and parades, in particular, are important occasions for sporting ethnic costume.

Unlike ethnic-festival costuming, which aims to make social identity clear and recognizable, other festival costumes center on the confusion or distortion of identity and the taking on of new, fictional, or performative roles. During Halloween, for example, children invert social distinctions by playing adult roles and taking on the identities of role models or fantasy figures. In addition, the boundaries between the human and the supernatural worlds are broken in costumes that represent spirit figures such as ghosts, witches, and figures of horror and in mischievous behavior such as pranks and housebreaking. In carnival contexts, such as Mardi Gras, a key feature of costumes is their excess. Elaborate and expensive, these carnival costumes exaggerate and distort the features and proportions of the body and extend its boundaries. This exaggeration and excess contribute to the sense of spectacle and a carnivalesque celebration of the excesses of the body and its pleasures. Masquerade and cross-dressing are major mediums for inversion and other renegotiations of social boundaries, common at such times when individuals try on new roles or identities, and the barriers between individuals are broken down during a period of license and transgression.

Folklorists studying costume traditions in any community need to discern what identities are being produced, maintained, or contested through costume forms, as well as the multiple cultural influences that shape costume forms in any locality. They need to understand how individuals appropriate new ideas from fashion of other cultural groups and integrate them into their wardrobes within the terms of a specific local, regional, or cultural aesthetic (including cut, color, accessory, or rules of assemblage). In addition, costume study is increasingly linked to the study of bodylore, and folklorists need to tease out the subtle bodily understandings of any given cultural group and see costume as an integral part of the everyday, habitual practices through which the body—its appearance, sensations, and boundaries—is managed and understood in any culture. In this context, costume must be understood in relation to other aspects of a culture, such as food consumption, healing practices, deportment, gesture, and speech—all practices that stylize the body, associate it with cultural attributes, and convey the substances of diverse American identities.

Country Music

A commercial music form and business with roots in vernacular music, popular music of the 19th and early 20th centuries, and religious music. Vernacular music had been popular throughout the rural United States from the earliest days of the country, and some of this regional material was captured on phonograph records as early as 1922. By 1923 record companies began to send talent scouts through the South to search out regional musicians whose music would have a special appeal within their own part of the country. The result led to “race records,” appealing to a regional Black audience, and “hillbilly” music, designed to appeal to a regional White audience.

In the early days of recording rural White vernacular music, traditional songs, ballads, instrumentals, and religious material provided a large percentage of the repertoire. As the artists exhausted this material, they began to compose new material in the mold of the old. The shift in styles was gradual and for years reflected the musical styles the musicians had known from childhood. Innovation came partly from normal musical growth and change, partly as a result of the pressure a commercial music industry imposed on the artists. On the earliest commercial disks, before the advent of electrical recordings in 1926, the emphasis was on string-band music from the Southeast part of the country. A few Western artists were captured on wax, but few recordings were made west of Dallas in these early years.

New York had long been the center of the popular-music business as well as the recording industry. Talent scouts fanned out from there. Despite the early emphasis on rural recording acts, the first huge country hit was by a classically trained tenor from Texas with the stage name of Vernon Dalhart. His 1924 release of “The Prisoner’s Song” and “The Wreck of the Old ‘97” became an instant million-selling record and ushered in an era of commercial disaster ballads. While Dalhart and others working in the same style performed such topical ballads, many of the songs actually were written by Southern songwriters who had learned how to fashion these ballads after a traditional model. Some of these songs entered into tradition. In subsequent years, folklorists who knew nothing of their commercial origins collected these songs.

In 1927 a field expedition to Bristol, on the Tennessee-Virginia line, yielded two of the most important early artists: Jimmie Rodgers and the Carter Family. The success and influence of these artists lasted for years and continues today. Rodgers and the Carters both extended the influence of African American musical songs and styles into country music. The Carters additionally established harmonies and rhythm that had a marked influence on later bluegrass music. A generation of singers, including Hank Snow, Ernest Tubb, and Gene Autry, began their careers as Rodgers imitators.

In the years following the stock market crash of 1929 and the ensuing Depression, the record industry shrank to a fraction of what it had been in its peak year of 1929. By 1935, when the industry began its recovery, it had a different flavor. No longer were traditional musicians providing the mainstay of the stable of artists, and no longer were traditional songs providing the bulk of the repertoire. Rather, a fully commercial product evolved

out of the roots that had taken hold a decade earlier. New musical forms were developing. Western artists emerged, and a new musical form known as Western Swing took shape. Artists like Milton Brown and, later, Bob Wills defined this new musical style that reflected a strong influence of both jazz and the blues superimposed on Texas fiddle music. Recordings were still coming from temporary recording studios set up in major centers, including Dallas and Atlanta.

During the mid- and late 1930s, the Western film emerged as a major genre. The Western, perhaps defining the mythology of the United States, became a powerful influence in both music and film. Singing cowboys like Gene Autry and Roy Rogers, as well as others who followed their lead, took center stage. These artists, on film and recordings, spawned a large repertoire of songs that imitated or mirrored music sung on the cattle range. Los Angeles began to develop as a recording center, and new Western artists like the Sons of the Pioneers gained exposure on both film and records.

World War II produced a number of changes in the country-music market. As soldiers from all parts of the country mingled, musical preferences merged and tastes moved into a more nearly national market. Furthermore, this period saw the rapid movement from rural to urban life. After the war, urban centers began to emerge as major markets for what had been previously seen as a rural commodity. The merging of Eastern and Western musical markets and styles gave birth to the hyphenated country-western music label. The cross fertilization was all-encompassing. Western wear, borrowed from the movies, became the preferred style of dress even for Southeastern singers. Nearly the whole country-music industry embraced the cowboy image as Southeastern musicians tried to discard the hillbilly stereotype.

Nashville, Tennessee, was originally one of many regional music centers, but certainly not the most important one. Cincinnati, Atlanta, Chicago, Richmond, Dallas, and Los Angeles were equally important as markets that shaped the development of country music. The Grand Ole Opry, begun in Nashville in 1925, was one of many influential radio barn dances. Although not the first such show, in time it emerged as the most important of these shows and was carried live throughout the nation on the NBC network. After the end of World War II, Nashville began to emerge as a recording center as stars of the Opry provided a focus for recording activity. Gradually, Nashville attracted the supporting industry of music publishers, professional songwriters working in the country vein, and artists hoping to gain a foothold in the business.

While the older string bands of the 1920s and 1930s were largely things of the past, they left their influence in a number of ways. The country musicians of the 1940s and 1950s often featured fiddles and guitars. But the emphasis had changed from a band that often included vocals to a lead singer with a backup band. Outstanding artists like Roy Acuff and, later, Hank Williams utilized these instruments and typified this trend. Many of the bands from this period also included an electric steel guitar. While this instrument had its origin as a Hawaiian steel guitar, the addition of an amplifier and electric pickup better suited many bands that made personal appearances in rowdy honky tonk bars. Microphones and amplification inevitably changed the character of country music. The electric steel guitar bridged both Western and Eastern music. The Dobro, an unamplified instrument, descended from the Hawaiian steel guitar. It was featured as a centerpiece of Roy Acuff's band.

The Dobro also found its way into some bluegrass bands, especially that of Lester Flatt and Earl Scruggs. While Nashville moved further and further from the traditional roots of old-time string bands, Bill Monroe began to experiment in the early 1940s with a musical form descended from these bands. This style of country music became known as bluegrass, named after Bill Monroe's home state of Kentucky and his 1940 band called the Blue Grass Boys. While bluegrass has generally not been as popular as more commercial brands of country music, in many ways it has been the one branch of country music in which traditional songs and instrumentals have survived. Bluegrass music seldom utilizes amplified instruments and stresses close harmonies.

In the mid-1950s, an older style of popular music began to give way to newer rock and roll, influenced by African American forms. Radio stations began to feature this new music that appealed to a younger audience, leaving many of the older fans with no music that sounded familiar to them. Increasingly, this audience turned to contemporary country music, which, in turn, moved closer and closer to the expectations of its audience. During this period, country-music radio outlets expanded dramatically, and this music captured a large urban following previously not interested in country music. A smooth sound developed that left out fiddles and steel guitars and incorporated drums and lush arrangements. Jim Reeves and Eddy Arnold typified this period.

From the mid-1930s forward, Los Angeles and other centers in Southern California have consistently been a counterbalance to the Eastern centers of country music. In the years after World War II, Southern California made significant contributions to the development of country music as artists from the East migrated West. In the 1960s, Bakersfield emerged as a major force in the development of country music, with artists like Buck Owens and Merle Haggard.

Since the mid-1960s, country music has gone in a number of related directions. On the one hand, traditional country music featuring steel guitar and fiddle has flourished with a new breed of younger country artists interested in "traditional" sounds. On the other hand, a new breed of crossover country music has developed. This music, marked by highly amplified instruments and elaborate stage presentations, has made inroads into the wider-pop music market. Garth Brooks is the most successful of these artists at this writing (1995).

The history of country music is marked by a movement from traditional material to commercial product and from regional to national markets. Nevertheless, country music has remained especially popular in regions that have ties to a rural past. One of the hallmarks of country music from the beginning has been a focus on an idealized life that never was. As country music became popular in the cities, there was a strong trend that idealized rural values from which many in the audience came or with which they identified. The past has always been portrayed as a better time in which values of old were paramount. A longing for the past has been present throughout the history of country music. In recent years, this has often translated into conservative political values, leading some observers to identify country music with middle-America, blue-collar values. In fact, it is a descendant of a populist theme that was found in the earliest days of the industry.

To understand the history of country music, one must not only focus on the recorded documents, but also examine the history of radio broadcasts of this music. In the earliest days, regional music was presented to a regional audience on a regular basis. Artists

would broadcast to a local audience and then tour the area making personal appearances. After “working out” an area, they would move on to another regional radio station and repeat the pattern. Gradually, recordings replaced the live broadcasts as a national market emerged. Today, there is little left of regional presentation. Television shows, once regional rather than local, are for the most part national. Radio shows increasingly rely on commercial recordings selected from national popularity charts. Several cable channels present country music, but these channels are distributed nationally even though they enjoy more popularity in certain regions of the country.

Ever since American soldiers took country music around the world during World War II, there has been increasing international interest in it—to the point that country music has become truly international in appeal, with fans throughout the world. Even the biggest record companies are international in both ownership and distribution. The regional music of the South has evolved into an international musical form.

Scholarship in country music developed slowly. A group of nonacademic researchers who worked independently of any academic discipline or institution ferreted out information about the early years of the country-music industry. These free-lance scholars conducted the initial and best early research into discography and biography of the earliest artists. They gained their first voice with the formation of the John Edwards Memorial Foundation (JEMF), which sought to bring them together with country-music musicians, industry representatives, and academic folklorists who were interested in this area of inquiry

The music industry, following on the heels of the JEMF, established the Country Music Foundation. Located in Nashville and supported by the music industry, the foundation houses the largest collection of materials documenting the history and development of the country-music industry. The archives of the John Edwards Memorial Foundation are housed in the Southern Historical Collection at the University of North Carolina, Chapel Hill.

Courlander, Harold (1908–)

Historian, essayist, ethnomusicologist, novelist, poet, dramatist, editor, and folklorist who played a major role in compiling and popularizing African American, Hopi, and Afro-Caribbean folktales. Born September 18, 1908, in Indianapolis, Courlander earned his B.A. from the University of Michigan in 1931. His professional career included nine years (1945–1954) as an editor at the United States Information Agency's Voice of America and more than fifteen years as an analyst at the United Nations. He served as editor of *United Nations Review* from 1956 to 1959.

Courlander was an indefatigable fieldworker; his first publication was a play, *Swamp Mud*, published by Blue Ox Press in 1936. This was followed by a vast outpouring of novels, poems, folklore collections, and nonfiction works as well as nine record albums for which Courlander served as collector, editor, and compiler. His record albums—most of which were taken from field recordings made in Haiti, Cuba, and Ethiopia—were distributed by the Folkways Ethnic Library Series and are still available from Smithsonian-Folkways Recordings. By any standard, Courlander's productivity is phenomenal; especially in light of the fact that he held nine-to-five jobs for most of his career. His writing and research were largely confined to weekends, mornings, and evenings.

Courlander is author, editor, or coeditor of more than thirty volumes of folktales, which cover such diverse geographical regions and cultural areas as the Southern United States, the American Southwest, Haiti, the Dominican Republic, Cuba, Nigeria, Ghana, Ethiopia, Indonesia, and the Pacific islands. His publications are difficult to categorize. They are not strictly anthropological monographs, folklore, or journalistic treatments, but fall between these genres. All of his published works have enjoyed wide distribution in the United States and abroad and are featured in the catalogs of both commercial and university presses.

He has also experienced a degree of notoriety. After much soul-searching, Courlander brought a successful copyright infringement suit against novelist Alex Haley in 1978. Haley ultimately paid him more than \$500,000, acknowledging that portions of Haley's *Roots* had been taken from Courlander's 1967 novel *The African*.

Perhaps Courlander's best-known publication is *The Drum and the Hoe: Life and Lore of the Haitian People* (1960; new ed. 1985), which James G. Leyburn hailed as "a fine example of bookmaking and a tribute to Courlander's perceptive respect for the culture." Also notable are *The Fourth World of the Hopis* (1971) and *People of the Short Blue Corn: Tales and Legends of the Hopi Indians* (1970), which vividly portray Hopi myth and history. The author visited northern Arizona reservations in 1968, 1969, and 1970 and began extensive conversations with Hopi elder Albert Yava. These conversations culminated in *Big Falling Snow* (1978), a well-received attempt to accurately represent Hopi religious beliefs and practices from a native's point of view.

His novel *The Bordeaux Narrative* (1990) skillfully examines the universe of voodoo through the eyes of a late-19th-century Haitian peasant who sets off to rescue a brother

who has been turned into a zombie. As Stephen D. Glazier (1992) notes, *The Bordeaux Narrative* serves as an “excellent vehicle for its author’s vast knowledge of Haitian folklore as well as an opportunity to demonstrate his keen eye for ethnographic detail.” In this—as in all of his publications—Courlander sees himself first and foremost as a storyteller preserving cultural legacies from one generation to the next.

Cousin Jack Stories

Brief, generally fictitious, humorous narratives involving 19th-century immigrants from Cornwall who followed the hardrock mining occupation acquired in the old country. Although some attribute the term “Cousin Jack” to the habit of ‘cussin’,” more link it to chain migration: A Cornishman with a job in a mine would invariably recommend his “Cousin Jack” when a vacancy opened. Cornishwomen were known as “Cousin Jennies.”

As in life, the Cousin Jacks of jokes were miners who might fancy a drink despite their Methodism. Their wives were inclined toward temperance and the baking of saffron buns and pasties (meat-and-potato turnovers). Men and women alike spoke a dialect marked by elongated vowels, a missing *g* in present participles, and the paradoxical coupling of an absent *h* at a word’s beginning and its inclusion before vowels. Jokes commonly turned on dialect, as in the case of a miner beset by a growling dog. The owner reckons Towser is wagging his tail and will not bite. Cousin Jack replies: “‘E’s waggin’ ‘is tail at one hend and barkin’ at the hother. I doan’t naw which of ‘is hends to believe.”

Charles E. Brown first gathered this and other Cousin Jack stories in Wisconsin’s lead-mining region in the 1930s. The stories have also been documented in Colorado, Minnesota, Montana, and especially in the “copper country” of Michigan’s Upper Peninsula, where they persist.

Cow Tipping

Prank allegedly popular at colleges in rural areas of the United States, in which students tip over sleeping cows standing in the fields. Stories about cow tipping have circulated since the 1970s and probably earlier, but it has never been definitely established that the practice actually occurs. Cow tipping is celebrated not only in oral tradition but also on greeting cards and T-shirts.

Skeptics, including many farmers, argue that an adult cow, at upwards of 1,000 pounds (455 kg), is too big to tip, and further that cows, unlike horses, do not sleep standing up, although they may doze on their feet while grazing. However, syndicated newspaper columnist Cecil Adams (*Return of the Straight Dope*) (1994) reported a claim by a former student at Albion College in Albion, Michigan, that she had participated in a cow-tipping episode as a freshman in about 1980. After a party one evening, the woman and several others had traveled to a farmer's field and watched as two male members of the group crept up on a sleeping cow and tipped it over. The startled cow scrambled to its feet, and the predictable hijinks ensued. The woman could supply no corroborating witnesses, and despite Adams' appeals, no participants in similar stunts stepped forward.

The feasibility of cow tipping could be quickly determined experimentally, but the scientific community has been unaccountably lethargic in this respect, and the matter awaits its Madame Curie.

Cowboy Poetry

Poetry claimed by ranching people in the American West. It tells their story, represents their lives, chronicles their history, and elucidates their feelings. Cowboy poetry was born on the long trail drives of the mid- to late-19th century, when large groups of men enlisted in the unfamiliar and dangerous occupation of moving cattle on horseback through the wild lands of the Western frontier. Though this poetic tradition is stronger today than ever, there have been many changes in its form and content. In the early days, cowboy poems were either published or memorized for oral recitation. They took the ballad form with simple rhyme and rhythm schemes. Today ranching men and women write and recite poems in every modern form, yet great respect is given to older traditions, including the old-time recitation style.

It is curious that one occupation, that of a cowboy, is so charged with mythic qualities. There is a wealth of expression—written and told, sketched and painted, braided and sewn—in a single, relatively uncommon occupation. There are no historic narratives from the original cowboy days, the trail drives following the Civil War, that fully explain

the chemistry of an incredibly diverse lot of men brought together, in the wilderness, relying on each other and animals for long and trying odysseys. From this experience came an amazing amalgam of life that forever would identify Americans—a jazz of Irish storytelling and lore, Scottish seafaring and cattle tending, Moorish and Spanish horsemanship, European cavalry, African improvisation, and a reluctant observation of Native American survival that can be heard and seen in this way of life even today.

Most singing in the old times was unaccompanied. Ballads were performed with little regard for strict rhythm; singing was closer to storytelling. In other words, the line between song and recitation may have been less distinct in earlier times. To understand this, notice the older Pentecostal preaching styles, which teeter between song and oration. The drama of the story dictated the rhythm more than some cosmic metronome did.

In discussing cowboy poetry, it is difficult to isolate the life of cowboys from their expressive existence, which simply reflects the life. In chronicling the poetry of cowboys, the word follows the trail of history. Before the century's turn, poetry and song tended to contain the nostalgia of the Victorian era and a loneliness from the trail for loved ones back home. Songs and poems such as "Bury Me Not on the Lone Prairie" were predominant. In the earliest ballads, there was also a plea for respect, as in this song from the 1860s, "The Western Pioneer":

The cowboy's name is butchered by the papers in the East,
 And when we're in the city we're treated like the beast.
 But in our native country our name is ever dear,
 And you bet we're always welcome by the western pioneer.

By the 1880s, romance had entered the stories. One of the earliest published examples is the poem "Lasca" written by an English theatre critic, Frank Desprez, and published in the *Montana Stock Growers Journal* in 1888. This work, one of the most widely recited cowboy poems yet today, enjoyed wide distribution in American society, not only around the campfire but in Victorian parlors and chautauqua programs. It began:

I want free life and I want fresh air,
 And I sigh for the canter after the cattle,
 The crack of a whip's like shots in battle,
 The medley of horns and hoofs and heads
 The wars and wrangles and scatters and spreads
 And dash and danger and life and love
 And Lasca! Lasca used to ride....

Lawrence Chittendon, the first to publish a widely distributed book of cowboy poems, had a hit with "The Cowboy's Christmas Ball." Written in cowboy dialect, it is one of a few poems in his 1893 collection *Ranch Verses* that is not rife with Victorian stuffiness and sentimentality. A caricature of a cowboy dance, it was embraced by ranch folks and

entered the folk tradition. By the early part of the 20th century, John Lomax had collected versions of the poem with melodies. Lomax recognized that the poem had been improved by the folk process; he wrote, "One night in New Mexico a cowboy sang to me, in typical cowboy music, Larry Chittendon's entire 'Cowboy's Christmas Ball'; since that time the poem has often come to me in manuscript form as an original cowboy song. The changes—usually, it must be confessed, resulting in bettering the verse—which have occurred in oral transmission, are most interesting."

When Lomax published his second collection of cowboy songs in 1920, *Songs of the Cattle Trail and Cow Camp*, he compiled a book full of poems that he claimed had been "set to music by the cowboys, who, in their isolation and loneliness, have found solace in narrative or descriptive verse devoted to cattle scenes." Unlike his groundbreaking collection, *Cowboy Songs and Other Frontier Ballads* (1910), there is no musical notation to these songs. Most of the verse in this second edition never had music; yet, curiously, Lomax claimed these poems as songs.

By the 1920s books of cowboy poems, cowboy recordings, and cowboy novels were spreading like prairie fire. The cowboy image was set on its own course, a course of music, filmmaking, and literature that as the years passed strayed increasingly from the reality of ranch life.

If there was a Golden Age of cowboy poetry, it was between the turn of the century and 1930, when cowboys who had lived the life on a fenceless range celebrated their culture. This was before the popular cowboy image was buried by the onslaught of popularizers. There was a genuine, though sentimental, celebration of the lifestyle. Poets like Curley Fletcher put the kinetic beauty of a bronco ride to words in "The Strawberry Roan"; Bruce Kiskaddon, who self-published a book of poems in 1924, the year before he quit cowboying and moved to Los Angeles to be a bellhop, wrote poems like "The Old Night Hawk," which have been favorites of ranch folks ever since:

I can see the East is gettin' gray
 I'll gather the hosses soon;
 And faint from the valley far away
 Comes the drone of the last guard's tune.

Yes, life is just like the night-herd's song,
 As the long years come and go.
 You start with a swing that is ou start with a swing that is free and
 strong,
 And finish up tired and slow.

Most widely published heroes of cowboy poetry from this golden age led lives with some position in society. Badger Clark, S.Omar Barker, Gail I.Gardner, and Henry Herbert Knibbs all were educated or were ranch owners. They had firsthand cowboy experience; yet they could take an outsider's view as well.

By the early 1980s, when folklorists began a concerted effort to document cowboy poetry and music, the commercial cowboy fire had burned out, and the ranching

community was adamantly suspicious of any interpretations of their culture by outsiders. At the same time, most were shy in presenting their story to a larger world. The art of the ranching community was an insider's affair, but this is no longer the case. Into the 1990s, true renaissance of cowboy arts is under way. It is powered by great pressure on a way of life foreign to the modern world. Grazing on the open lands of the West is being challenged by thirsty cities, recreationists, and environmentalists. Beyond a cry from the wilderness, beyond the mere nostalgic look at a vanishing past, there is strength and knowledge in this poetry, story, and song worthy of attention.

By 1995 there are more than 150 poetry gatherings in small Western towns, all spawned by the largest event of its kind, the Cowboy Poetry Gathering in Elko, Nevada. More than 500 books of ranch poetry have been published in the past century, as well as a handful of journals and magazines that print the work. The stories, songs, and poems that come out of this new movement recognize loss. They protest the modern world, offering advice to a disintegrating society. They make us laugh with the ridiculous, and they span the human experience of life and livelihood on the ranch. They tell stories that illustrate traditional values, about land and environment, about animal intelligence, about neighboring, cooperation, and about new sexual roles. Like most folk art, the themes are inherently best appreciated by insiders, but among the hundreds of men and women on ranches who write and recite poetry, there are some who have reached out to tell their stories to wider audiences. Several best-selling anthologies and recordings of this poetry have been released since the mid-1980s.

Cowboys

Mythical heroes of the Western United States, their image synonymous with ethics, integrity, loyalty, and rugged individualism. The cowboy's Hollywood, television, and literary romanticized image is a god-like figure, justified in administering punishment and death to those who are evil or are perceived to be evil, dishonest, or immoral. The 20th-century cowboy does believe in loyalty and independence and lives Western ethical values; he enjoys a limited amount of the romanticized image. Yet, the real working cowboy, past and present, bears only a partial resemblance to the image. The men and women who, indeed, do work cattle and horses live and work in the cold, heat, dust, rain, mud, and manure, and often they face pain, injury, and death; it is not romantic work, and the cowboy has not always enjoyed a mythical image.

The original "cow boy" was merely a boy who tended cows, but during the American Revolution, bands of Tory (loyalist) guerrillas and irregular cavalry, raiding mostly in Westchester County, New York, stole cows and other goods and called themselves cowboys. The next known usage was when Texas became a republic; a band of wild young men chased longhorns and Mexicans and called themselves cowboys, as did early Western outlaws. Even modern-day usage of the word occasionally implies a wild outlaw type or has a derogatory meaning such as "Reagan's cowboys." The mythical cowboy image came from the trail drives northward out of Texas following the Civil War; however, there were men who tended cattle long before the Texas trail herd/open range industry emerged.

Cattle and horses were introduced to the North American continent in Mexico by the Spanish. Settlers on the East Coast also brought cattle and horses, but the methods of tending, the tools, and the terminology used in the American West came from the Spanish and from Mexico. In Mexico and what is now the Southwestern United States, they tended, on horseback, large herds of cattle on wide open ranges, much different from the herd size and topography worked by settlers in the East and the Southeast. The story of the "hired man on horseback" in the Western Hemisphere, including Hawaii, is told by Richard W. Slatta in *Cowboys of the Americas* (1990), and, indeed, cowboys are working men on horseback hired by cattlemen-ranchers.

The terms "cattlemen" and "rancher" imply ownership, not cowboy skills; the large ranch cattlemen is confronted with the business of producing beef, decision making, buying and selling, profit or loss, hiring and firing, keeping up with scientific care and breeding of cattle, watching and working the "futures" market, and numerous other ownership problems. In fact, the modern-day cattlemen may spend more time at a computer than working cattle on horseback. Yet, this does not imply that ranch owners have limited cowboying skills, for many past and present cattlemen were and are excellent cowboys. Smaller-ranch owners usually work side-by-side with their hired men, but it is the hired man on horseback who became the romantic cowboy myth.

As the range-cattle industry moved northward out of Mexico through Texas toward the Northern Plains states, the men on horseback rarely called themselves cowboys. They

were cowmen, cowpunchers, cowhands, cowpokes, and other similar appellations, for most were young and did not want to be called “boys.” They were men living a “wild and woolly,” often dangerous, life on horseback in the wide open spaces—a life that gave them a sense of independence, an ethic of loyalty, and a belief in rugged individualism. Those men who served as the post—Civil War origins for the myth were mostly Southerners who migrated to Texas seeking a new life, and they carried strong English-Scottish traditions, particularly in their songs. But the Anglos were not the only cowboys in Texas.

Southern African Americans also migrated West, some escaping slavery before the war and others seeking a new life after the war. While most were hired for menial tasks, a few

became cooks and even fewer were given leadership responsibilities. There were African Americans who became ranchers with large land and cattle holdings, particularly along the coastal area of Texas, but generally the Anglos did not fight the Civil War to become trail-drive companions or bunkhouse pals with former slaves, and Black traditions, including music, made very little impact on cowboy culture. The greatest cultural influence came from Mexican *vaqueros*.

The Americanization of Spanish is part of basic cowboy lingo. *La reata* (the rope) became lariat, while *reata* indicates a rawhide rope. *Dar la vuelta* (to take wraps around

an object) became dally-welta, or dally roping, which means that the roper dallys the reata or lariat around the saddle horn until the cow is under control; this is the opposite of “tying hard and fast,” which means the lariat is tied to the saddle horn (the song “Windy Bill” tells the problem of tying hard and fast). *Chaparreras* (leg armor or leather leggings to protect the rider from thorns and brush) was Americanized to chaps. *Remotha* (remount) became remuda, a herd of extra horses, for on roundup and trail herding a horse needed two days’ rest after a hard day’s work. *Rodea* became rodeo, a cowboy contest, and there are other Americanized Spanish-Mexican words that are frequently heard.

A different strain of *vaquero* moved northward through California into Nevada and Oregon, and slowly the Americanization of the word *vaquero* became buckaroo. While they, too, were hired men on horseback, their style of clothing and tools varied slightly from cowboys of Texas and the Plains states, but their dedication to raising beef and to working horses was equal to the Texas strain of cowboys.

The Western saddle (no matter what style or region) and its decorations, the Western spur with its varied designs, the lariat and the method of roping from horseback, the organized open-range roundup, protective gear for horseman and horse, and other aspects of the range-cattle industry were greatly influenced by Spanish crafts and traditions. However, the general language, foodways, songs and music, basic clothing, and other lifeways were Anglo.

Another ethnic grouping of cowboys has basically been ignored by historians, folklorists, and image makers—the American Indian. It is wrong to categorize them into the umbrella term “American Indian,” for they are as diverse in language, culture, and traditions as is all of Europe. Each tribe had its own lore and history of contact with horses and eventually cattle. Raiding Spanish horse herds not long after they were introduced into their region, the Apaches were the earliest horsemen among the Indians, and the Five Civilized Tribes (nations of Cherokee, Choctaw, Chickasaw, Creek, and Seminole) were probably the earliest cattle herders. Following their forced removal into Indian Territory (Oklahoma) in the 1820s and 1830s, particularly the mixed-blood members reestablished their businesses. By the 1840s and 1850s, herds of cattle were grazing in the Nations, and when Texas cattlemen drove herds up the old Texas Trail through eastern Indian Territory to Missouri, Indian cattlemen often joined the drive. Unfortunately, many of those drives were unprofitable, and they created a hatred of Texas cattle through the spread of Texas fever among the herds along the trail.

As buffalo were slaughtered and as ranching and farming spread throughout the West and into Canada, a few surviving Plains Indian tribes slowly turned to cattle raising for subsistence. Their successes, failures, and problems are told by Peter Iverson in *When Indians Became Cowboys* (1994).

Cowboys versus Indians has been a common theme in dime novels, Western novels, movies, and television, when, in fact, there was limited conflict between them. In early-day Texas and occasionally in other areas, there were some problems and conflicts, but cowboys and Indians have much in common. They love and respect the Earth and depend upon it for life, and their love and respect for horses is mutual. Especially in Oklahoma, ranchers, cowboys, and Indians are often one in the same, for full-blood and mixed-blood Indians own ranches and work their cattle. Following the Civil War, land was leased to

cattlemen, and many Indians developed their own herds, some growing to as many as 15,000 head of cattle.

In 1867, when the cowboys who became the myth drove their herds toward Kansas, they crossed the Red River into the Chickasaw Nation and then crossed the Cheyenne-Arapaho Reservation into the Cherokee Outlet (owned by the Cherokee Nation). The Chickasaws, Choctaws, and Cherokees organized their own cattle associations to register brands and combat rustling, and they were cowboys who carried Anglo cowboy traditions as well as Indian traditions.

Cowboy traditions did not appear overnight, for as with other occupations the idiom (even with Spanish-Mexican influence) and clothing styles required time to become relatively standardized and traditional. Existing evidence indicates that songs and poems in the cowboy idiom using cowboys as the theme were not sung or recited prior to 1870; perhaps the exception is the granddaddy of cowboy songs, "The Old Chisholm Trail," since it is structured with disconnected couplets and a refrain.

Cowboy ballads and lyrical songs that slowly came out of the trail-drive experience received little non-cowboy attention until the turn of the century, and were generally touted to be songs from Texas with no known authorship. While Nathan Howard "Jack" Thorp compiled the first collection of cowboy songs, it was John Lomax's *Cowboy Songs and Other Frontier Ballads* (1910) that became the standard collection and also standardized lyrics, but scholarly research in the last half of the 20th century has identified the writers of many of the great and popular traditional ballads and songs as being non-Texans. These include Jack Thorp (New Mexico), Curley Fletcher (California and Nevada), Charles Badger Clark Jr. (Arizona and South Dakota), D.J.O'Malley (Montana), and many others.

The mythical cowboy also is often depicted as a singer with a guitar. Yet, few cowboys past or present have been singers, and only a few have had good voices. There also are other misconceptions about singing cowboys. The image of riding a horse at full run and singing a song to quell a stampede indicates a lack of experience with riding and singing, for not only is it impossible to sing under those conditions, but also thousands of stampeding cattle could not have heard a melodic voice, even an operatic voice at full volume. When oldtime cowboys shouted, "Sing out to them," they were telling other cowboys to yell or make loud sounds. Songs were not written or sung to the gait of a horse, for each horse has individual gait characteristics and some are stiff-legged animals. Also, nearly 50 percent of the older cowboy songs are in waltz time, and not many horses have a $\frac{3}{4}$ rhythm gait.

The guitar was not a popular musical instrument in the United States until after the turn of the century. There may have been an occasional guitar in a bunkhouse, but it was too bulky to carry on a trail drive. It became associated with the cowboy in the 20th century through radio, recordings, and movies. The instrument most often heard was the fiddle, followed in popularity by the banjo, and the harmonica was as scarce as the guitar. In fact, if a cowboy sang, it was usually as an unaccompanied vocalist.

Among 19th-century cowboys, the most popular songs were sentimental and music-hall songs, traditional ballads, a few hymns, and, particularly, bawdy songs. A few cowboy- and outlaw-themed songs made their way through the cow camps, but the bulk of songs about cowboys were written in the 20th century.

Clothing varied slightly from region to region, simply because of the variation in climate, but a neckerchief was standard. In dry, dusty areas, it was used to cover the nose and mouth to filter out dust; in colder regions, its primary purpose was for warmth. With the passage of time, the neckerchief became decorative as well as utilitarian; in Texas the bandanna was known as a “wipe.” In states such as Montana and Wyoming, the colorful silk neckerchief was, and is, a “tuf rag” or a “wild rag” and is still used for warmth and decoration; in Texas, Oklahoma, New Mexico, and warmer regions, the neckerchief is rarely used among working cowboys.

Chaps also had and have regional variation in style. The Mexican *vaqueros* wore tight leggings; in Texas the “bat wing,” or chaps with flaps made of thick leather, became the popular style. In colder states, chaps made of Angora goatskin or bearskin were popular, for they were warmer and the hair shed rain better than the all-leather chaps. However, Angora chaps became identified with “dudes.” In California and Nevada, the smaller chaps (known as chinks) that cover the upper leg instead of the entire leg were the style, and by the latter part of the 20th century chinks had spread in popularity throughout the Western states.

Other regional variations in the working-cowboy world exist. The most common belief, even though it is not necessarily true, is that cowboys from colder regions are better rough stock riders, and that cowboys in the warmer climates are better ropers. This was a strong belief among cowboys who followed the rodeo circuit when rodeo cowboys were also working cowboys, not professional athletes.

The 20th century saw many changes in the cowboy world. Feedlots, where cattle are gathered to fatten before being shipped to the slaughterhouse, grew in demand and size and required cowboys to tend them. The number of feedlot cowboys has grown, and in regions where grass is abundant and supports more cattle on smaller tracts of land, the size of a cow spread is smaller. In these areas, it is not uncommon to see the cowboy-owner drive his truck to the pasture, honk the horn, and the cattle come to be fed. The use of three-wheelers instead of horses is practiced on some ranches. No matter how they move around the ranch, working cowboys still have to tend catde—feed them, doctor them, pull calves, and do other tasks involved in cattle raising, working any time of day or night in all kinds of weather. It is not romantic work.

Since the beginning of the trail drives and range-cattle industry, each generation has stated that the real cowboy dies with that generation. There are scholars and writers who have predicted the death of cowboying as a way of life, and even though the myth makers and the image shapers have created a romantic mythical cowboy there still are real working cowboys. Cattle have to be cared for, and as long as people eat beef there will be real working cowboys.

Cox, John Harrington (1863–1945)

American folksong collector and editor, educator, doyen of the West Virginia Folk-Lore Society. Cox was born May 27, 1863, in Madison County, Illinois. Educated at Illinois State Normal, Brown, and Harvard Universities, he advanced to full professor of English philology at West Virginia University in Morgantown, where he resided from 1903 until his death on November 21, 1945. His book *Folk-Songs of the South* (1925) signaled the maturation of academic folksong collection and publication in the United States.

Cox came to folksong through an interest in medieval narrative poetry. In 1913 he spearheaded the formation of the West Virginia Folk-Lore Society, with himself as president, archivist, and editor; as he would later allow, “the activities of the Society centered in its President.” Indeed, the society’s one notable achievement was the publication of Cox’s *Folk-Songs of the South*, based on his 1923 Harvard dissertation and the source of the foregoing quotation.

Notwithstanding its various precursors, *Folk-Songs of the South* was truly the first of the major regional collections of American folksong; any shortcomings aside, it remains one of the best. Although the book follows the then almost obligatory “Child-and-odier” organization (assigning, that is, first place to older British ballads), it also includes a remarkable variety of other migratory and local songs and song types. Overwhelmingly textual in emphasis (there are only twenty-nine tunes for the 446 texts), and with virtually no information on sociocultural functions or performance settings, it nonetheless features some data on the singers and their communities. Despite his implicit acceptance of oral transmission as final proof of “folk” status, Cox simultaneously admitted considerable evidence for the traditional role of popular print. His cogent yet often extensive headnotes are models of the folksong scholarship of their day.

Some of the book’s imbalances were redressed in two subsequent volumes, *Folk-Songs Mainly from West Virginia* (1939) and *Traditional Ballads Mainly from West Virginia* (1939), which were reprinted together in 1964. However, *Folk-Songs of the South* is and will rightly remain the basis of Cox’s reputation as a seminal American folklorist.

Coyote

Animal of the canine family, a Western Native American trickster figure, and a person of mixed blood. Scientifically classified as *Canis latrans* (barking dog), the animals are popularly known by the Spanish name *coyote*, originally borrowed from the Nahuatl *coyotl* and later appropriated into English, wherein they were first called “prairie

wolves.” The trickster Coyote predominates in traditions of Northwest coastal and interior, California, Southwest, and Southern Plains tribes and is also found in Meso-America. As a social classification, “coyote” derives from the Spanish colonial *casta* system, a legal plan to categorize and stratify a polyethnic society. In the American Southwest, the term came to designate Spanish and Indian or Black, and later Anglo and Indian or Hispano and Mexican, mixture.

Originally native to open plains in North America, the nineteen recognized subspecies of coyote are now usually “edge animals” that migrate to various “edge” terrains after human encroachment onto their natural, range territory. Widely distributed in all states west of the Mississippi River and from Alaska to Costa Rica, in the American West the prolific coyote is often considered a destructive carnivore. The first printed description of “the Spanish fox” or “the Adipus (jackal)” appears in Francisco Hernández’s 1651 *History of the Animals and Minerals of New Spain*. Its scientific name was assigned by American zoologist Thomas Say during an 1820s expedition to the Rocky Mountains. Natural-history-folklore accounts include Mark Twain’s 1861 encounter with “cayote,” described in Chapter 5 of *Roughing It* (1872), and J. Frank Dobie’s *The Voice of the Coyote* (1949), but much more systematic, integrative work remains to be done before the biological and cultural “animal” can be fully articulated.

Coyote stories proliferate in folklorists’, anthropologists’, and linguists’ Native American collections and translations since the 19th century. Often bowdlerized, such texts have been variously classified, usually etically, as humorous anecdotes, jokes, animal tales, folktales, legends, and/or myths—epic or episodic narratives involving a sacred and/or secular “trickster-transformer-culture hero” (Ricketts 1966). William Bright anthologizes Native American oral traditions and English-language literary texts by Indian, Latino, and Anglo writers to present a “natural history” of mythic Old Man Coyote as wanderer, *bricoleur*, glutton, lecher, thief, cheat, outlaw, spoiler, loser, clown, pragmatist, (horny) old man, and survivor (Bright 1993). Like Bright’s, most studies establish Coyote as generically male and transformatively female or sometimes hermaphroditic, partly reflecting bias in available collections and interpretations, which generally overlook or obscure emic understandings wherein Coyote may be considered generically female or equally engendered and empowered by either sex.

As trickster, Coyote remains anomalous: a powerful, paradoxical, polysemic, liminal figure who is at once ambiguously animal and human, social and antisocial, deity and mortal. Barbara Babcock ([1975] 1985) argues for the generativity of this fundamental ambivalence and contradiction in the bewildering profusion of trickster tales. Coyote’s “foolish” antistructure challenges the structured world and creates multiple reconfigurations and illuminations of it.

Careful ethnographic and performance study reveals Coyote’s great variety and complexity. Folklorists studying Navajo Coyote stories have tried to distinguish between sacred texts about a Holy Person deity and secular tales of Trotting Coyote, but Barre Toelken (1971:204) found Navajos make no distinction between Ma’i (Coyote) the animal, the power in all coyotes, the narrative character, and the mythological symbol of disorder. Ma’i is an “enabler” whose humorous but serious stories, Yellowman (one of Toelken’s sources) states, are told to children so “they will grow up to be good people” and to adults because “through the stories everything is made possible” (Toelken and Scott 1981:80). Telling stories in properly performed Navajo language creates reality,

and Toelken distinguishes four levels of meaning in Coyote narratives from the Navajo perspective: entertainment, moral or evaluative, medicinal, and witchcraft. The first two are appropriate subjects of conversation and inquiry by Navajos and folklorists; the last two are crucial and esoteric for Navajos and should not be broached by outsiders (Toelken 1987).

Borderlands Mexican folk narratives more commonly depict Coyote as trickster-dupe than mediating figure, according to Theresa Melendez. Spanish and non-Spanish speakers on both sides of the border class as *coyotes*: smugglers illegally transporting people for profit, migrant-labor contractors, black-market Mexican money vendors, and fraudulent attorneys with no legal training, while “a woman who is accused of tempting and deceiving men is called a *coyota* (which a civil liberties organization of prostitutes convening in San Francisco has picked up as its name, COYOTE: ‘Call Off Your Old Tired Ethics’)” (Meléndez 1987:224). The colonial term *coyote* has come to designate mixed bloods or the *mestizo* generally, may be used derogatorily or affectionately, and now can simply indicate the indigenous or native.

Crafts

Objects made by hand from materials in the local environment that reflect established norms and techniques within a community, transmitted through informal channels such as word of mouth or demonstration. Crafts produce traditional homemade objects that are primarily functional but may be decorative as well.

The etymology of the word “craft” links it to notions of strength, power, force, and virtue. Only in English does it transfer to conceptions of skill, art, or some skilled occupation. Even then, as Simon J. Bronner points out, crafts remain

objects that have both physical and intellectual consequences; they extend ideas and feelings into three-dimensional form (Bronner 1986).

In preindustrial America, crafts fulfilled a need to make things for oneself rather than rely on outside suppliers. People made what they needed to solve the practical problems of shelter, food, clothing, transportation, and entertainment. Tools and textiles, baskets and pots, boats and buildings, toys and musical instruments all were made by hand according to community traditions of pattern, process, and style. Products of the craftperson's hands were judged by community norms. The process of craft production was sometimes a community event, such as a quilting bee or a barn raising; sometimes it demanded the solitary work of wood carving, weaving, or silversmithing. Crafts were a social force in the life of colonial and pioneer communities.

As the United States industrialized in the mid- to late 19th century, the need for handcrafted items declined as manufactured goods, readily available in stores and catalogs, solved the problems of domestic life. With increasing urbanization and availability of commercialized goods came a wave of nostalgia in which rural life and its handmade artifacts came to represent a kind of Romantic idealism and moral purity that seemed lacking in urban life.

The renewed interest in crafts in America was influenced by the Arts and Crafts movement in England that began in the mid-19th century. John Ruskin decried the sameness and tedious perfection of manufactured goods and argued for the essential humanity of handcrafted artifacts in *The Stones of Venice* (1851). Ruskin's rules for craft called for (1) the classical notion of *invention* in the making of articles rather than the industrial ideal of identical fabrication, (2) the irregularity of hand-finished artifacts over the exact finish produced by machines, and (3) the stamp of individuality working within a tradition rather than rigid imitation or copying of forms and styles.

Ruskin's work influenced William Morris, a young Oxford student, who ultimately created his own firm for the creation of craft and craft designs in decorative art in the 1860s. By 1888 England had a Guild and School of Handicraft and an Arts and Crafts Exhibition Society; this was, incidentally, the same year the American Folklore Society came into being.

Interest in Ruskin's and Morris' ideas of decorative arts as a moral force surfaced in America by the 1870s. Decorative ceramics, built on the tradition of functional folk pottery, became popular with socially prominent young women in urban centers who organized clubs and exhibitions for their work throughout the 1870s and 1880s. Lucie-Smith argues in *The Story of Craft* (1981:223) that this early interest in pottery provides a glimpse of the wide spectrum of American attitudes toward crafts, including the involvement of amateurs, especially women; a willingness to borrow ideas from many sources; an interest in experimentation for its own sake rather than for utility; a strong business sense about craft marketing; and an interest in craft, not only for its own sake, but as a medium of education.

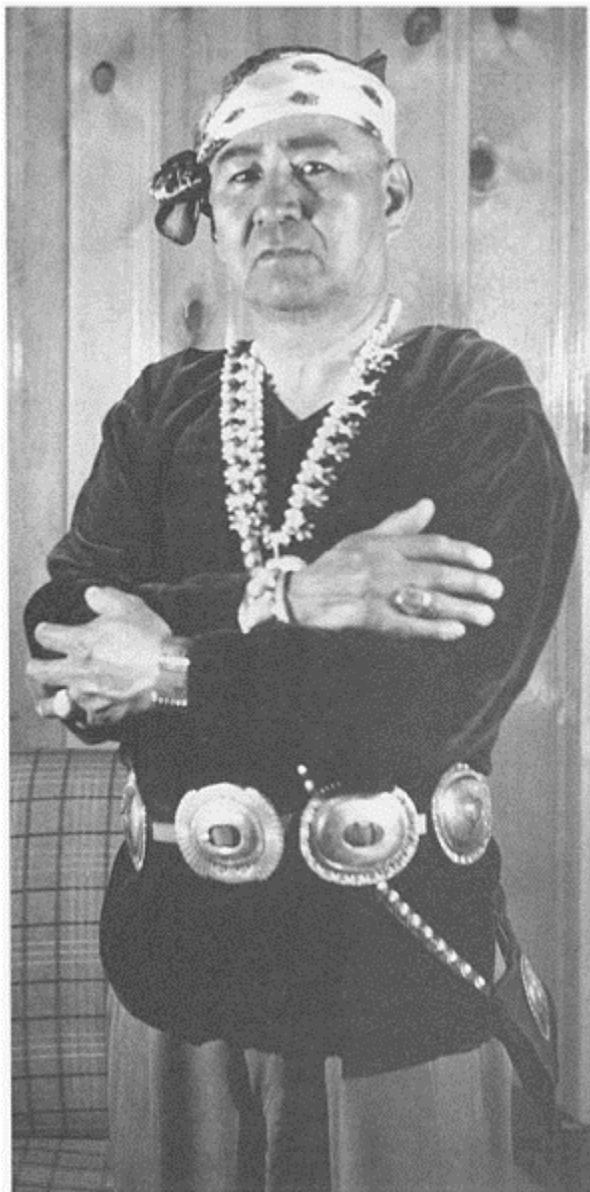

By the turn of the century, handicraft clubs and guilds, arts and crafts centers, and magazines such as *Handicraft* and *The Craftsman* (devoted to William Morris) flourished throughout the United States. *The Craftsman* praised the art, work, and lives of preindustrial people and suggested that modern Americans could simplify their lives by owning native crafts and thereby identifying with "the people" (Boris 1987:217).

This suggestion promoted interest in crafts produced by ethnic minorities within America, particularly Native Americans, and cultural minorities such as Appalachian mountaineers. For example, in 1879 John Wesley Powell, a self-taught anthropologist and charter member of the American Folklore Society, lobbied for a national agency to study Native American culture. His work resulted in formation of the Bureau of American Ethnology (BAE) that documented Indian life.

Many crafts were on the decline in their native communities in the industrial and commercial boom of the late 19th century, but entrepreneurial educators and social reformers encouraged their revival with missionary zeal. They believed, in fact, that crafts embodied the ideal of culture and uplift they hoped to bring to what they believed were their more primitive, impoverished brethren.

In Appalachia, for example, President William Goodell Frost of Berea College in Kentucky recognized the quality and potential market value of crafts, particularly handweaving, and started a work-study program at the college called the Fireside Industries in 1893 (Barker 1991). Frost took a horseback tour of students' homes in southern Appalachia that year and saw handcrafted baskets, chairs, coverlets, crockery, and other items that he thought had market potential with the college's New England supporters. In 1896 he organized the first Homespun Fair at Berea to encourage craft production in the region.

Frost's efforts were quickly emulated throughout the region at Allanstand Cottage Industries, Biltmore Industries, Penland School, and the John C. Campbell Folk School in North Carolina, the Pi Beta Phi School (Arrowmont) in Tennessee, and Hindman and Pine Mountain Settlement Schools in Kentucky. By the late 1920s, the craft movement in Appalachia had attracted the interest of Allen Eaton of the Russell Sage Foundation in New York City, long a proponent of the value and virtues of crafts. Eaton had promoted interest in crafts from all types of rural and ethnic groups throughout America in his work with the American Country Life Asso-

ciation and the American Federation of Arts.

Eaton helped the various craft cooperative groups throughout Appalachia form the Southern Highland Handicraft Guild in 1930. The goals of the guild included

preservation of mountain craft work and creation of national markets for the crafts as a step toward economic independence for the people of Appalachia. In the 1930s, the guild offered several regional and national exhibitions of mountain crafts, and Eaton published his comprehensive and influential *Handicrafts of the Southern Highlands* (1937).

As David Whisnant (1983) points out, the story of crafts in Appalachia evolved into a story of cultural intervention in which forces outside the local communities shaped the processes, design, production, and marketing of what had been traditional craft work into craft work for widespread commercial consumption (Whisnant 1983). The idea of using crafts as an educational and moral force, as well as an economic boon, also reflected the educational and moral values of middle-class America and not necessarily the values associated with handmade work in the local community.

The saga of craft development in Appalachia was repeated among numerous Native American groups, Eskimos, African Americans, and Pennsylvania Germans. The Arts and Crafts movement in America in the late 19th and early 20th centuries associated crafts with vanishing rural life, so that crafts seemed to be survivals or precious relics of an earlier, simpler, more idyllic life. This led to a self-consciousness in craft production that altered the natural cultural impulses for craft artistry and caused the place of craft in urban life largely to be ignored.

The Depression years of the 1930s fostered attention crafts as a way to recognize the contributions of immigrant groups in America and to increase self-esteem among all Americans hard hit by the economic crash. Allen Eaton followed his work in Appalachian crafts with exhibitions and a book on immigrant contributions to American life (Eaton 1932). President Franklin D. Roosevelt, through the mechanism of the Works Progress Administration (WPA), put writers, artists, and musicians to work recording all manner of American life, including crafts. The massive *Index of American Design* contained thousands of drawings of handicraft utensils, carousel animals, scrimshaw carvings, and similar objects (Green 1977:5). Other federal agencies, such as the Extension Division of the U.S. Department of Agriculture and the Division of Subsistence Homesteads in the Department of Interior, encouraged the production of crafts to provide domestic necessities and supplement family incomes during the lean years of the Depression and its aftermath.

Interest in crafts was subsumed by the heightened industrial production of the war years of the 1940s and the increasing emphasis on science and high technology in the postwar 1950s. Handcrafted work seemed irrelevant in a world of atomic bombs, television, and ventures into space. But the 1960s brought a backlash to mass consumerism and what seemed to be increasingly dangerous technological developments.

Folk music provided anthems for the 1960s and ushered in a new era of interest in making folk instruments and handcrafted clothing. The principles of cultural pluralism and ecological harmony that guided the 1960s and 1970s foregrounded the contributions of America's minority groups, including women, African Americans, Native Americans, Hispanics, religious minorities, and rural people in general, and fostered a resurgence in craft production among these groups. Popular books such as the *Foxfire* series created appreciation for making and studying traditional crafts in a vast public audience. A shift in emphasis among some folklorists from the study of "folklore" to the more inclusive "folklife" helped launch such ventures as the Festival of American Folklife in 1967, a festival that featured craft demonstrations on the national mall in Washington, DC,

creation of a folk-arts program in the National Endowment for the Arts in 1974; and passage of the American Folklife Preservation Act of 1976 that created the American Folklife Center at the Library of Congress.

Contemporary interest in handcrafted items has never waned since the fertile period of the 1960s and 1970s. Among folklorists, crafts are studied and documented with particular attention to the cultural context in which they are created. Much craftsmanship has become increasingly tied to standards set by distant and alien markets. For example, Hmong textile work changed from traditional geometric patterning to narrative storycloths with subtitles in English when refugees left Southeast Asia for the cities of the United States. These changes were responses to demands of the Western marketplace (Conquergood 1992).

Another significant change in craft work is the continual blurring of the line between craft and fine art (Lucie-Smith 1981:277). Many craft artists have ambitions for their work to be judged by the same criteria as fine art, with little reference to the utilitarian qualities of the craft, and often based on conceptions drawn from avant-garde art. Some critics have suggested that the category of craft is no longer meaningful when it can embrace those who still visibly embrace a traditional craft in their own communities and artist-craftspersons who create craft for pure contemplation. Others suggest that craft must embrace both the amateur and the trained artist-craftsperson because both represent a “necessary antonym” to industrial society and visible reminders of where industry originates.

As Bronner argues, the handmade object in contemporary life more than ever draws symbolic and social attention to itself as it raises questions of purpose, celebrates control of some aspect of life for its maker, and, for a mass society, gives a tangible reminder of involvement (Bronner 1986:8, 216).

Crane, Thomas Frederick (1844–1927)

Professor of Romance philology, founding member of the American Folklore Society, and the leading representative of European folklore scholarship in the United States for several decades. From the 1870s until his death, Crane published articles, books, and scores of reviews in literary and scholarly journals that remain valuable resources for folklorists.

Crane's reviews of *Folklore Fellows Communications* Vols. 1–21 (Crane 1916) introduced this important series to American folklorists and helped Antti Aarne, an early Finnish folklorist, gain a professorship in Finland. His review of Joel Chandler Harris' *Uncle Remus* tales and their parallels provided important evidence for the African origin of African American narrative. In an 1883 paper on "Mediaeval Sermon-Books and Stories" and his 1890 critically and comparatively annotated edition of *The Exempla of Jaques de Vitry*, Crane surveyed the field of exempla research and established the significance of these religious tales as stores of cultural information. This work set off a new field of research in Europe and, later, the United States. Other publications on exempla, Italian folktales and customs, French folksongs and the tales of the brothers Grimm remain models of comparative folklore scholarship.

Upon invitation from William Wells Newell, Crane served on the editorial board of the *Journal of American Folklore* from 1888 to 1892 and contributed a survey of European folktale theory to the first issue. But Crane seems to have played a minor role in steering the further course of the journal, which failed to publish a notice of his death.

Creighton, Helen (1899–1989)

Folklore collector and disseminator. Creighton was a regionalist who documented and promoted the folklore of Canada's Maritime Provinces, especially her native Nova Scotia. Her primary interest was Anglo Canadian folksong, but she also collected other genres and from other groups.

Born into an upper-middle-class family, Creighton first became interested in folklore as a young woman trying to establish a career in journalism. A self-taught collector, she was influenced initially by the English Folk Song and Dance movement but, after attending Indiana University's Folklore Institute in 1942, was aware of developments in American folkloristics.

From 1928 she collected folklore and published sixteen books without university affiliation and with limited institutional support. In 1943 the Rockefeller Foundation provided her with Library of Congress recording equipment; the National Museum (now the Canadian Museum of Civilization) made her an adviser from 1947 to 1964, supplying her with a tape recorder from 1949 on. She is remembered as a skilled fieldworker, eclectic in scope and sensitive to community dynamics.

Creighton was innovative as a popularizer, using print and broadcast media to publicize folklore. Her work also inspired many adaptations including *Sea Gallows*, a ballet performed by Montreal's Les Grands Ballets Canadiens (1958) and *The Celtic Mass for the Sea*, an orchestral work by composer Scott MacMillan for Symphony Nova Scotia (1988). Creighton helped shape provincial and regional identity, and one folksong she collected, "Nova Scotia Song," is the Nova Scotian anthem.

She received many public honors, including six honorary degrees and the Order of Canada (1976). Dartmouth, Nova Scotia, operates her former home as a museum and since 1990 holds an annual folklore festival in her memory. Despite her public appeal, however, she has had little impact on Canadian folklore studies, since folklorists were slow to appreciate her work.

Crimelore

A widespread theme in oral tradition concerning the individuals who violate the laws, either within the society they live in or within the context of the folkloric form in which they appear, and, of the victims who are affected by their unlawful actions. Crimelore is as widespread in the American folk tradition as it is within many aspects of contemporary society. Crime themes appear in almost every genre of folklore, but particularly in balladry and folksong, tales about legendary outlaws, and in contemporary urban legends. Crimelore, too, has its own esoteric components found in the folk speech or jargon of criminals, stories about “confidence men” or swindler-tricksters, as well as the personal-experience stories about criminal activities told by incarcerated prisoners and victims of urban crime.

Oral tradition is filled with stories about notorious criminals and their exploits. These include stories about outlaws of the 19th-century Wild West, such as Jesse James, and gangsters of the 20th century, such as the robber-murderer John Dillinger of Indiana and Al Capone, the crime boss of Chicago, who sold illegal liquor during Prohibition. In contemporary times, stories have circulated about mass murderers, such as ringleader Charles Manson of the 1960s; Albert DeSalvo, the Boston Strangler; and Jeffrey Dahmer, the cannibal murderer, among others. While these murderers become widely known via the media, stories about them often circulate in local communities and become part of the crimelore already circulating in that locale. Two examples of pre-media age localized tales that are still part of each community’s lore would be that of Belle Gunness of LaPorte, Indiana, and Lizzie Borden of Fall River, Massachusetts. Also known as the Lady Bluebeard, Gunness was believed to have murdered her family and several mail-order husbands and to have buried their remains in her backyard; the remains were discovered on her property after a fire in 1908. Lizzie Borden was known to have murdered her parents on August 2, 1892. The popular children’s song circulates in Fall River today:

Lizzie Borden took an axe,
Gave her father forty whacks.
And when Lizzie was all done,
She gave her mother forty-one.

One subtype of crimelore involves white-collar crime. This lore includes stories found in the workplace relating to office workers—from petty thieves to insider junk-bond traders (such as Ivan Boesky) whose actions could topple financial markets. Recently included as white-collar criminals are computer hackers who violate laws by pirating software and illegally transmitting software over computer bulletin boards. Stories are passed on about brilliant “electronic burglars” such as Robert Morris, who in 1988 achieved notoriety when he wrote a computer program that halted an important computer network.

In the Anglo American tradition, ballads about outlaws and outlaws regarded as heroes by the folk have circulated widely and are well known. Ballads that deal with criminal

activities fall into two types: those that explain the outlaw's escapades and are sung by a narrator who claims to have known of the outlaw's adventures; and those in which the central character, the criminal, relates his own tale of how he turned against the law and was later caught by the authorities. An example is "The Ballad of Jesse James." Missouri-born James was one of the most sought after bank and train robbers in his day. Along with his gang of twenty-two, he committed more than twenty-five robberies for a booty exceeding \$600,000. James was murdered in 1882 by a member of his own gang, Robert Ford, who was tempted by the \$10,000 reward for James' capture. He also wanted to be immortalized as the "man who killed Jesse James." The ballad refers to James' alias, "Mr. Howard," and describes the murder:

Jesse James was a lad that killed many a man.
 He robbed the Danville train.
 But that dirty little coward that shot Mr. Howard
 Has laid poor Jesse in his grave.
 It was Robert Ford, that dirty litde coward,
 I wonder how he does feel;
 For he ate of Jesse's bread and slept in Jesse's bed
 And he laid poor Jesse in the grave.

While some ballads recount the exploits of outlaws, others relate events of historic import, such the assassination of President James Garfield on July 2, 1881, by Charles Guiteau, who was hanged for his crime on June 30, 1882. In the well-known folksong "The Ballad of Charles Guiteau," the narrator, Guiteau, atones for his crime. Ballads of this sort are often categorized as the "criminal's good night," a ballad feature in which the criminal feels remorse for his unlawful actions. His "good night" is usually sung on the eve of his execution. In the following verse, Guiteau laments his fate:

My name is Charles Guiteau,
 My name I'll ne'er deny.
 I leave my aged parents
 In sorrow for to die
 But little did they think,
 While in my youthful bloom,
 I'd be taken to the scaffold
 To meet my earthly doom.

One of the most widely circulated murder ballads is about a young woman named Pearl Bryant of Greencastle, Indiana. She was beheaded by Scott Jackson, the father of her illegitimate unborn baby, and his accomplice, Alonzo Walling; both were executed in

1897. In some locales in Indiana, the ballad remains in oral tradition along with a legend concerning her ghost returning to the murder site. One ballad stanza explains the crime:

A horrible crime was committed,
 Soon was brought to light,
 For parents to look on their headless girl,
 'Twas a sad and dreadful sight.

Contemporary stories about crime are told by incarcerated men and women in prison and by criminals on the street. In these narratives about dangerous exploits, the stories are often filled with insider jargon, or folk speech used for nicknames, events, and everyday items. For example, the phrase “a songbird doing time in the Big House” describes a prison informer who has been sentenced to a federal prison. The use of everyday speech within prison, the prison culture, and the exploits of prisoners have been collected from prisoners by folklorists, most notably by Bruce Jackson.

Crime is a major issue in the everyday lives of many Americans, and so they create a folkloric form to deal with the anxiety of the possibility of being a crime victim. Most recently, crime-victim stories have been collected from urbanites who are constantly bombarded about crime by reports on television news, newspaper headlines, and stories that urbanites tell to one another about crime-victim events. These crime-victim stories, describing muggings, rapes, murder, and other physical assaults, are highly structured narratives that explicate a confrontation between an offender and his victim. Often, the teller describes where the event took place and the action between the story’s characters. Narrators often complete the narrative with an explanation of how the event was resolved and a coda, or comment, about the event or a general comment about the overwhelming intrusion of crime into daily life.

Crime-victim stories are told for several reasons. They impart crime-prevention skills, or “street smarts,” telling urbanites about safe and unsafe locales so they can adjust their mental maps of their urban environment. They reinforce the theme of bystander apathy: There are few Good Samaritans in the city. Following is an example of a crime-victim narrative as told by a New Yorker emphasizing the bystander motif and the premonition that crime is an interruption to daily life:

My friend was walking down the street one evening. She saw these four kids coming toward her and she said,... she was thinking to herself... “Why not go across the street? You know, ‘cause you never know.” But she started thinking why should she do that because there are just four kids walking down the street. Well, they got her! One had a knife and took her money and all that. (Wachs 1988)

Recently there has been a constant debate whether violence on television or in other forms of media (or folklore), promotes more violence in our culture, especially among teenage males. This issue has surfaced again with the acceptance of “rap” or “gangsta” music, a narrative, musical form relative to the African American toast. Both of these

spoken forms have common themes of violence, particularly against women, and rationalization for breaking laws. More, too, is heard about youth gangs, particularly those found in urban ghettos of large cities, whose members wear their own colors (or uniforms), stake out their own boundaries, and take on new personas or nicknames.

Crockett, Davy (1786–1836)

Famous frontiersman, Tennessee and U.S. congressman, defender of the Alamo, and legendary folk hero. Born in Greene County in east Tennessee on August 17, 1786, Crockett was an unknown backwoods hunter with a talent for storytelling until his election to the Tennessee legislature in 1821 as the representative of Lawrence and Hickman Counties and to the U.S. House of Representatives in 1827. He had promoted himself as a simple, honest country boy who was an extraordinary hunter and marksman, someone who was on all levels a literal “straight shooter.”

Political notoriety gave his image a life of its own by the 1830s, and Crockett became the model for Nimrod Wildfire, the hero of James Kirke Paulding's play *The Lion of the West* (1830) as well as the subject of articles and books. Tales swirled about him so thickly that Crockett said he was compelled to publish his autobiography (*A Narrative of the Life of David Crockett of the State of Tennessee*) ([1834] 1973) to counteract the outlandish stories printed under his name as the *Sketches and Eccentricities of Colonel David Crockett of West Tennessee*, published in 1833. Taken up by the anonymous Boston hack writers who spun out tall tales for the Crockett Almanacs (1835–1856), the fictional Davy expanded his role as a legendary backwoods screamer. He could “run faster, jump higher, squat lower, dive deeper, stay under longer, and come out drier, than any man in the whole country,” save the world by unfreezing the sun and the Earth from their axes, and ride his pet alligator up Niagara Falls.

Crockett's “corrective” *Narrative* can also be viewed as the first presidential-campaign biography, since he was being touted by the Whigs as the candidate who would oppose Andrew Jackson's handpicked successor, Martin Van Buren. Crockett's defeat in his bid to be returned to Congress in 1835 ended his presidential ambitions, and, temporarily disenchanted with politics and his constituents, he made the now famous remark: “You may all go to hell and I will go to Texas.” His last surviving letters spoke of his confidence that Texas would allow him to rejuvenate his political career and finally make his fortune. He intended to become land agent for the new territory and saw the future of an independent Texas as intertwined with his own.

He and his men joined Colonel William B. Travis in the defense of the Alamo, and Travis wrote that, during the first bombardment, Crockett was everywhere in the Alamo “animating the men to do their duty.” The siege of thirteen days ended on March 6, 1836, when the Alamo was overrun. Crockett and five or six other survivors were captured. Several Mexican officers asked that the prisoners be spared, but Santa Anna had the prisoners bayoneted and then shot.

Many thought that Davy deserved a better end and provided it, from thrilling fictions of his clubbing Mexicans with his empty rifle until cut down by a flurry of bullets or bayonets or both, stories that undergirded the movie portrayals by Fess Parker and John Wayne, to his survival as a slave in a salt mine in Mexico. No matter what the past or future directions of the legends of Davy Crockett, however, it is clear that his popularity

in the media from his time forward guarantees his continuing preeminence in the American mind as

Culin, Stewart (1858–1929)

Best known as a pioneer in traditional game research, particularly of Native American and East Asian peoples. Culin was an early president, in 1897, of the American Folklore Society and a founding member, in 1902, of the American Anthropological Association. He served as director of the University of Pennsylvania Museum of Archaeology and Paleontology from 1892 to 1903 and subsequently as curator of ethnology at the Brooklyn Museum's Institute of Arts and Sciences.

Fieldwork in Korea, Japan, China, and India was the basis for his *Korean Games, with Notes on the Corresponding Games of China and Japan* (1895, reprinted in 1958 as *Games of the Orient*). A comprehensive collection that remains an important reference, this work also makes readers aware of the many similarities among the world's traditional games and the important part games play in all societies.

Culin's most ambitious and enduring publication is his descriptive and classificatory *Games of the North American Indians* (1907, reprinted in 1975), in which he addresses questions about game implements and playing techniques, the relationships between games and other aspects of culture, the history and geographical distribution of selected games, and the nature of the similarities discernible in American Indian games and those of other (particularly Asian) peoples.

Between 1889 and 1900, Culin also published (in the *Journal of American Folklore* and the *American Anthropologist*) seminal essays on Hawaiian (Culin 1889) and Filipino (Culin 1900) games and on American immigrant and urban folklore, including, a Sicilian marionette theater in New York City; Chinese American dice, domino, and gambling games; African American sorcery; and urban-American boys' street games.

Cults

As understood by most Americans, deviant religious groups that pose a threat to society. Some such groups, such as the Reverend Sun Myung Moon's Unification Church (the "Moonies") are large, well-organized offshoots of Christianity; others, like Charles Manson's "Family" or Jim Jones' People's Temple, were small, short-lived dissident groups prone to violence (Melton 1986; Saliba 1990).

During the 1970s, many alternative religions were assumed to be cults gaining tight psychological control to brainwash teenagers they attracted. Deprogramming, a form of kidnapping and confrontational dialogue, became a popular form of attempting to remove adolescents from such groups. However, formal studies have shown that there is little value in such practices (Bromley and Richardson 1983). Nevertheless, a Gallup Poll conducted in the late 1980s characterized "cults" as the most despised groups in America.

Rumors and legends about minority religions have circulated since ancient times, the most notorious being the Blood Libel, in which the members of a cult are said to be kidnapping children, murdering them during a religious rite, and then cannibalizing their flesh and blood (Dundes 1991). First attached to Christians during Nero's reign, it was later used by the church to justify the persecution and mass execution of Jews, witches, and members of heretical sects. In 19th-century America, it was attached to Catholics, and after a mentally ill woman claimed to have been a former nun who was forced to "breed" babies for ritual murder, a nationwide wave of attacks on Catholic priests, convents, and churches followed (Billington 1938).

More recently, anticult rumors have been attached to "satanists," who in addition to committing ritual murder and cannibalism, secretly abuse children, force women to breed babies, and brainwash teenagers into committing suicide. The members of a cult may be said to commit murder or mutilation as part of an initiation rite, similar to the practices of youth gangs often thought to rob, mutilate, or kidnap women at shopping malls. They may use holidays like Halloween as opportunities to abduct and murder children. In one especially widespread legend, satanists are said to need a "blonde-haired, blue-eyed virgin" for a specific sacrifice, often on a Friday the Thirteenth.

The FBI (Federal Bureau of Investigation) has never been able to document any child abduction or murder as a satanic cult sacrifice, but believers attribute this to the influence of satanists in positions of power. Procter and Gamble, for many years, has been accused of giving money to cults—first the "Moonies," later devil-worshippers—and their logo supposedly contains satanic imagery (Fine 1992). Similar rumors have been attached to other corporations, such as Ray Kroc's fast-food chain, McDonalds; Liz Claiborne's clothing and cosmetics firm; and recording corporations responsible for producing "heavy metal" rock music.

Social scientists blame such legends on the defensive posture of traditional Christianity (Richardson, Best, and Bromley 1991). Nevertheless, sincere belief in satanic cults continues to circulate among law-enforcement agents (Hicks 1991). The presence of such narratives has influenced some groups and criminals to commit real acts of abuse

and violence (Ellis 1989), so that anticult lore has, ironically, helped bring into being the danger it feared.

Cultural Conservation

The protection of cultural resources, broadly defined as “community life and values,” in managing change and development. The term appears rarely in the literature before an American Folklife Center report (Loomis 1983) that defines it as “a concept for organizing the profusion of public and private efforts that deal with traditional community cultural life.” The center prepared the report for the Department of the Interior in response to a congressional request for information on the status of government policy and “intangible cultural resources.” In addition to stressing the need for greater coordination among government agencies with cultural mandates, the report recommended a more inclusive, flexible, case-by-case approach to identifying cultural resources and determining their significance. It also called attention to the unexploited potential of existing legislation, such as the National Environmental Policy Act of 1969, the National Historic Preservation Act of 1966, and the American Folklife Preservation Act of 1976.

Following the report’s publication, the term “cultural conservation” began to appear at conferences and festivals, and with increasing frequency in publications, as public-sector folklorists, state historic-preservation officers, and others involved with cultural planning explored its implications and published the results of their programs and discussions (Feintuch 1987; Howell 1990; Hunt and Seitel 1985; Hufford 1994). The cultural-conservation report led to increased cooperation between the National Park Service and the American Folklife Center, and various states began implementing cultural-conservation programs and initiatives, such as the state of Maryland’s Office of Cultural Conservation.

The concept has come under criticism from some quarters as a potential form of mystification (Kirshenblatt-Gimblett 1988). Historically, the scientific collection and classification of culture belonging to a putative unself-conscious “folk” has, in effect, silenced the politically powerless in decision making. Moreover, inventorying endangered traditions as if they are natural objects can serve to conceal the shaping hands and political agendas behind the inventories (Whisnant 1983). However, *history* is an essential tool for cultural construction, and development—whether of highways or wilderness—alters the course of history. In so doing, development often rearranges social relations together with the practices expressive of those relations. Where the course of history is at issue, consultation with its authors is critical. To many of its proponents then, the concept of cultural conservation essentially holds out the promise of democratizing the planning process and of broadening public access to the forces and policies shaping cultural change.

Cultural Landscape

A natural landscape shaped by people; essentially, the physical stage for human behavior. Cultural landscapes result from the same forces involved in creation of any vernacular artifact. The "place" may be as large as a river valley or as small as a kitchen garden.

Study of cultural landscapes has been the domain of geographers and material-culture-oriented folklorists. Geographer Carl Ortwin Sauer developed the concept in the 1920s, and geographer Fred Kniffen's articles made vernacular and folk buildings a focus in analyzing landscapes. Cultural landscape is a subject explored by scholars in many fields; writers such as Estyn Evans, W.G.Hoskins, Henry Glassie, William Tishler, David Lowenthal, Pierce Lewis, J.B.Jackson, Paul Groth, and Reynar Banham have made contributions to understanding cultural landscape, and most specialists in vernacular architecture include it in their studies. Jackson's founding of the journal *Landscape* in 1951 and his essays (see Jackson 1984) have made the study of cultural landscape a permanent field crossing disciplinary boundaries.

Cultural Studies

Interdisciplinary, transdisciplinary, and often counterdisciplinary project to describe, analyze, and theorize the ways in which cultural practices are entangled with, and within, relations of power. Taking much of its impetus from the works of Raymond Williams (*Culture and Society, 1780–1950* [1958] and *The Long Revolution* [1961]), Richard Hoggart (*The Uses of Literacy* [1958]), and E.P. Thompson (*The Making of the English Working Class* [1963]), cultural studies, as an institutionalized discipline, began with the founding of the Center for Contemporary Cultural Studies at Birmingham, England, in 1964. Since then, cultural studies has become an international set of discursive practices in which culture is viewed as a site of serious contest and conflict over meaning. *How* meaning is made, *what* meaning is made, *who* makes meaning, and *for whom* are explored through borrowings from Marxist—in particular revisionist (sometimes called “neo-” or “post-”) Marxist—writings on class; feminist writings on gender; postcolonialist writings on race, ethnicity, and nation; lesbian- and gay-studies writings on sexuality; and poststructuralist writings on language and other signifying systems. Folkloristics intersects with cultural studies when folklorists position folklore within the politics of cultural production—in other words, when folklorists address how folklore is shaped by, and in turn shapes, sociocultural power relations.

Rejecting the traditional humanities’ equation of “culture” with “high culture,” cultural studies instead accepts a more anthropologically based definition of culture made available in part by the “culture-as-text” metaphor developed in the writings of Roland Barthes (*Mythologies* [1957, 1972]) and Clifford Geertz (*The Interpretation of Cultures* [1973]). As Lawrence Grossberg and colleagues have explained, “All forms of cultural production need to be studied in relation to other cultural practices and to social and historical structures” (Grossberg, Nelson, and Treichler 1992). Thus, cultural studies is “committed to the study of the entire range of a society’s arts, beliefs, institutions, and communicative practices” (1992). But unlike anthropology, cultural studies has developed out of an analysis of modern industrialized societies—hence its practitioners’ early interests in class-based power relations (later expanded to include those of gender, ethnicity, race, nation, and sexuality) as well as the production, marketing, and consumption of popular forms of expressive and material culture, and the vernacular uses of those forms (drugstore romances and novels, journalistic writing, advertising, comics, film, television, video, various forms of music with mass and/or subcultural appeal, the fashion industry, the aesthetic arrangements of household items, as well as sporting events and such festive occasions as carnival).

Key to discussions of the popular have been Theodor Adorno’s theory of the anesthetizing, and thereby dominating, effect of “mass culture” and what he calls the “culture industry” (the commodification and industrialized reproduction of cultural artifacts); Louis Althusser’s explanation of how ideology (as a system of representations) positions people as “subjects” in a way that actually “subjects” (subordinates) them to the interests of the ruling classes; and Antonio Gramsci’s understanding of “hegemony,” a

term he uses to mean both domination and the process of negotiation and consensus-formation in which culture is a site of struggle between accurate and just representations of self and misrepresentations by others. The differences among these theorists, as well as among those who invoke their theories, resides in a conflict over how much credibility one is to ascribe to individual or personal agency, whether none or some.

For those who argue “some,” poststructural insights deriving variously from the writings of Jacques Lacan, Jacques Derrida, Roland Barthes, Michel Foucault, and Julia Kristeva are used to deconstruct and thereby decenter formalist readings of culture that, in alignment with traditional “humanism,” presuppose a “center” (sometimes conceived as an author) that organizes and regulates cultural meaning. Cultural “texts” or “sites” are instead seen as incorporating differing modes of signification (or, according to Mikhail Bakhtin, multiple voices) that conflict with each other, thereby providing a means of dismembering rhetorics that otherwise seek to dominate or control meaning. Thus, reader-response theoreticians argue that consumers’ uses of cultural products become of importance because consumers may appropriate products and refashion them to meet their own personal and group needs.

Folkloristics intersects with cultural studies, as Charles L. Briggs and Amy Shuman note in their 1993 “New Perspectives” issue of *Western Folklore*, when it follows Américo Paredes’ challenges of the 1970s “to place questions of the politics of culture at the heart of the discipline of folklore.” This means, on the one hand, “understanding that folklore is already (in Derrida’s terms) a politics of culture” and, on the other hand, understanding that the discipline of folkloristics is, through its representational practices, also a politics of culture.

Exploring folklore as a politics of culture, Barbara Babcock has explained how Cochiti women “have contrived to tell stories” through their pottery about men’s storytelling, thereby subverting “masculine discursive control” and disturbing “the distribution of [local] power profoundly” (Babcock 1993), while Mark E. Workman has discussed folk-group tropic constructions of self and otherness in relation to differing group and personal responses to AIDS (Workman 1993). Jay Mechling, noting children’s appropriations of television cartoon characters as part of their unstructured play, has exhorted folklorists to explore the ways in which people negotiate private and group readings of popular culture (in Briggs and Shuman 1993), while Susan Davis has argued that such forms of public culture as parades, although frequently used to assert the dominant culture’s ideological agendas, may be used by a subordinate group “as vehicles for protest as well as for historical commemoration” (Davis 1986). John Dorst has described the traditionalizing practices of Chadds Ford, an elite suburb in southeastern Pennsylvania, which in a postmodern turn inscribes and markets itself through “pamphlets, brochures, glossy travel magazines, gallery displays, postcards, tourist snapshots, amateur art, styles of interior decoration, and suburban architecture and landscaping” (Dorst 1989). And José Limón has historicized and localized the study of the social contradictions of race, class, and gender in Mexican American social poetry (Limon 1992).

Disclosing folkloristics as a politics of culture, others have addressed the ways in which the discipline has been, from its early foundation in Romantic nationalism, participatory in the dominant culture’s appropriations of folk culture as a means of enhancing hegemonic ideological agendas. Richard Bauman, for example, has described

the ways in which Henry Rowe Schoolcraft's early 19th-century publications (Schoolcraft has been described as "the Father of American Folklore and Anthropology") appropriated Ojibway narratives for the construction of an "authentic" Anglo American literature by erasing their individual tellers and the particularity of their performance contexts, thereby attributing them collectively to the Ojibway Nation, and by rewriting them to fit better an Anglo European literary aesthetic. In turn, Schoolcraft's publications became the source material for parts of Henry Wadsworth Longfellow's popular poem *The Song of Hiawatha* (1855), one of Longfellow's attempts to create a national American epic. Thus, the production of a hegemonic popular American literary voice (Anglo and male) entailed the appropriation (decontextualization and recontextualization) of a subordinate group's cultural traditions that, through hegemonic representational practices, misrepresented, thereby erasing, individual Ojibway voices (Briggs and Shuman 1993). Similarly, John W. Roberts has argued that folkloristic representational practices participated in the construction of a hegemonic equation between "authentic" African American experience and the traditions of the poor in the rural South, an equation that erased those African American experiences that were urban or middle-to-upper class (in Briggs and Shuman 1993).

Other folklorists (like their anthropological colleagues James Clifford, George E. Marcus, and the other contributors to *Writing Culture: The Poetics and Politics of Ethnography* [1986]) have begun to disclose and reevaluate the scientific essentialism of folkloristic paradigms and methods, both the fallacy of scientific objectivity and the subject-object relations constructed with the discourse of older participant-observation positionings (Collins 1990). We have begun to address not only the disciplinary and broader sociocultural effects of folklorists' participation in the construction (through professional writings, museum displays, and popularized "folk" festivals) of the dominant culture's "quintessential others," the "folk," but also folklorists' participation in the construction of folklore's others—modern, elite, popular, and mass culture as well (Briggs and Shuman 1993; Stewart 1991). And folklorists have begun to evaluate the ways in which the discipline is enmeshed within the socioeconomic politics of its supporting institutions: universities, arts councils, historical societies, and the like (Kirshenblatt-Gimblett 1988).

At a time when anyone's right to represent and thereby construct an "other" is being called into question, folklorists' self-reflexive turns mark a willingness, as Briggs and Shuman have noted, to take responsibility for our discipline by disclosing and evaluating the conceptual problems inherent in our constructions of "folk" culture (Briggs and Shuman 1993). "Meaning," for folklorists who participate in cultural studies' discursive practices, is not situated in a "transhistorical" aesthetics independent of economic, social, or political conditions. It is allied with Louis Althusser's definition of ideology as "lived practice" and, thus, is contextualized by historically specific economic, social, and political conditions and the ways in which these conditions interact at the "local," "larger than local," and global levels.

Curanderos

Folk healers in the Mexican American community. Folk medicine remains important among Mexican Americans throughout the Southwest and beyond. Similar to other folk medical systems, the Mexican American folk medical system consists of three levels: *remedios caseros* (household remedies), *barrio* (neighborhood) healers (including the *partera*, or lay midwife; the *sobador[a]*, or folk chiropractor; and the *yerbera[o]*, or herb specialist—all part-time healers), and the *curandero(a)*, who has received a *don de Dios* (gift from God) to heal the sick. The *curandero(a)* is the only healer in this society who is believed to have the power to heal cases of *brujería* (witchcraft). In addition, the healer is thought to have all of the knowledge about folk healing that those in the two other levels of healing possess.

Some *curanderos* serve local communities, while others serve larger regional communities, and some even the international community. In south Texas, for example, Don Pedrito Jaramillo of Los Olmos, who died in 1907, was widely sought for his services by people from throughout the region and beyond, including some Anglos. El Niño Fidencio of Espinazo, Nuevo León (Mexico), who died in 1938, continues to have a large following of *espirituistas* (spiritualists) throughout the region on both sides of the border. Teresita Urrea of the state of Chihuahua, Mexico, had a very large following in several Mexican states as well as in New Mexico, Arizona, and California.

Some of these healers achieve the status of folk saints—that is, they are treated as though they were saints, though they are not canonized by the Catholic Church. Their photographs appear on home altars throughout the region, and their followers believe that one day the Catholic Church will canonize them, as it has other healers.

The *curandero* is assumed to have a knowledge of medicinal herbs and the skills to treat such folk illness syndromes as *malde ojo* (an illness that is caused by looking at someone or something in excess admiration), *susto* (an illness caused by fright), *empacho* (an illness caused by eating too much raw or very rich foods), *caída de la mollera* (fallen fontanel in infants), and others. Other healers in the culture can deal with these illnesses, but the *curandero*, because of his gift from God, has the power to heal cases of witchcraft, which healers in the other levels cannot treat.

It is not uncommon to find some confusion as to who is a *curandera* and who is a *bruja* (witch). Some clearly understand that the *curandero(a)* can do only good and cannot cause harm, and that the *bruja*, who has made a pact with the devil, can only cause harm, but can do no good. Such confused labeling plays an important role in *Bless Me, Ultima*, the novel by Rudolfo Anaya that explores a young man's understanding of the *curandera*, Ultima, who has come to live with his family in New Mexico.

Because of the conflict with the worldview of the dominant majority, there is a correlation between education, social class, birthplace, and language preference and the acceptance or rejection of certain parts of the folk medical system. The *curandero(a)* level is usually the first to be rejected, in part because it is at greatest variance with the worldview of the macroculture. Recent surveys in south Texas indicate that around 90

percent of the Mexican Americans living in rural areas continue to rely on herbal remedies, and as many as 29 percent of the women have used *parteras* (lay midwives) to assist with childbirth, but belief in and use of *curanderos* has dropped significantly since the 1950s.

Cursing

Offensive, abusive, or opprobrious language used to express anger or to wish harm to another. Cursing and swearing are general terms for colloquial expressions that are differentiated on the basis of a speaker's intention.

Ancient curses were intended to cause harm on the basis of a primitive or magical form of thinking, as if the invocation or curse would come true by saying it, as in *go to hell* or *be damned*. Modern swearing allows speakers to intensify a variety of thoughts and emotions but is most commonly associated with forms of verbal aggression, frustration, anger, or surprise. Cursing is frequent and pervasive in American speech, and it appears in forms of humor, folk stories, rock and roll and rap music, theater, jokes, sex talk, slang, shoptalk, verbal dueling games (the dozens), and sporting events.

In folk language, swearing categories include profanity, blasphemy, epithets, insulting or name calling, ethnic-racial slurs, scatology, and obscenity. Profanities are secular or irreligious uses of sacred words (*holy shit*), while blasphemy is a direct attack on religious figures or thought (*screw the pope*). Epithets are expressions of frustration without targets, as when one hits a thumb with a hammer (*son of a bitch!*). Insults and name calling are words targeted at wrongdoers and are based on animal names (*jackass*), references to deviancy (*queer*), gender-related terms (*slut*), and comments about physical appearance (*lardass*), mental functioning (*retard*), or regional stereotypes (*briar hopper*). Ethnic-racial slurs denote physical, mental, or food-related characteristics of a minority group (*taco bender*). Scatological cursing is based on terms for body parts, products, and processes (*shit*) and is one of the early types of childhood cursing and humor. American obscenities are pointedly sexual (*fuck*) and are subject to censorship.

Cursing is controlled by contextual constraints, such as social-physical setting, speaker-listener relationships and status, intended meaning of the message, and communication channel. Curse words and phrases range from mild euphemisms (*gosh darn*) to explicit sexual referents (*fuck or cunt*) and are mainly based on British English terms, although other foreign terms are borrowed (*schmuck*). Cursing occurs frequently in personal conversations but is censored in print and electronic media through the application of literary or broadcast standards and policies. It can be legally restricted when construed as a form of sexual harassment, fighting words, or obscenity.

Episodes of swearing appear across all age ranges, geographic locations, professions, and economic strata. In public, men swear about twice as much as women, and teenagers more than children or the elderly. Cursing is erroneously thought to be associated with lack of control, education, or vocabulary by those who seek to maintain spoken-language standards. However, cursing follows conventional semantic and syntactic language rules and is based on a logical method of expressing emotional thoughts.

Custom

An activity performed with such regularity that it is considered a custom is the usual way of doing things. Ethnographers record expected behavior or a part of social protocol. Simply put, consider custom part of the daily lives of a particular group of people; folklorists, in practice, consider custom part of the group's folkways and folk beliefs. When they take on the authority of law, customs are often called "mores." Customs such as shaking hands when greeting people, offering a polite "God bless you" when someone sneezes, or "knocking on wood" are found virtually throughout the United States and elsewhere. People learn these and other customs sometimes by word of mouth—that is, the knowledgeable members of the folk group simply tell the uninitiated what is expected in particular situations. Parents play a major role in continuing customs by telling children when and how certain practices are appropriate in particular contexts. At other times, custom is learned by imitation—that is, by repeating the actions of those who are more experienced and familiar with the "way things are done." Being part of a folk group means practicing the customs of the group.

The study of national customs is generally beyond the concern of specific folklore studies. Folklorists instead limit themselves to collecting and analyzing customs maintained within discrete folk groups. For example, the agricultural and religious customs of the Pennsylvania Dutch as well as the customs found among Cajun folk receive considerable attention from folklorists.

A review of the major folklore collections and bibliographies reveals that American folklorists seldom treat "custom" per se, but consider it linked with other genres or with particular folk groups. They may refer broadly, for example, to rural or urban folk customs, or more specifically to religious customs, customs associated with various trades and professions, and children's play customs. The term "folkways" is often used analogously with custom and often refers to rural customs and practices, especially those closely affiliated with agriculture and animal husbandry.

Customs are divided in folklore studies into several categories: those linked (1) to the calendar (practices associated with certain dates or times of the year); (2) to rites of passage (practices associated with important events in the human life cycle); (3) to significant social events (festivals and large group celebrations); and (4) to folk belief (practices that result from holding certain beliefs). The division serves purposes of cataloguing, since rarely do these divisions not overlap.

Folk calendar customs in the United States are not as common as they are in Europe. While many Americans celebrate calendar holidays nationally, such as the Fourth of July or Thanksgiving Day, they maintain regional and familial traditions that distinguish the way in which one group of people commemorates these holidays from the ways of other groups. Although folklorists may not focus their attention on Thanksgiving Day as a national harvest celebration, they research regional and family customs that develop as part of celebrating Thanksgiving. The preparation of unique foods that are served at the Thanksgiving meal, who performs what activities associated with preparing and serving

the meal and cleaning up afterward, when and where the meal is to be served, and so forth are often determined by family custom. Among some folks in rural parts of Vermont, New Hampshire, Maine, and upstate New York, it is a custom on Thanksgiving for the men and boys in an extended family to spend the morning and early afternoon outside deer hunting while the women prepare the traditional meal. In some families, this is the occasion for the younger children in the company of their father, uncles, and

older brothers to make their first hunt. More often than not, no animals are shot this day, thus stressing the social dimension of this Thanksgiving Day custom.

The calendar offers other opportunities for practicing different customs. Vermont gardeners customarily sow vegetable and flower seeds indoors on Town Meeting Day, the first Tuesday of March. Across the nation, school-age youngsters play pranks on their peers on April 1, April Fools' Day. Ringing in the New Year may be replaced by shooting in the New Year among German and Italian Americans. Some U.S. calendar

customs, such as sending Father's Day and Mother's Day cards or giving candy on St. Valentine's Day are supported more by commercial interests than by folk tradition.

Calendar customs that draw upon the coordinated participation of large groups of people are often studied as festivals and celebrations. Native Americans gather annually for national powwows, during which festivals they share, reinvigorate, and revitalize their traditional customs. Many state and national folk festivals are hybrid products of a surging interest in folk traditions and the availability of major funding; they would probably not exist on the scale they do without federal and state support and a large professionally oriented organization behind them.

Rites of passage mark major transitions in the life of an individual, and customs associated with them are important ways for folk groups to recognize the changes. From conception to death, folk groups have produced an enormous number of customs that measure the growth and development of their members. Deciding on the name of a child may be left up to the whim of parents, or family or ethnic custom may dictate that the parents follow the custom of naming the child after an ancestor or relative. The custom of giving the birthday child a punch on the arm for every year of age is common among children throughout the United States. Customarily the tooth fairy trades candy or money for the children's baby teeth when they fall out. Although this tradition may have had ancient roots in

*A page from an autograph album,

superstition, the custom as practiced in most of the United States simply marks the transition of the child into adulthood and promotes a safe and easy way for the parents to dispose of the unwanted teeth. Numerous customs associated with marriage persist in the United States. Among some Mexican Americans, it is customary for a group of the young man's friends to visit the young girl's family to ask permission for the courtship to begin.

Decorating cars after a wedding and parading through the bride and groom's neighborhoods immediately after the wedding ceremony remains a part of some community and ethnic traditions. In some parts of the South and Midwest, the marriage celebration includes the custom of disrupting the newlyweds' first night with a surprise shivaree. Customs associated with death are equally widespread. Some families consider it customary to stop their clocks to mark the time that someone in the house died. In parts of the South, pottery and medicine bottles decorate graves. Large meals held after a funeral customarily celebrate life. Survivors maintain the grave site of relatives and decorate it on the anniversary of their death or for particular calendar celebrations.

Folk festivals provide the opportunity for a large degree of community involvement. The Scottish American Highland Games held annually in New Hampshire provide the opportunity for descendants of Scottish families to celebrate their heritage. The women prepare the customary dishes of Scotland; the children, dressed in kilts, perform the Highland dances; and the men compete in games of testing their strength. Folks in backwater communities of Louisiana celebrate Mardi Gras following old customs unlike those practiced in the massive, more commercialized Mardi Gras celebration in New Orleans. Among many Italian Americans, December 26 is Visiting Day: You customarily leave your front door open, set out drinks on a table near the door, and arrange for viewing the gifts you received on Christmas; then you visit your neighbors' homes, calling on folks who themselves may be out making other visits. The custom provides the opportunity to show your generosity to your friends and to display signs of your own prosperity.

Some customs are closely associated with folk belief, making it sometimes difficult to distinguish custom and ritual. But the two, at least in the abstract, are different. Ritual is usually performed in order to affect the future. Customs, in the abstract, are not practiced to influence the future. To break custom can bring questioning, criticism, or censure from members in the folk community. The practice of dressing a male infant in blue and a female infant in pink party derives from a primitive European belief that the color blue protects infants from harm. While the belief itself generally has died out in the United States, many Americans follow the practice because "that's the way things are done." They are unaware of the customs origin in folk belief, or, if they are aware of it, they do not necessarily subscribe to the belief, but they continue the custom anyway because it is expected of them.

In the broadest sense, much of folklore is itself a part of custom, because folklore is appropriate and oftentimes expected behavior in certain contexts. By custom, an ill person seeks advice from the herb doctor; custom tells the Native American storyteller to wait until winter to tell certain tales; the singer frames the performance of a song with customary opening and closing formulas. While remedies, tales, and songs are not necessarily considered customs, the practice of each may be decided by folk custom.

As folklorists look at folk traditions in the work place, they discover a whole range of customs. Richard M. Dorson's research among lumberjacks in the Upper Peninsula of Michigan discerned a code of behavior that prescribed a number of customs. For example, the jack, after spending months in the woods, was by custom expected never to walk away from a fight, to be courteous toward women, and to spend all of his wages on drinks for himself and his fellow lumberjacks. Lumberjacks also hold their own carnivals at which they customarily compete in various games that demonstrate their logging skills.

In other occupations, custom dictates a hierarchy on the assembly line, with new workers often expected to do the unpleasant tasks. The customary coffee break provides both white- and blue-collar workers with a time for gossip, sharing stories, and playing practical jokes. In this context, too, new workers learn more about the social and work protocols expected of them.

Determining when a traditional craft should be undertaken may also be bound with custom. In some regions of the United States, it is a custom for a young girl to complete her first quilt—usually a doll-sized one—before reaching puberty. The finished quilt is stored in her hope chest until she marries, and eventually it is used to bundle her first child.

Families may have their own customs, such as parents sitting at the head of the table at main meals or the youngest child opening the first gift on Christmas morning. Eating the main meal in the early afternoon on Sundays is by custom different from the practice during the week, when the main meal is served in the evening. Among Vermonters who tap their own maple trees and boil their own syrup, it is a custom to celebrate the first of the family's maple-sugar crop by using it to make sugar-on-snow, which is customarily served with dill pickles and plain doughnuts.

The study of folk custom has not developed per se as strongly in American folklore scholarship as it has in Europe, but with the increasing interest in folklife studies, more attention will be given to custom.

Dance, Folk

Stylized movements of individuals, couples, or larger groups in traditional patterns, usually performed to musical accompaniment. In modern folkloristics, dance is generally understood as a panhuman but nonuniversal type of structured movement system involving the creative use of the human body in time and space in a manner that formalizes and intensifies kinesthetic experience and communication through culturally distinct idioms distinguished as such within particular societies. This is a perspective developed by such anthropology-of-dance theorists as Adrienne Kaeppler and Drid Williams. The adjective “folk” is applicable to any dance idiom transmitted through traditional processes, but the term “folk dance” is identified most closely with dances thought to express group identity, especially those idioms with a history of rural, peasant practice seen to represent ethnic and national identities.

Folk dance has a variety of manifestations: It can be found as an unselfconscious practice of vernacular forms, or it may appear as elaborately choreographed and staged representations of such forms; it may also be practiced as a more or less formally organized recreational activity. “Popular” dance forms—social dances of more recent provenance and associated with mass-mediated modes of transmission—are often contrasted with folk forms, even though popular dances are clearly traditional in their transmission and varied in their practice. The term “vernacular” dance is gaining acceptance as a more inclusive term that situates a dance practice among nonprofessionals in community settings, as characterized by Susan Elke Spalding and Jane Harris Woodside in *Communities in Motion* (1995).

The term “folk dance” achieved currency late in the 19th century in comparison with other folklore genres, being considered then as a lesser aspect of folk custom. The connotations of the term are closely related to the study of traditional vernacular dance forms in Europe. Its particular connotations, popular associations, and uses, however, vary widely in relation to circumstances in different countries. In the United States and Canada, “folk dance” is often associated, and sometimes conflated, with terms such as “ethnic,” “popular,” “traditional,” and “vernacular”; indeed, folklorists have turned their attention to all of these phenomena. Not surprisingly, given its tangled history and diverse manifestations, many dance researchers have turned away from the generic term “folk dance,” choosing instead to consider their subject matter more broadly; dance idioms move easily between various cultural strata, and it makes little sense to draw these boundaries too firmly.

Many definitions emphasize, as did that of Gertrude Kurath, a key figure in American dance research, its communal nature, magico-religious function, and connection with “life’s crucial cycles.” Such characterizations invoke conceptions of folklore as a survival of hypothesized earlier stages of cultural evolution or of particular historical periods and Romantic nationalist concepts of the spirit of a people located in imagined anonymous communal expressions. To some degree, these concepts persist and inform folk-dance study, particularly among those who carry on its “revival”—that is, the selfconscious practice of folk forms in recreational and representational contexts.

As folklorists reconceptualized their subject matter later in the 20th century, emphasizing its functions in culture, folk dance, too, was redefined. Alan Lomax attempted to relate various measures of dance-movement characteristics to broad features of cultural history on a worldwide scale in his “choreometrics” project (Lomax 1968). Joann Wheeler Kealiinohomoku, as part of her effort to influence the study of dance from an anthropological perspective, emphasized the vernacular character of folk dance, thus subsuming social and popular dance forms while excluding “art” and “classical” forms, and further specifying that folk dance include both “first and second existence” practice. This distinction she took from Felix Hoerburger, who adapted these terms to distinguish dance that has an “integral part in the life of a community” from that which is no longer “functional” but is rather the property of “a few interested people.” Folk-dance study,

Hoerburger argued, was often necessarily concerned with the latter, particularly in America where first-existence dance was, he believed, practically nonexistent.

Hoerburger thought firstexistence dance to be the field of folklore research; secondexistence, that of "cultivation." Most took his distinction to imply a devaluation of second-existence practices and to suggest that researchers cleave to what little first-existence material they could find. Similarly, until recently in America, folkloristic perspectives have been most often brought to bear on vernacular dance idioms, both traditional and popular, often mass-mediated forms, and only somewhat grudgingly on the "second-existence" practices of recreational clubs and theatrical presentation, and then usually as an occasion for criticism. These latter phenomena have recently been somewhat rehabilitated as the study of "folklorism" has been articulated in its own terms and become more acceptable.

Given the somewhat discontinuous assortment of dance practices brought together by the history of folkloristics, we might better characterize folk-dance study by its research perspectives than by its subject matter. Folk-dance research methods include dance collection and analysis of form and structure, usually applied in order to classify and trace patterns of diffusion and change. These techniques, highly developed in Europe, had an influence in America as well, but were generally not applied here as systematically. The technically phisticated system of Labanotation, for example, which widely adopted in Europe, is rare in American publications, where notation is primarily provided only for use by teachers in educational and recreational settings. Indeed, almost all American collections of this type lack even basic scholarly apparatus. Contemporary researchers, such as Lee Ellen Friedland, have reviewed the unpublished papers of collectors to glean information about their methods and to render their works more useful. Methods for the documentation and analysis of dance events, propounded by American dance ethnologists in the 1970s in works such as *New Dimensions in Dance Research: Anthropology and Dance* (1974), edited by Tamara Comstock for the Committee on Research in Dance, were subsequently employed in many folk-dance studies. Analysis of dance *events* rather than merely *dances* serves both to situate dancing within a particular cultural system and to focus attention on the communicative processes enacted in dance performance.

Despite confusion over the precise application and scope of the term, "folk dance" in America certainly includes the dances of many cultural traditions, including those identified with the early Anglo American settlers (sometimes presented as "the" American folk dance), some African American dance idioms, and the dance traditions of immigrant groups, particularly Europeans. Perhaps less popularly conceived as "folk," but equally treated by folklorists in the late 20th century, are vernacular popular idioms of social dance among the numerous so- subcultural groups in our diverse society. Even these groupwas ings cannot be made too distinct, however, for if American folk dance is characterized by anything, it is the interaction of many different cultural streams. It is not possible here to compile, much less fully explore, a complete accounting of folk dance in America; rather, this survey characterizes some general features of dance practice, with a focus on dance forms of particular interest and importance in the history of folk-dance study.

In purely choreographic terms, one can identify several systems of expressive-movement resources in use among American folk dances. The disposition of dancers in space, their arrangement in various formations, often called "sets," and their subsequent movement in relation to one another, traveling particular paths from place to place within

these sets, in patterns often called “figures,” constitutes one significant domain of movement articulation and a resource, deriving primarily from the northern and western European dance heritage brought to the New World by several groups of settlers, on which dancers have drawn in the process of reconfiguring their dance traditions to meet changing circumstances. The more dance-like of childrens’ singing games and the adult play-parties practiced in communities where religion forbade “dancing” generally fall into this category.

The similarity of some square-dance figures to those of childrens’ games led some to see these dances as survivals of “ancient fertility rites.” In the late 20th century, it seems more reasonable to consider these common figures as particular manifestations of an underlying structural aspect of western European dance-movement systems. Although dancers may move through figures as individuals, the basic building block of the dance set is usually the mixed-sex couple; couple dancing is, of course, one of the most widespread European structural forms. Dances in which men and women move together performing movement sequences that articulate their relationship to one another, usually holding one another, or moving around each other in various ways, sometimes facing, sometimes side by side, at times far apart, and at times close together, have been a rich resource in the development of American vernacular dance, particularly in interaction with African American movement concepts. Finally, the structuring of dance movement in fixed sequences of footwork, or steps, is also a common European movement structure. It coexists and combines with other structuring principles, such as the spatial organization of dancers, in various ways in particular idioms. As in couple dancing, “step” dancing (understood as the articulation of rhythm by the feet) has been a movement idiom in which European and African cultural streams have produced a fruitful confluence. The “line dancing” usually performed to country music, documented in Betty Casey’s *Dances across Texas* (1985) is a good example of such an amalgamation of different structuring principles in a popular social dance idiom.

One genre of figure dance, the square dance, is perhaps the most studied of American folk-dance forms. It is, in fact, a whole complex of related forms and events, a source of confusion since a square-dance event may include performances of other dances. The square dance is generally associated with Anglo American settlers and has often been treated as the quintessentially “American” folk dance. The identification of the square dance, particularly that typical of the Southeastern American states, as an isolated, rural survival of ancient English dance forms is attributable to Cecil Sharp and his influential publication of *The Country Dance Book Part V: The Running Set* (1918), collected in Kentucky, and the successful work of the American Folk Dance Society that he founded—which continues as the Country Dance and Song Society—in promoting his agenda for dance revival. This dance, on the contrary, has been shown to have been but one example of an American circular-formation figure dance reflecting the shared European heritage of the settlers of the southern Appalachians who created and perpetuated it. The dance is performed by a small number of couples, usually from four to six, in small kitchens typical of its informal performance, well into the 20th century. The couples are arranged in a circle, and the dance has two parts: group figures for the entire set, such as circling in a ring or exchanging partners around the set in various patterns, which alternate with two-couple figures performed successively as one couple travels around the set performing figures with each of the other couples in turn. These

figures are of several types and are composed of such movements as turning, or swinging, one's partner or one's "opposite"; one couple tracing a figure eight or other pattern as they dance around the other couple, who stand relatively still; or dancing around one another, while turning under each other's arms in various patterns without letting go of each others' hands.

Many such figures were collected and published in literally hundreds of instructional square-dance books; unfortunately, for scholarly purposes, very few of these collections were adequately documented. Some study of the distribution of figures has nevertheless been attempted, but the diffusionary picture has probably been muddied beyond recovery by the overlay of subsequent dance developments. Comparison with documentation of other far-flung but related dance traditions, such as the one described by Colin Quigley in *Close to the Floor: Folk Dance in Newfoundland* (1985), shows this figure dance form to be widespread.

In the Northeastern states, in a milieu documented by Elizabeth Aldrich in *From the Ballroom to Hell* (1991), continuing interaction of rural practice with popular dance forms of the urban ballrooms, such as the longways country dance and the quadrille, resulted in a genuinely "square" formation dance for four couples. They performed rather different figures in facing pairs; these usually involve crossing the set or exchanging partners in various ways. These dances retained their popularity in rural New England and have become a resource for several revivals in the 20th century.

Elizabeth Burchenal in 1917 published *American Country Dances from New England*. She was the most influential pioneer of the "international" folk-dance movement of that period in the United States, publishing many national collections for use in educational and recreational contexts. Henry Ford drew on this material in his campaign to promote oldtime dancing in the 1920s. Ralph Page promoted the New England "contra" dance, a figure dance performed in longways formation—that is, by lines of men and women facing each other "up and down the hall," as the dance callers would say. So-called longways country dances "for as many as will" were

perhaps the most popular social dance form of the colonial era, and the formation retained its popularity into the 20th century in parts of New Hampshire and Vermont, an environment evoked in Beth Tolman and Ralph Page's *The Country Dance Book* (1937). Contra dancing again became the focus of a revival movement in the 1960s and 1970s, this time associated with the counterculture and "back-to-the-land" attitudes of that era. Its practice has spread across the United States and overseas, joining the ranks of other loosely networked affinity groups that have coalesced around folk-dance idioms.

The Southeastern and Northeastern square-dance traditions seem to have interacted during westward migrations to generate the traditional Western square dance, a hybrid form utilizing a four-couple set along with a succession of twocouple figures. In the 1930s, Lloyd Shaw was a key figure in the development of modern Western square dancing, responsible for many innovations as he worked with teams of exhibition dancers, publishing descriptions in his 1939 book *Cowboy Dances*. Since the 1950s, square dancing has developed an increasingly standardized and complex repertoire of figures through an organized nationwide network of recreational clubs, distinct from the older regional traditions. It is these groups that launched, in the 1980s, a legislative campaign to have the square dance declared the "national American folk dance," harking back in their arguments to the oldest concepts of "folk" as national expression. The response of the professional folklore community was unanimous in opposition. The counterarguments and range of examples brought forward suggest the scope of what might reasonably be considered American folk dance. African American tap dancers,

Hispanic *folklorico* organizers, Lindy Hoppers, Swing dancers, and Native Americans, among others, testified that their dance traditions were not represented by “square dancing,” and that no matter how *American* that form indeed might be, as an expressive form resulting from a particular history it could not represent all American histories.

Among the histories of these “other” Americans to be found in folk dance, that of the African Americans looms particularly large. It is well covered in Lynne Emery’s *Black Dance from 1619 to Today* (1988). The conditions of slavery in the United States, of course, were not conducive to the perpetuation of African cultural forms. African religion with its incorporation of music and dance was particularly repressed, but American slaves perpetuated the spirit of African sacred dance under the guise of Protestantism in the form of the “shout.” Often performed as a ring, but also found as individual religious expression, the shout is marked by a shuffling step in which legs were not crossed and heels did not leave the floor. At the same time individual dancers expressed themselves freely in a wide range of body movement and vocalization performed with a clapped and sung accompaniment. Practiced at religious meetings in the Deep South, it built up tremendous energy during the course of a night’s performance.

The context of slavery and subsequent African American life in the Caribbean was quite different, allowing for more continuity with African practice. In this region, dance is an integral part of such hybrid religious systems as *santeria* and *vodoun*, in which divine spirits “mount” participants and identify themselves through distinctive dance movements. Pioneer researcher and influential African American dancer Katherine Dunham did much to draw attention to these traditions in works such as *Dances of Haiti* ([1947] 1983). In some places, European figure dancing was adapted into these African American expressive-movement systems, as described in Jay Dobbin’s *The Jombee Dance of Montserrat: A Study of Trance Ritual in the West Indies* (1986). The African American experience is also well represented in the secular realm of games, plays, and dances, such as those recorded by Bess Lomax Hawes from Georgia Sea Islander Bessie Jones in her collection *Step It Down* (1972). In general, African dance traditions in America were radically reconfigured in response to oppression, through processes described by Roger D. Abrahams in *Singing the Master: The Emergence of African American Culture in the Plantation South* (1992). Paradoxically, however, certain aspects of the African movement resources have come to permeate American vernacular popular dance. *Jookin’: The Rise of Social Dance Formations in African-American Culture* (1990) by Katrina Hazzard-Gordon and *Jazz Dance: The Story of American Vernacular Dance* by Marshall and Jean Stearns (rev. ed. 1994) explore this history in detail. Contemporary African American urban dance idioms move quickly between the vernacular social dance contexts of the streets, mass-media projections that have a global reach, and back again into local practice. “Popular Dance in Black America,” a 1983 special issue of the *Dance Research Journal of the Congress on Research in Dance*, provides a good introduction to this subject.

The European and African dance-movement cultures that met in America were quite different. The European forms—articulated in spatial patterns and fixed step patterns, performed in an erect, uplifted posture with little torso articulation—contrast fundamentally with the bent posture and grounded focus of the West African idioms, in which individual improvisation on basic movement motifs, and groupsoloist interactions, contrast with the paired male-female organization of European couple and figure dances.

These two systems combined in the domain of popular entertainment and social dance to produce many American vernacular forms, including tap dancing in several guises and an endless stream of couple-dance forms from the turn of the 20th century—the cakewalk, through the later Charleston, Lindy Hop, and jitterbug—into the era of unattached-partner dances such as the twist, disco, and subsequent “rock” styles.

Tap dance is one, albeit itself diverse, genre of percussive step dancing. As suggested above, this dance idiom is one in which African and European elements intermingled firely, moving as well easily and frequently through popular, traditional, social, and theatrical contexts. Folklorists have generally been most interested in its vernacular social manifestations, Mike Seeger and Ruth Pershing’s *Talking Feet* (1992) providing die best overview of its southern Appalachian manifestations as clogging, flatfoot, and buck dancing. More detailed folkloristic studies of particular dancers and their communities have explored the meanings attached to the contrastive styles suggested by these different terms. Like the square dance, with which stepping may be combined in different ways, this dance idiom has also been strongly associated with Appalachian identity and developed as an exhibition form. *Communities in Motion* (1995), edited by Susan Elke Spalding and Jane Harris Woodside, provides a comprehensive treatment of the dynamics of vernacular dance traditions in the American Southeast. Its articles reach beyond an isolated view of the region or a segregated treatment of Black, White, and Native American traditions to suggest the complexity of community interaction at work in these dance traditions. While Native American dance is outside the consideration of this encyclopedia, it should be noted that dance moves across this cultural border as well—a process explored in depth in Craig Mishler’s *The Crooked Stovepipe: Athapaskan Fiddle Music and Square Dancing in Northeast Alaska and Northwest Canada* (1993).

When considering the European dance heritage in America it is important to note that this tradition includes much besides the ideologically dominant discourse of Anglo American heritage. The French have long been settled in North America and, indeed, remain a majority in Quebec and a significant minority elsewhere in the Canadian Maritimes and parts of Louisiana, where a distinctive Cajun regional culture has evolved. French dance tradition in the Northeast, based on the figure-dance quadrille, cotillion, and country (or contra) dance forms, is most thoroughly described in Simon Voyer’s *La danse traditionnelle dans l’est du Canada: Quadrilles et Cotillons* (1986). Clearly the dances of the French shared much with those of die Scots, Irish, and English among whom they lived, and mutual borrowing and adaptation produced a distinctive French Canadian amalgam. The Quebecois separatist movement inspired a surge of interest in French tradition, which found expression in exhibition ensembles, mentioned in Richard Handler’s *Nationalism and the Politics of Culture in Quebec* (1988). Among the Cajuns in Louisiana, contact and exchange with African American culture has produced a couple-dance idiom in waltz and two-step rhythms emphasizing improvisation, strongly influenced by mid-20thcentury vernacular couple-dance forms. Cajun dance has become fashionable as a genre of recreational social dance practiced nationally within the framework of its own networked affinity group. While Cajun music is well documented, dance is represented only in less formal publications, such as Jerry Duke’s *Dances of the Cajuns* (1987).

Spanish American folk-dance culture, reflecting another early European presence in America, is strong in the Southwest and has remained distinct despite its many shared

features. The incorporation of some widespread features of European ceremonial-dance forms carried by the Spanish settlers and missionaries into religious contexts in this region's tricultural milieu has received the most scholarly attention. Flavia Champe describes in *The Matachines Dance of the Upper Rio Grande* (1983) examples of a dance complex found among both Spanish and Indian communities throughout the U.S. southwest and northern Mexico. Practiced as a Christmas or Saint's Day observation, the dance is part of a dramatic enactment. It employs a double file of men in costume who perform weaving and "combat" figures common in the historical European matachine dances, along with accompanying clowns, both threatening and humorous, and other characters. Once seen as an example of acculturation resulting from Spanish domination, recent research explores the degree to which the matachines dance has been incorporated into Native American traditional formats of movement expression. Spanish American secular social dance traditions employ both 19th-century figure- and couple-dance forms, but they are not much documented in vernacular practice apart from the influence of the *folklorico* movement, which employs primarily Mexican dance forms to represent Mexican American identity. In the 1990s, research is under way on such urban vernacular popular dance forms as the *quebradita*, a modernization of traditional couple dancing closely associated with chicano youth in Southern California. Latin American popular dance idioms, themselves often African influenced, are common in contemporary social dance. Marta Savigliano's *Tango and the Political Economy of Passion* (1995) treats the international history and complex cultural transformations of one such genre.

Specific European dance traditions are found in many regions of the United States and Canada where immigration patterns have led to ethnic concentrations. Polka music and dance, for example, are widespread, with significant centers of activity in Milwaukee, Chicago, and Buffalo, New York. Derived from central European couple dancing and processed through 19th-century ballroom practice, the polka was reclaimed and reinvigorated among 20th-century American immigrant communities as a working-class expression and later marketed as a musical commodity. It is maintained as both a vernacular community expression, open to many influences from 20th-century popular couple dancing, and as a networked affinity-group practice more concerned to maintain a distinct polka tradition. As with many musical-dance idioms, polka-music culture has been better documented than the dance, but much can be gleaned from sources such as Charles Keil's *Polka Happiness* (1992).

In Canada, where the action of an ethnic "melting pot" ideology was less pronounced, the dance traditions of European groups, such as the Ukrainians of the prairie provinces, are firmly entrenched. These have gone through several stages of development in the New World and exist in several distinct contexts explored in Andrei Nahachewsky's detailed study of *The Kolomyika: Change and Diversity in Canadian Ukrainian Dance* (1991). He identifies distinctive types of *kolomyika*, often paralleled among other European ethnic-community dance traditions in America: early social, national, childrens', spectacular, and contemporary social manifestations. We might add to this list recreational "international folk dance" adaptations. The interactions among such different contexts is a central issue in understanding the contemporary practice of European folk dance in particular. Elsie Dunin is one of the few scholars to have addressed her work to these issues in detail in relation to a particular immigrant community, South Slavs in California, where vernacular social dance events are intergenerational affairs in which

different repertoires and dance styles are constantly negotiated among the participants. While this is a largely unregulated process occurring in the immigrant community, Irish dance in America on the other hand, is dominated by control exercised through a system of dance competitions, *claled feis*, and dance-teacher certification, run by an Irish Commission. Such organized and codified Irish dancing has largely supplanted informal vernacular practice.

The dance traditions of Asian immigrants have been even less studied. Brought into folkloristics generally through their “ethnic” associations, some of these are religious in character, such as the Japanese Buddhist *bon odori* dance introduced in California in the 1940s, a communal dance of celebration now widely practiced by Buddhist congregations throughout the United States. Another example is the performances of Korean female shamans, sometimes for ritual, sometimes for ethnic display. Other Asian American dances are derived from “classical” court forms, such as Indian Bharata Natyam, widely taught to young women among South Asians in the United States and Canada, or the Cambodian court dance preserved by refugee artists in the United States. A few such dances are emerging hybrid vernacular forms, such as that danced to *bhangra*, a genre of world music that originated in England and is recorded internationally and “mixed” by disc jockeys for social occasions among young, usually second- and third-generation, South Asians.

Dance remains one of the least systematically studied forms of folk expression in America. This lamentable situation is changing, however, with the increasing availability of new technologies to aid documentation and the growing recognition of the dancing body as a significant site of knowledge, power, and expression susceptible to analysis. As researchers acknowledge “folk dance” in its limited sense as only one domain of cultural production amenable to folkloristic approaches, and as they look beyond it to encompass the tremendous vitality of dance practice in America, the future of dance studies looks to be exciting.

Davidson, Levette Jay (1894–1957)

American folklorist and university professor. Levette (accent on the first syllable) Davidson was associated with the University of Denver from 1922 to 1957, and during this thirtyfive-year tenure he led a productive life as a teacher, an administrator, and a scholar. He died of cancer in the spring of 1957.

Born in Eureka, Illinois, Davidson earned his A.B. degree from Eureka College in 1915, two AM. degrees from the University of Illinois in 1916 and Harvard University in 1917, and his Ph.D. degree from the University of Michigan in 1922. He was a member of Phi Beta Kappa.

In 1922 he joined the English faculty of the University of Denver, becoming a full professor in 1929, beginning his long tenure as chair in 1940, serving as acting chancellor of the university in 1953, then returning to his departmental duties and continuing to direct the Western Folklore Conference, a responsibility he held for a decade and a half. This annual series of meetings attracted scholars and artists of the first magnitude, including Wilson O.Clough, LeRoy Hafen, Marjorie Kimmerle, Harold G.Merriam, Louise Pound, Frank Waters, S.I.Hayakawa, John Jacob Niles, Archer Taylor, and many others.

Davidson was member of the Modern Language Association, the American Dialect Society, and other professional organizations. The author of many books and articles, Davidson is remembered especially for his *Literature of the Rocky Mountain West, 1803–1903* (with Prudence Bostwick) (1939); *Rocky Mountain Tales* (with Forrester Blake) (1947); and *Guide to American Folklore* (1951). This last work was one of the earliest and most useful systematic approaches to the collection and interpretation of American folklore and retained that distinction until 1968.

When Arthur Leon Campa and John Greenway were brought into his program, Davidson made the University of Denver one of the national centers for the study of American folklore.

Davis, Arthur Kyle, Jr. (1897–1972)

Folk ballad and Victorian-literature scholar. He was born in Petersburg, Virginia, and received his B.A. from the University of Virginia in 1917. He completed his Ph.D. in literature there in 1924 and was a Rhodes Scholar at Baliol College, Oxford. He joined the English department at Virginia in 1924 and became a protege of Professor C.Alphonso Smith, who had founded the Virginia Folklore Society in 1913 and

encouraged its members to collect folksongs. When Smith died in 1924, Davis became president of the society and began editing the Child ballads in its holdings.

In 1929 he published *Traditional Ballads of Virginia*, which included more than 400 versions of 150 Child ballads with meticulous notes and annotations. It was heralded for its scholarship and for demonstrating the continued existence of a performed-Child-ballad tradition in America. In his career at Virginia, he instituted a folklore curriculum, presided over the Virginia Folklore Society, and published two more books of Virginia folksong materials, *Folksongs of Virginia* in 1949 (an index of the society's nonballad materials with no texts) and *More Traditional Ballads of Virginia* in 1960 (50 further Child canon texts). He was assisted on the latter by Paul Clayton Worthington, who, as Paul Clayton, sang a number of the Virginia ballads on recordings for Folkways Records and other labels in the early 1960s. Davis was the Virginia representative to the *Dictionary of American Popular Beliefs and Superstition* and also did research on the letters and papers of the English poet Matthew Arnold. He died in Charlottesville, Virginia, in 1972.

Thomas E. Barden

Deaf Folklore

Term coined in 1977 for the folklore shared by a unique minority of people with hearing loss in their linguistic and cultural community. Folklore includes stories, jokes, riddles, anecdotes, beliefs, games, and other genres traditionally passed from one person to another or from one generation to the next by "word of mouth." However, in the Deaf Community—or "Deaf World"—folklore is combined inextricably with the traditional transmission "by sign of hands."

There are approximately two million deaf people in the United States, and about 450,000 minimally interact among themselves inside the core of the Deaf Community. In the past, some psychologists, physicians, sociologists, and other researchers viewed deafness as a pathological or a medical disability. However, in the late 20th century, deaf people portray deafness as a strongly cultural phenomenon; they do not regard themselves as a category of specially disabled persons. They argue that they feel fine and can do anything except hear. Their deafness is often called an "invisible physical handicap," in contrast to the obvious presence of blind people with their guide dogs and white canes, amputees with missing limb parts, and paraplegics moving on wheels anywhere in public.

The salient features of deaf culture that has been traditionally passed on for many years are: American Sign Language (ASL); deaf clubs and local, state, and national associations of the deaf; newsletters, magazines, and newspapers for the deaf and books about notable deaf people; videotapes of storytellers for deaf children and adults; strong endogamous marriages among deaf partners; community theaters and the National Theater of the Deaf; local and national sports tournaments and the World Summer and Winter Games for the Deaf; residential schools for the deaf and Gallaudet University in Washington, DC, and the National Technical Institute for the Deaf in Rochester, New

York; assistive devices, including baby-cry signalers, flashing and/or vibrating alarm clocks, doorbells, and phones, hearing dogs, TV closed-captioners, and teletext phone devices.

There are more than 200 deaf clubs in the United States; people attend mostly on weekends for social life, business meetings, workshops or lectures, watching captioned films, playing games, seeking mates, exchanging gossip, celebrating holidays, and telling public and private stories and jokes. Also, many deaf clubs sponsor teams or events in bowling, softball, racquetball, basketball, touch football, and golf in which members participate once or twice a week. Often, more than one deaf club exists in a large city; for instance, there are three clubs in Washington, DC, two clubs in Philadelphia, and more than thirty-five clubs in metropolitan New York City. This indicates the cultural diversity of people with different personal, educational, and occupational backgrounds in the Deaf Community.

As part of this cultural diversity, there are *signers*, who use sign language, finger spelling and gestures; and *oralists*, who don't use sign language but speak and lipread. Some people are born deaf, while others are born hearing and become deaf later. Common causes of deafness are childhood diseases (measles, mumps, scarlet fever, and the like), heredity, birth defects, physical injury, or exposure to excessive noise. Some deaf individuals attend residential schools for the deaf; others go to mainstreamed public schools or special day-schools. Ninety percent of deaf people have hearing parents. The deaf children of deaf parents carry the core of deaf culture since it is inheritedly transmitted from one generation of deaf individuals to another. Furthermore, 95 percent of deaf people tend to marry other deaf partners, and about 10 percent of deaf parents have deaf children.

Also in the Deaf Community are other groups of people with a minimal degree of hearing loss. These include hearingimpaired people who can use their residual hearing through amplification to such degree that they are able to carry on oral communication with a minimum of difficulty. Another group includes deafened persons who have functioned in the hearing world for many years before they lose their hearing through aging, accident, war, heredity, or illness and continue to do so afterward.

Many deaf Americans use ASL. Different from the spoken English language, it is a strongly visual, intricately structured and autonomous language with its own vocabulary, syntax, grammar, and idioms. Hand and arm movements, facial expression, and body positions make up the grammar of ASL. Like other languages, ASL has various regional dialects across the United States.

A "universal sign language" does not exist among deaf people around the world, but there is great diversity of national sign languages, just as there are different spoken languages. There are at least 100 different national sign-language dictionaries; however, through frequent personal contacts, deaf people from different countries are able to understand one another through the use of International Signs or "Gestuno" at the World Congresses of the Deaf and the World Games for the Deaf, as well as at other international conferences or events.

Deaf folklore includes deaf jokes, anecdotes, riddles, signlore (sign play including manual alphabet and numbers stories, sign poetry, "catch" sign riddles, sign puns, name signs, and many other forms), personal-experience narratives, games, and lore about notable deaf persons. Some individuals collect deaf cartoons, which depict deaf

characters or comment on some attribute of hearing loss; deaf cartoons have appeared in both deaf and hearing publications. All of these genres depict the strong revelation of deaf culture and heritage that stimulate deaf children's and adults' pride in their own identity.

In general, the common sites of storytelling transmission throughout the nation have been the networks of residential schools and colleges for the deaf, deaf clubs, homes with deaf families, camps, parties and picnics, athletic events, fraternal and political associations of the deaf's conventions and banquets, deaf friends' houses, and work places with deaf coworkers.

A sample of a typical deaf jokes told in the Deaf Community is this one: A lumberjack walked into a forest, went to a tree, and started to cut it down with his ax. When the tree was ready to fall he yelled, "Timber!" and the tree came crashing down. He did the same thing with a second tree. Then he started to cut down a third tree, but when he yelled, "Timber!" the tree did not fall. The lumberjack was perplexed. He cut some more and yelled, "Timber!" again. Still no success; the tree remained standing. He tried once more but he had no luck, so he decided to phone a tree surgeon to come and check the tree. After his diagnosis, the tree surgeon told the lumberjack, "The tree is deaf." The man then knew what to do, and he asked the doctor to move aside. Facing the tree, the lumberjack started to finger spell "T-I-M-B-E-R!" to it. Sure enough, when he finished the word, the tree came crashing down!

The following example demonstrates how deaf characters in jokes or anecdotes frequently tend to find a way to solve a problem in the hearing world: After being married, a young man and woman started to drive their car on their long honeymoon trip. They drove all day until, very late at night, they felt tired and stopped at a motel. Exhausted, the wife fell onto a bed and immediately fell asleep. But the husband was thirsty, so he went out to find a soda machine. He was on his way back to his room when he realized that he had forgotten the room number. He was confused by all of the similar motel doors down the hallway, and he pondered how to get back to his room. Then he got an idea; he walked to his car and blew the horn several times. The lights went on in all of the motel rooms except one, and, thus, he found his own room because his wife could not hear the horn.

In typical signlore or sign play, signers creatively combine hand shapes and movements to create twisted signs or sign puns and other humorous changes of words, sometimes as a part of supposed IQ tests. For instance, in a typical sign pun, the combination of a closed fist resting on the forehead and a snappy opening of the forefinger upward means that one understands, but if the little finger is flipped it means one understands a little. Another sign pun for the word "understand" is this: the combination of a left open palm facing downward in front of one's body and the movement of two straight fingers (forefinger and middle finger) of the right hand touching beneath the left palm. It refers to the word: "under" and "stand" (two fingers designate for a person to stand). Thus, it also denotes "understand," but in a completely different way. Signers have invented humorous name signs for presidents, including Nixon, Carter, Ford, and Reagan. For example, one formerly signed the "N" hand shape alongside one's nose, denoting Nixon's long nose bridge, but after the Watergate crisis one moved the same hand shape across his or her chin, denoting a "liar!" For President Ford, one places the "F" hand shape on the forehead, denoting Ford's Band-Aid on his

forehead resulting from bad falls. As for President Reagan, one places the “R” hand shape over one’s head, depicting Reagan’s hairdo, or both the “R” hand shapes rub together, denoting his being a former movie star. A new sign for him was invented after Reagan was shot. The sign was the tip of the “R” hand shape touching one’s side, indicating where the president was shot. Moreover, there are variations of the popular “I love you” sign (both the middle finger and the third finger closed to the palm with the thumb, forefinger, and little finger open in front to a viewer). This combined sign indicates the “I” with the little finger, “L” with both the forefinger and the thumb, and “Y” with the thumb and the little finger. Two humorous examples are: when one uses the combined sign of ILY and rotates only the forefinger in midair, it refers to “I always love you”; and when one flicks the forefinger tip several times with his or her facial expression (one eyebrow lifts up with the question mark on the face), it means “Do you love me?” Historically, this ILY sign probably dates back to 1895 or possibly earlier.

A typical riddle reflecting the topic of deafness is this: Ten blackbirds were sitting on a telephone line; a hunter came and shot at them. Nine flew off and one stayed. Why? Answer: Nine blackbirds were hearing; one was deaf. Another example is: A riddler asks, “Why do deaf people make the best lovers?” Answer: They can’t say no in the dark.

Deaf people tell legends about notable deaf people, such as Dummy Hoy, a celebrated deaf baseball pitcher who invented the umpire signs, and Deaf Erastus Smith of Texas, General Sam Houston’s chief scout and spy. The legends also cover some hearing individuals who involved themselves with deaf people, such as children of deaf parents or teachers at schools for the deaf or at Gallaudet University. The late FBI Director J. Edgar Hoover is sometimes said to have had deaf parents and to have known sign language, but no evidence supports this claim.

Another popular national deaf legend is about the supposed finger-spelled “A” and “L” hand shapes on the statue of Abraham Lincoln at the Lincoln Memorial site in Washington, DC. Deaf people feel inspired with the revelation of this symbol because Lincoln signed the charter in 1894 to establish a new deaf college, now Gallaudet University in Washington, DC. The Lincoln statue was created by the celebrated hearing sculptor Daniel French, who had finished the statue of Gallaudet, the founder of the first school for the deaf in Hartford, Connecticut, and of Alice Cogswell, the first deaf pupil of Gallaudet. But evidence does not exist in any of French’s personal diaries that he purposely sculpted the fingerspelling hands of Lincoln after having become familiar with the manual alphabet of deaf people when he worked on the Gallaudet statue. Deaf people keep spreading this legendary story among young and old deaf individuals throughout the country in order to express pride about the supposed subtle example of finger spelling and to commemorate the involvement of notable hearing people with deaf people.

Some negative stories told by deaf individuals tend to criticize the hearing world, as in this personal-experience narrative: Two young deaf men were conversing in sign language on a public bus. An awestruck stranger sitting behind them wrote a note asking, “Can you read?” One of the deaf men, disgusted at this question, took out an expensive pen and wrote on the note: “No, I can’t, but can you write?” Another powerful negative joke is a typical example of some deaf peoples hostile attitude toward the predominant hearing society: One day three gentlemen were on a train—a hearing Russian man, a hearing Cuban man, and a deaf man. Suddenly, the Russian opened a window and threw a half-full bottle of vodka out. The deaf man wrote a note asking why he had thrown the

bottle away instead of saving it to drink later. The Russian explained, “At home I have PLENTY of vodka bottles! No need to worry about.” Later, the Cuban threw half of his expensive cigar out of the train window, and the deaf man wrote a note asking why he had thrown half of the long cigar away. The Cuban explained, “At home I have PLENTY of Cuban cigars! No need to worry about.” Then a few minutes later, the deaf man threw a hearing passenger out of the train window. Bewildered, both the Russian and the Cuban rushed to ask him why he had done that, and he responded in a note saying, “At home I have PLENTY of hearing people!” This story seems to demonstrate how much the deaf man wishes to have more deaf people around him for convenient communication and for better social life. Many hearing people, the story suggests, don’t understand or respect deaf people and their culture.

The genres of deaf folklore traditionally passed on among deaf people by “sign of hands” reflect the unique cultural and linguistic features and the strongly shared “deaf identity” within the deaf world surrounded by the predominantly hearing world.

Densmore, Frances (1867–1957)

Early student of American Indian music. Frances Densmore began field collecting around the turn of the century. A native of Red Wing, Minnesota, Densmore spent most of her long life in her hometown. At an early age she displayed an interest in, and an aptitude for, music; at Oberlin College she took a degree in music with the intention of becoming a teacher. Later she studied under Leopold Godowsky and won acclaim for her piano and organ performances as well as her lectures on Wagnerian opera. But in 1892, when she heard John Comfort Fillmore speak on American Indian music, and shortly thereafter when she chanced to meet Alice Fletcher, the course of her life's work was changed. Densmore soon started giving lectures and lecture recitals on Indian music; and in 1901 she began doing fieldwork, her initial efforts being among the Chippewas near her home. Later her interests expanded to other groups, and eventually she amassed more than 2,400 songs, a collection now housed in the Smithsonian Institution. From 1907 until her death, she was associated with the Bureau of American Ethnology.

Densmore's early efforts were evolutionary and heavily influenced by the work of Fletcher and Fillmore, but her later work became increasingly independent. Not only did she avoid theoretical considerations, she also ignored other writings on ethnomusicology. Her notes clearly indicate that the people she interviewed in her fieldwork were every bit as exciting to her as their music. Densmore considered herself to be a musical archaeologist, digging up the songs of yesterday but, unlike some collectors with similar aims, avoiding hasty work and a sense of urgency that might antagonize informants. She preferred showing respect for these people as individuals, an attitude that helped develop a relaxed relationship with those from whom she collected.

Her first publications were primarily popular accounts, but Densmore's later writings were of a more scholarly nature. Her studies generally combined a musicological analysis of melodies, their cultural setting, methods of making valid written transcriptions, and the historic and social significance and function of specific songs. She constantly refined and improved her techniques of recording and analysis. Despite her rigorous methodical approach, Densmore's accomplishments have been better received in musical than in folklore or anthropological circles. This was possibly due to the musical complexities of her highly specialized studies. She received honorary degrees from her alma mater, Oberlin College, and from Macalaster College; her work served as the basis for Alberto Bimoni's opera *Winona*. Densmore is also said to have inspired Charles Wakefield Cadman to write compositions with Indian themes.

Dialect Story

have circulated both orally and in print since America's linguistically diverse beginnings. Eighteenth-century comic almanacs regularly offered the unconventional locutions of stereotypical rural Yankees, Western frontiersmen, American Indians, Blacks, and Dutch

or German, French, Irish, Jewish, and Welsh characters. Similar publications flourished in the 19th century, while writers like Mark Twain and Joel Chandler Harris also integrated jocular dialect into “local-color” fiction.

By the early 20th century, immigrant Italian, Scandinavian, and Slavic characters had joined the comic parade through oral tradition, joke books, the vaudeville stage, and sound recordings. Sometimes intended for a mainstream American audience assuming superiority over some ill-spoken “other,” the dialect stories of folk and popular culture were just as often produced by and for particular dialect speakers who valued their community’s unassimilable verbal peculiarities.

In 1948, although mindful of the genre’s lineage, Richard M. Dorson nonetheless pronounced the dialect story “a new form of American folklore.” Dorson’s stance, following fieldwork in the Upper Peninsula of Michigan, was based less upon dialect texts than upon their sociocultural context. The egalitarian polyglot culture of Indian and immigrant farmers, miners, and loggers in the Upper Peninsula rendered “Yoopanese,” a babel of “foreign”-inflected English, the regions lingua franca. Subsequent generations of “Yoopers,” raised with the vernacular yet schooled in standard American English, continue to invoke “the lexical and grammatical errors, the special intonations” of their elders through dialect stories.

Disaster Folklore

The lore created in response to natural or human-made disaster. Events such as floods, earthquakes, hurricanes, tornadoes, or toxic chemical spills can permanently alter cultural landmarks and the natural landscape, rupturing the common body of knowledge crucial for everyday patterns of communication and living.

Common activities, such as driving, cooking, eating, and washing become major tasks following a disaster. While struggling to reestablish accustomed lifeways, disaster victims may also grapple with the alien bureaucracies of state and federal agencies as they seek emergency aid. Survivors struggle to build new life understandings out of nightmarish experiences that often defy their previously held assumptions about life order (Erikson 1976). Folklore helps victims make meaning of their disaster experience, wresting a new order from surrounding chaos. Psychological research with trauma victims indicates that the shared narratives and traditions that people create to cope with disaster play a crucial role in recovery. Story swapping encourages a renewed sense of partnership, countering the sense of loneliness that is often associated with widespread disorder (Ochberg 1993:780–81).

Disaster folklore is not limited to the lore created by victims. Outsiders, intrigued and disturbed by the news of a major disaster, often respond by creating sick jokes that make light of others' misfortune (Oring 1987; Simons 1986; Smyth 1986).

Although each disaster generates its own unique body of folklore, commonalities encourage the generation of jokes and legends that can float from disaster to disaster. For example, South Carolinians jokingly referred to 1989's Hurricane Hugo as a "four-billion-dollar blow job." Following Hurricane Andrew, Floridians sported T-shirts that described their experience in similar terms.

Some regions are especially prone to certain types of disasters: earthquakes on the West Coast, tornadoes and floods in the Midwest, hurricanes along the East Coast. In these instances, disaster folklore is integrated into regional lore, shaping notions of regional identity (Danielson 1990).

There are at least six phases of the disaster experience: warning and preparation, the disaster event, postdisaster damage assessment, cleanup and rebuilding, the first anniversary, and historicization. Each disaster phase generates a new set of folklore.

Warning and Preparation. Many disasters strike without warning, yet even unexpected disasters are presaged by a body of lore that admonishes humans to "expect the unexpected." Preparation lore includes homemade emergency kits; traditional methods for securing person and property, such as taping windows before a hurricane or constructing a tornado shelter; preternatural warnings, such as the appearance of the "Greyman" before violent storms in South Carolina or apparitions foretelling the loss of a loved one; and family stories of past disasters used as exemplars to prepare future generations for intermittent catastrophes. Some predisaster rituals are designed to flaunt danger, such as bacchanalian "hurricane parties."

The Disaster Event. Lore associated with the unfolding of a disaster event usually resembles disjointed and fantastic dream narratives. Some stories may boast of heroic or creative rescue. Disaster stories from this phase are fantastic accounts of personal experience, often embellished as they are later shared with other survivors (Ward 1991).

Damage Assessment. In the aftermath of a disaster, survivors evaluate present confusion within the frame of lost order. Documentation necessitated by insurance or relief-fund claims, which might include photos of fallen trees, crushed cars, or ransacked buildings, is often used to create homemade disaster “shrines.” Pictures tacked up on an entry wall may remain for years after the completion of repairs as a testimonial to the magnitude of the disaster experience. Owners of property prone to flooding may permanently mark and date annual water highs for all passersby to see.

Cleanup and Rebuilding. An often lengthy and uncomfortable process, cleanup generates stories that are grounded in situational humor, like the family without plumbing who develops humorous narratives about sharing bath water. Resentment toward long waiting lines, unscrupulous outsider repair firms that exploit survivors, and the morass of bureaucratic relief-agency paperwork may generate aggressive joking. FEMA (Federal Emergency Management Agency) jokes often circulate freely in federally declared disasters. Conspiracy theories, coupled with wishful thinking, may spontaneously transform into urban legends, such as the claim that federal authorities downgraded a 1994 California earthquake from its true Richter-scale reading because a reading greater than 7.0 allegedly would have exempted survivors from paying income tax.

The First Anniversary. The one-year anniversary, often a time of reflection, may be marked with community celebrations that applaud survivor recovery and ceremonies that honor the memory of victims. It is often at this time that disaster lore begins to become integrated within the fabric of local history.

Historification. As years pass, trauma stories, jokes, legends, and other traditional artifacts of disaster are pooled, transformed, and fashioned into traditional accounts that reassimilate the chaos of disaster within the larger historical understanding of the community. As accounts become normalized, the disruption in communication is healed.

Disaster lore is folklore in the making, a response to a systemic breakdown requiring the regeneration of patterns of communication. Careful examination of disaster folklore elucidates the process a community undergoes when it breaks down and must regenerate itself.

Dixon, Willie (1915–1992)

Blues songwriter. Born in Vicksburg, Mississippi, Dixon first learned religious songs from his mother, a self-taught poet. His father preferred the secular world of the blues. After studying quartet singing, Dixon joined the Union Jubilee singers and performed on the radio in Mississippi. Moving to Chicago in 1936, he became a boxer and worked with several musical groups—The Five Breezes, The Four Jumps of Jive, and The Big ThreeTrio, the latter the most commercially successful, performing a sophisticated three-part-harmony version of the blues. Later in life, Dixon worked with Memphis Slim and other, more down-home groups in order to showcase his own compositions.

A gifted musician, vocalist, producer and all-around blues businessman, Dixon is best remembered for his songs, blues classics that included “Back Door Man,” “Big Boss Man,” “Little Red Rooster,” “T’m Your Hoochie Man,” and “Wang Dang Doodle,” which he fed to Chicago stars Howling Wolf, Jimmy Reed, Muddy Waters, and KoKo Taylor.

A charismatic spokesman for the blues, Dixon set up the Blues Heaven Foundation to promote and preserve his chosen art form. His autobiography *I Am the Blues* (1989), was not an empty boast. His credentials included more than half a century of influence in the blues business.

Barry Lee Pearson

Dobie, J.Frank (1888–1964)

Folklorist. Dobie was so well known and so influential in the world of Texas letters that he was known as “Mr. Texas.” With a B.A. from Southwestern University in Georgetown, Texas, and an M.A. from Columbia University in New York City, Dobie spent most of his professional career, from 1914 until 1947, as an on-again, off-again teacher of English at the Uni-versity of Texas at Austin. Outspoken and liberal, he was frequently at odds with the university administration; nevertheless, although he never received a Ph.D., in 1933 he was promoted to full professor. His most lasting contribution to the University of Texas was the development of his pioneering course, “Life and Literature of the Southwest.”

An avid promoter and popularizer of Texas lore, especially legends, Dobie served as editor and secretary of the Texas Folklore Society from 1922 to 1942. His stated goal was “to open the eyes of the people to the richness of their own tradition.” Much to the consternation of later, professionally trained folklorists, he continually modified, rewrote, and “improved” the materials he collected from oral tradition.

His most significant publications, aside from the innumerable newspaper articles, magazine essays, and other journalistic pieces, are his more than twenty books dealing with Texas people and Texas lore. His first book, *A Vaquero of the Brush Country* (1929), a biographical study of a Texas cowman, received national recognition, as did *Coronado's Children* (1930), a collection of legends of buried treasure. Other significant works, which can be classified as natural history as well as folklore, include *The Longhorns* (1941), *The Voice of the Coyote* (1949), *The Mustangs* (1952), and *Cow People* (1964).

Dorson, Richard M. (1916–1981)

Folklorist and historian. Dorson earned three degrees in American civilization from Harvard University, and he taught at Harvard (1943–1944) and Michigan State University (1944–1957). In 1957 Dorson succeeded StithThompson as head of the Indiana University folklore program; he transformed the program into the Folklore Institute in 1963 and directed the institute until his death. Dorson's many other professional contributions included serving as editor of the *Journal of American Folklore* (1959–1963), president of the American Folklore Society (1966–1968) and of the Fellows of the American Folklore Society (1971–1972), and founder (1963) and editor of the *Journal of the Folklore Institute* (later renamed the *Journal of Folklore Research*).

Chief among Dorson's strongly held views was his insistence that American folklore be studied in terms of the unique history and culture of the United States. He outlined this approach in a now classic essay (Dorson 1959) and first exemplified it in *American Folklore* (1959). Dorson's pioneering fieldwork-based study of African American folklore, *Negro Folktales in Michigan* (1956), uncovered a rich vein of narrative traditions. It included an antebellum-based cycle of stories about the competitive interactions between the White Old Master and the Black slave-servant John. Dorson also focused attention on immigrant folklore, initially in a series of essays and in his 1952 book, *Bloodstoppers and Bearwalkers: Folk Traditions of the Upper Peninsula*. He demonstrated that folklore can be expressive of interethnic group contacts and relationships within American society (Dorson 1981), as well as of continuities and changes in the Old World-folklore heritage of members of individual immigrant groups. Fieldwork Dorson conducted in coastal Maine, Michigan's Upper Peninsula, and the industrial cities of northern Indiana served as bases for numerous books and essays that explore matters central to an understanding of regional and urban cultures in the United States.

While it was his principal focus, Dorson did not limit his inquiries to the study of American folklore. He wrote a major history of British folklore studies (Dorson 1968), and he edited volumes of important papers on Japanese (Dorson [1963] 1972) and African (Dorson 1972a) folklore and on folklore research in eighteen continents, countries, and other geographical areas outside the United States (Dorson 1961). He participated in and organized numerous international meetings, including a 1973 conference at which folklorists from four continents and thirty-one countries made presentations. (Dorson edited twenty-three of the papers for publication in *Folklore in the Modern World* [1978]) Concerned as well with the need for accurate and comprehensive teaching and research materials, Dorson also edited an important folklore textbook (Dorson 1972b) and a *Handbook of American Folklore* (Dorson 1983).

Dorson's convictions that folklore study should be fieldwork based and carried out in accordance with the highest scholarly standards made him an outspoken critic of purveyors of what he called "fakelore" (Dorson 1976). He also demonstrated repeatedly to colleagues in allied disciplines how their investigations could benefit from a knowledge

of folklore and familiarity with folklorists' methods and findings. Thus, in addition to being a devoted student, documenter, analyst, and teacher of folklore, Dorson was an outspoken proponent of scholarly standards and a dedicated advocate for his discipline as well.

Dowsing

A means for locating underground water with a forked twig or a divining rod. The dowser holds a branch of the twig in each hand and walks over a plot of land until the rod reacts by rotating in his or her hand. The practice originated for locating underground minerals in Germany around the beginning of the 15th century. Baron de Beausoleil (1576–1643) and his wife popularized the practice for finding water early in the 17th century, and the practice became widespread throughout Europe by the end of the century.

German and English settlers in North America brought dowsing with them. The written record on dowsing in North America is sparse before 1800; after that date, however, newspapers, magazines and other literature suggest widespread use of dowsing to find water, minerals, hidden treasures, natural gas, lost animals, and other objects. The prototypical dowser uses a forked twig to find underground water while walking over a plot of land. From the beginning, however, variations appeared in both Europe and the United States. E.Z. Vogt and Ray Hyman found that the peach tree was the single most popular source for the forked twig, with willow the second most popular (Vogt and Hyman 1979). Other sources were cherry, apple, persimmon, hickory, plum, pear, elder, birch, and maple trees. Metal rods and wire are frequently used in place of wooden rods. Dowsers also use crowbars, pitchforks, horsewhips, commercially made devices, and pendulums.

The object of the search also varies widely. Most frequently it is underground water. Other underground substances, such as gold, oil, ores, hidden pipes, and archaeological objects, have been targets. During the Vietnam War, American Marines used the divining rod to look for underground tunnels used by the enemy. As far back as the 17th century, some dowsers began using the rod to search for objects above the ground, such as criminals, missing persons, and lost animals. Typically, dowsers search for their targets on site. Increasingly, however, dowsers have claimed success in dowsing for water and other objects over a map rather than on the actual site.

Although members of the American Society of Dowsers and writers on the subject prefer to call the practice “dowsing,” the term “water witching” is more widely used among the rural practitioners in the United States. The term “water divining” is also popular, mainly in the Southeast. Vogt and Hyman also found the following terms in use: switching, water smelling, channel surveying, water finding, doodlebugging (most typically in relation to finding oil), and water prophesying.

The typical dowser in the United States charges a small

Ozzie Waters witches wells. Concord, California, 1940. American Folklife Center, Cowell Collection (WPA).

fee or nothing. He or she operates in rural areas and views the practice in pragmatic terms. For these dowzers, the practice has no occult connection. The members of the American Society of Dowzers, which was founded in 1960, on the other hand, tend to come from urban areas and treat dowsing as one of several occult techniques.

The evidence that dowsing “works” is merely anecdotal. The many tests of dowsing that use objective baselines for comparison have consistently found that dowzers do no better than chance. The proponents of dowzers denounce these tests as unfair because they place the dowser in an unfamiliar and hostile setting. Such objections occur mainly after the negative results have been reported.

Vogt and Hyman argued that the rod moves through involuntary muscular action—ideomotor action. The principle is the same as that involved in the pendulum, Ouija board, and table tilting. Today many proponents of dowsing agree that the rod moves because of involuntary muscular movements of the dowser. They insist that this response is triggered by a dowsing signal—one that comes directly from the underground water or that comes to the dowser through some form of extrasensory perception.

The involuntary movement of the dowsing instrument is quite compelling, and the experience creates a strong belief in the dowser. Believers use a variety of excuses to dismiss failures, such as interference from radio waves and inept drilling, and they dismiss the consistently negative findings from scientific studies as due to the limitations of science rather than to the invalidity of dowsing.

Vogt and Hyman's 1956 survey estimated that there were 25,000 dowsers in the United States. The typical dowser, they found, discovered his or her "powers" by watching a dowser in action. Usually, the process went something like this: Although skeptical, the observer accepted the dowser's invitation to try the rod. To the observer's surprise and consternation, the rod turned in his or her hands when the observer reached the location that the dowser had previously designated. The observer knew that he or she had not consciously made the rod dip. Not knowing about ideomotor action, the observer became a believer both in dowsing in general and in his or her ability to dowse.

Dozens

Short for “playing the dozens,” a predominantly Black male cultural form of verbal dueling most widely known as “sounding,” “the dozens,” and “the dirty dozens.” Other names for it, which vary regionally, include “signifying” or “sigging” (Chicago), “joning” (Washington, DC), “woofing” (Philadelphia), and “capping” (West Coast). The object of the contest, usually performed in front of an audience, is to artistically hurl insults, or “snaps,” against one’s opponents; the loser either backs down, runs out of insults and is therefore humiliated, or responds to verbal attacks with physical violence. From an examination of ethnographic data to support their claims, folklorists have subdivided the verbal art form into “signifying,” which refers to a speaker directly insulting his or her target, and “dozens,” which apply to insults toward the victim’s family members, most often the mother. Sometimes “sounding” refers to the initial exchanges, “signifying” to personal insults, and “the dozens” to insults on relatives. However, “sounding” can also refer to ritualized insult against a relative, while for somebody to “sound on” somebody else refers to a ritualized attribute of that person. In short, the above synonyms describe a verbal activity that can take on a wide range of meanings. H. “Rap” Brown, a 1960s civil rights leader, wrote in his autobiography: “The real aim of the Dozens was to get a dude so mad he’d cry or get mad enough to fight” (354). Moreover, Brown pointed out, “some of the best Dozens players were girls”; therefore, the game is not necessarily gender specific, although the content of the insults may be quite different.

The earliest essay devoted to the subject and its origins appeared in 1939 in the first volume of *American Image*, a psychoanalytic journal, in which John Dollard examined material from his study of Black adolescents in Southern and Northern cities. One of his informants explained that “the dirty dozens” (as opposed to “the dozens”) include references to the victim’s mother, sisters, father, and brothers (Dollard [1939] 1994). Roger Abrahams cites another possible source that suggests the term “the dozens” may have originated in reference to the bad luck of rolling a twelve in craps; however, Abrahams cites among other possible origins Mack McCormick, who, in the liner notes “to his record *Unexpurgated Songs of Men* gives the most compelling source, a formulaic song routine about the subject which began ‘I fucked your mother one...’ going up to twelve” (Abrahams [1963] 1970:261). On the other hand, Quincy Jones, in his foreword to *Snaps* (Percelay, Ivey, and Dweck 1994), understood through oral tradition that the term “dirty dozens” came from slavery. After the Atlantic crossing, auctioneers grouped the twelve most sickly looking slaves and sold them at a bargain rate. Says Jones, “The only thing even more degrading than slavery was to be part of this group. Insulting your mama was meant to make you feel as low as one of the dirty dozens” ([1993] 1994:8).

African ethnographic literature strongly suggests an African origin for “the dozens.” For example, William Schecter reported verbal contests of this kind existing among the Ashanti (in Percelay, Ivey, and Dweck 1994:28). Similarly, Alan Dundes reminds us of a 1951 study of the Gusii (a Bantu people) by Philip Mayer, which describes verbal dueling

among same-age boys engaging in a common initiation ceremony and who referred to one another's mothers pornographically (Dundes [1973] 1994:296–297). Participants (both audience and contestants) give such extreme license to one another that they usually allow participation only among those with whom it is safe to play. Generally speaking, “sounding” is an in-group process; when it occurs across group lines, its antagonists mean to provoke a fight (Labov 1972:304).

According to Abrahams, “sounding” is what crowds of boys do, and when they are just entering puberty they experiment with words and concepts they have overheard from adults. Although die contest is usually short, a definite pattern emerges, as in die following interchange taken from Abrahams' *Deep Down in the Jungle: Negro Narrative Folklore from the Streets of Philadelphia*:

I hear your mother plays third base for the Phillies
 Your mother is a bricklayer, and stronger than your father.
 Your mother eats shit.
 Your modier eats shit and mustard. (1970:48)

As the boys grow older, “the vilification of the mother is changed to sexual matters, the contests become more heated and the insults more noteworthy” (1970:48). The following, also from Abrahams' study, exemplify such vilification as adolescents insult one another:

I fucked your mother on an electric wire.
 I made her pussy rise higher and higher.

I fucked your mother between two cans.
 Up jumped a baby and hollered, “Superman.”
 At least my mother ain't no doorknob, everybody gets a turn
 (1970:49).

Effeminacy or homosexuality of the father or brother may also appear as common subjects, such as the following:

Least my father ain't pregnant in the stomach.
 Least my brother ain't no store; he take meat in the back (1970:50).

As Abrahams and other researchers have noted, certain contrastive linguistic features outline the rules of the game (Abrahams [1962] 1994:301). When Abrahams wrote on the topic in 1962, he observed the following features: (1) participants rely upon formulaic patterns; (2) the patterns often contain rhyme; and (3) speech rhythms change from natural ones to ones that conform to the formula. Furthermore, William Labov identified specific patterns from Black adolescents living in Harlem in the mid-1960s.

Constructions Labov analyzed included: “Your mother is (like)...” (“Your mother look like Flipper”); “Your mother got...” (“Your mother got a putty chest”); “Your mother so—she—” (“Your mother is so old she got spider webs under her arms”); “Your mother raised you on...” (“Your mother raised you on ugly milk”); “I went to your house...(I went to your house to ask for a piece of cheese. The rat jumped up and say, ‘Heggies [“dibbs” or “halfies”], please””) (Labov 1972:276–283).

By the 1990s, hip hop had influenced the ritualized entertainment, while rhymed couplets of earlier “dozens” often emerged as one-liners: “Your mother is so stupid, she thought Boyz II Men was a day-care center,” and “Your mother is so dumb, she couldn’t pass a blood test.” Exhibiting several similarities with those constructions Labov identified, these last two examples come from the more recent collection of ritual insults in *Snaps* (Perceland, Ivey, and Dweck 1994). Certainly not as analytical as Labov’s study, *Snaps* nevertheless provides not only a brief history of “the dozens,” but also offers seventeen types of ritual insults that come from both folklore and popular culture, such as fat snaps (“Your mother is so fat, she broke her arm and gravy poured out”—from the movie *White Men Can’t Jump*); stupid snaps (“You’re so dumb, you think Taco Bell is a Mexican phone company”); ugly snaps (“If ugliness was a crime, you’d get the electric chair”); old snaps (“Your mother is so old, she knew Burger King when he was just a prince”); and, of course, sex snaps (“Your mother is like an elevator—if you push the right button she’ll go down on you”).

Within these evolving guidelines for ritual insults, contestants not only develop important linguistic skills that require creativity, wit, and humor, but they also learn self-control. Moreover, as researchers have pointed out, “the dozens” are also, to a much lesser extent, played by females as well as White males, though their functions and content are decidedly quite different. Dollard and Abrahams, whose data come from Black males, have provided the most classic interpretations of “the dozens.” Dollard explained them in light of race relations and displaced aggressions among Blacks. Abrahams thought of them as a reflection of tensions emerging from the Black family structure, from which eventually “black males find themselves in a totally male environment in which the necessity to prove one’s masculinity (and to reject the feminine principle) recurs constantly (Abrahams 1970:54). Because the young boy cannot openly attack his own mother either to himself or to others, he creates a play situation that enables him to attack some other person’s mother, thereby “exorcising” his mothers influence (Abrahams 1970:55). By playing “the dozens,” the combatants not only develop defense mechanisms, but each also builds up his own self-image and affirms his own masculine characteristics. Despite their compelling arguments, such explanations do not provide how “the dozens” might function among females; nevertheless, Dollard, Abrahams, and the additional authors cited below merit the attention of any scholar wishing to pursue further inquiries into “playing the dozens.”

Drama, Folk

A theatrical performance given for a specific and cohesive group of people, wherein the actors and the audience are conscious of both their roles in the performance and their shared identity as group members. The form that the drama takes varies, the most common being performances by human actors; but folk dramas also rely upon pantomime, puppetry, shadow figures, or any combination of these forms.

These dramas range from informal, even spontaneous, performances to highly elaborate, well-planned, and rehearsed productions; from one-person monologues to large casts; from improvised lines to written dialogue. The more elaborate forms of folk drama include songs, costuming, and stage props, while the simplest are little more than a single actor in street clothes ad-libbing to a one-member audience. What all folk dramas have in common, however, are (1) at least one role-playing performer, (2) a plot, storyline, or coherent scene, and (3) an established “distance” between actors and audience, such as a stage or a space specifically cleared or marked for the theatrical production.

Folk dramas are often performed as part of religious rituals and festivals and, in this context, usually have their roots in Old World theater. The reenactment of stories from the Old and New Testament, of saints’ lives, or of hero tales from legendry and myth, or the dramatic interpretation of some important point of religious dogma or philosophy made up the bulk of medieval European mystery plays, passion plays, miracle plays and combat dramas, and immigrants have brought these ancient forms of drama from Europe to North America. Among the earliest of these migratory folk dramas were the Spanish *pastorelas*: plays that recounted and celebrated the birth of Christ, not only through the retelling of the New Testament story, but also through scenes of combat between St. Michael and Lucifer over the soul of the infant Jesus and comic scenes depicting shepherds and other peasants. These plays, as well as other dramas of Spanish origin, continue to delight and instruct Christmastime audiences in churches, halls, outdoor squares, and homes in Hispanic communities, especially in the Southwest.

English and Irish immigrants brought Christmas mumming dramas to the New World: Troupes of actors would house-visit in their communities during the holiday season and perform combat dramas wherein St. George (or some other heroic character) would fight with and defeat The Turkish Knight (or some other, usually non-Christian, figure); The Doctor would often revive The Turkish Knight, who would then pledge his loyalty to the hero. These ritual combats between good and evil were most commonly performed in Newfoundland and in the West Indies, although by the mid-1990s such productions were rare, except as performed by professional and semiprofessional actors in the context of folk revival.

Perhaps the most common Christmas folk drama, however, is the school Christmas concert. All over North America, schoolchildren, under the direction of their teachers, perform elaborate stage productions before family and neighbors. Often these dramas relate to Christmas themes, either retelling the story of Christ’s birth or acting out a visit from Santa Claus, but many of these productions include secular skits, usually comic or

melodramatic, on a wide variety of themes. Of course, at other times of the year schools put on dramas, and whereas these productions are staged primarily for the benefit of the students, their parents, and members of the immediate community, they are a part of the folk-drama tradition. Likewise summer camps, scouting troops, and other organized activities for children are a venue for skits and other forms of folk drama.

Easter pageants, which retell the story of the crucifixion of Christ, are common among the church services of several ethnic and immigrant groups (for example, Hispanic Americans and German Americans), as well as among community groups. Similarly, a number of African American churches include folk dramas in their yearly cycle of services, most of which are morality plays of the Everyman or Faustian type. For example, the congregation of the Northside New Era Baptist Church of Indianapolis, Indiana, has produced *In the Rapture*, while *Heaven Bound* has been part of the Easter celebrations of African American churches in Georgia and South Carolina (among other places), and *The Old Ship of Zion* is a mainstay of churches in many parts of North America. In all of these African American productions, the devil, as a comic trickster figure, battles with the forces of righteousness for the soul of a mortal.

A similar transplant from the Old World is the *purimshpil*, which forms a part of the celebration of the Jewish festival of Purim. Especially among Hasidic Jews, congregations will perform either the story of Esdier, Mordecai, King Ahasuerus, and the villainous Haman (taken from the Book of Esther), or some other Old Testament story; the Bobover Hasidic community of Brooklyn, New York, for example, has retold the story of Abraham and Isaac as part of its Purim celebrations.

Because folk drama demands a certain intimacy between actors and audience (all of whom are a part of the same group—for example, a single church congregation or a cohesive ethnic community), most of these ritual dramas include local, secular themes within their productions—themes that relate more directly to community life than do the larger biblical or religious themes of the dramas. Current events, local characters, politics, and community in-jokes, as well as the shared knowledge and understanding of movie stars, television shows, and other aspects of popular culture, are all grist for the folk-drama mill. This intimacy also allows considerable flexibility during dramatic performances: ad-libbing, interjections from the audience, and even roughhousing between the actors and members of the audience are all characteristic of folk drama.

The one exception in ritual drama is its use in certain rites of passage, where the traditionality (and, therefore, inflexibility) of the performance is paramount in fulfilling the rite. The best example of this form of theater is the initiation drama performed by Freemasons: The acting out of the murder of Hiram Abif must be done without any variation in the plot or script from one performance to the next (although variation does occur in costuming, props, and other peripheral matters).

While religious rituals act as a venue for many forms of folk drama, the secular world provides even more opportunities for such performances. Although little documented, occupational groups often perform skits during company picnics and other such get-togethers; these skits are almost always comedies and parodies involving the reenactment (in exaggerated form) of everyday work, workplace characters and stereotypes, and interactions between workers and the outsiders with whom they must deal. For example, health workers in one hospital produced a drama made up of interlocking skits that, among other things, portrayed an anesthesiologist as a samurai warrior, commented on

malpractice insurance, and made fun of hyperactive patients. Such skits are usually irreverent and esoteric, and they can be quite shocking to unknowledgeable outsiders.

Of a more serious nature, labor groups have used drama to protest unfair working conditions. As a means of raising the consciousness of workers or setting the proper emotional tone before or during a strike-action, union organizers sometimes produce in-group dramas in which workers can act out their frustrations with management and rehearse their demands. This same form of drama sometimes becomes "street theater," when it is performed in public as part of a strike or a labor demonstration. Chicano farm workers in California have been especially adept at this form of drama, but some of the same strategies have found a place among political demonstrators and protest movements throughout North America.

Folk drama functions most clearly as a way of raising consciousness and developing self-awareness in the context of group psychotherapy, where a group member, under the guidance of a therapist, will sometimes create a personal, autobiographical drama, using some members of the therapy group as supporting actors, while the rest of the group acts as audience for the performance. This therapeutic method is called psychodrama. Group gestalt therapy also makes use of theatrical conventions in its treatment of patients. Self-help groups, as well, make use of drama, as when, for example, graduating students and unemployed workers perform mock interviews in preparation for entering (or reentering) the workplace.

Skits performed within the context of a region or a family are also forms of folk drama. For example, mock wedding dramas are quite common in various parts of North America. Often involving cross-dressing, bawdiness, and local satire, these parodies of the traditional wedding ceremony take several forms. In small Saskatchewan prairie towns, for example, cross-dressed performers will honor a couple's milestone wedding anniversary (usually the twenty-fifth) with a mock wedding that includes humorous incidents from the couple's past; in North Carolina (among other places), men's volunteer fire departments will produce womenless weddings as a community fundraiser; especially in the Southern states, church socials sometimes include a Tom Thumb wedding, a parody in which children perform the roles.

A more elaborate type of community folk drama involves the retelling of the history of a region. In such dramas, often performed outdoors, local people reenact, for the benefit of their neighbors, the European settling of their community, important local historical events, or local legends. For example, since the early 1960s the people of Big Stone Gap, Virginia, have produced *Trail of the Lonesome Pine*, which tells the story of industrialization and the clash of cultures in their area in the 1890s. As with much ritual folk drama, certain people or families in the region will sometimes take responsibility for a specific role in the drama, with the part handed down from one generation to the next.

Of course, any form of community drama performed by locals and directed toward members of that community is folk drama. Even the plays of Shakespeare and other masterpieces from the world of popular and elite theater enter the repertoires of local actors and become transformed into folk drama. As in other forms of folklore, there is a constant interplay and interchange between folk drama and other theatrical traditions.

The dividing line between folk drama and other kinds of drama, however, is not always clear. For example, folk-play movements (such as the Carolina Playmakers) employ writers to construct dramas about regional history and traditions, and these plays

are usually presented to people from the region, but the actors, directors, and writers may not all be from the area, and these dramas travel, rather than stay in any one community; thus, there is not the intimacy between actors and audience usually associated with folk drama. Likewise, local dramas performed on radio and television (such as local radio performances of Pennsylvania German dialect plays) cannot achieve the intimacy and shared performance of their live counterparts.

Many kinds of popular theater are related to folk drama, especially traveling shows that play in small communities. Chautauquas, circuses, tent shows, medicine shows, magic shows, and minstrel shows relate to folk drama in their use of traditional material, their incorporation of local knowledge into their performances, and their evocative and nostalgic natures. Dramas such as professional wrestling and Punch and Judy puppet shows play out the same combat between good and evil, comedy and tragedy, which is at the heart of the ritual dramas described above. Professional ethnic theater (such as Yiddish theater), of necessity, makes use of shared traditions and esoteric knowledge. But in all of these cases, the intimacy demanded of folk drama is diluted by too great a social distance between actors and audience.

Yet folk drama also dilutes its intimacy when played before outsiders. For example, performers of African American morality dramas travel far from their congregations to play before general audiences, while community historical dramas cater to tourists and other outsiders. Even audiences for local mock-wedding dramas, school Christmas concerts, and occupational skits often include outsiders who might be unfamiliar with local dramatic aesthetics and traditions, and who may not understand in-joke references in the scripts. Thus, folk-drama actors often play to two audiences at the same time—insiders and outsiders—which results in their productions being partly folk and partly popular. All drama lies on a continuum of intimacy, with “pure” folk drama being the most intimate and “pure” popular drama being the most distant.

By the same token, not all folklore that has dramatic qualities is folk drama. For example, games and play often demand role-playing, but there is no clear separation between audience and actors in this context. There are many masking traditions (Halloween house visits, Mardi Gras, and parades, for example) in which performers play roles and are certainly separated from their audience, and in which costuming can be quite elaborate, but there is no coherent, narrative structure nor set of scenes in such performances. Pranks include many elements of folk drama, yet the dupes—the main performers in pranks—are unaware of their status as actors, and thus they do not consciously distance themselves from their audience.

But there is a continuum here from conscious drama to unconscious drama. The school clowns who, in front of their classmates, spontaneously imitate and caricature their teachers are performing dramas in perhaps only a semiconscious way; the nurse who uses an anatomically correct puppet to explain operations to young patients might be a conscious actor, but the children might not be consciously aware of their roles as an audience. While the boundaries of folk drama might be unclear, at the center of this tradition is an intimacy and shared consciousness of purpose among actors, directors, writers, stagehands, and audience.

Dulcimer

A fretted instrument of the box-zither family, variously known as the “Appalachian dulcimer,” “mountain dulcimer,” “lap dulcimer,” “plucked dulcimer,” or “Kentucky dulcimer.” Characteristically, the dulcimer features three or four strings stretched along a fingerboard that runs the length of an hourglass- or teardrop-shaped hollow sound box. The Appalachian dulcimer is a southern Appalachian folk instrument unrelated to the similarly named “hammered dulcimer,” which is a trapezoidal board zither whose strings are struck with hammers.

With origins in northern European instruments such as the German *scheitholt*, the Scandinavian *langeleik* and *hummel*, and the French *epinette des Vosges* brought by German immigrants to the Shenandoah Valley, the dulcimer’s characteristic design was developed in areas of southwestern Virginia and eastern Kentucky at the beginning of the 19th century. Even though the instrument itself appears to have no direct antecedent in the British Isles, the musical repertoire consisting of lyric and frolic songs, ballads, and dance tunes reflects the Scots-Irish heritage of the Southern Appalachian Highlanders who fashioned the instrument to accommodate their musical aesthetic. The distinctive melody with drone accompaniment texture of the dulcimer may be a more gentle echo of similar bagpipe style and timbre.

As the dulcimer is a material artifact of folk culture, there is considerable variation in the design, dimensions, and materials of the instruments crafted by different artisans. Customary physical features usually include: (1) an hourglass- or teardrop-shaped sound box approximately 32 inches long and 2 inches deep with a softwood belly (pine or spruce) and hardwood sides and back (cherry, maple, or black walnut); (2) a hardwood fingerboard, whose underside is hollowed out to transmit sound and then mounted over the vertical axis of the sound box; (3) a strum depression approximately 5 inches long scooped out toward the base of the fingerboard; (4) a scale of eighteen diatonically arranged wire frets spanning the length of the fingerboard (each fret extends across the width of the fingerboard although originally the frets lay only under the melody string); (5) variously shaped sound holes cut into the top plate of the sound box (hearts and violin-like “F” holes are common); (6) a peg box with tuning devices (friction pegs and machine heads are common) for each string, located above the nut at the head of the instrument; and (7) fastening devices below the bridge at the base of the dulcimer.

On the Ala-Sippi Dulcimer Association's Dulcimer Day, Juanita Keys plucks a dulcimer while Charles Keys bows a saw; behind them sits a technician. Tishomingo, Mississippi, 1987. American Folklife Center.

Musicians usually play the dulcimer seated, with the instrument laid across their lap and the melody strings located closest to them. Pitches are obtained by depressing the string over the fret with fingers or a short stick called a “noter” or “fretter.” Traditionally, only the melody strings were noted to create melodies and countermelodies, with the other strings resonating as an open drone. As the dulcimer has diatonic rather than chromatic frets, various tunings are used to accommodate the different modes, such as Ionian, Aeolian, and Dorian.

Sound is created by strumming the instrument with fingers or a plastic pick (originally feather quills and twigs), although several historical instances of bowed dulcimers have been documented as well. Modern dulcimer technique has been expanded to include chording, chromaticism, note bending and vibrato, elaborate finger picking, and the use of various electronic effects. Because of the gentle tone and soft dynamic response, the dulcimer has traditionally been used in intimate settings as a solo instrument or as an accompaniment for voice. Since the 1950s, however, recording technology and

amplification have provided the instrument with great flexibility in arrangement and performance.

Historically, dulcimer building and performance activity appear to have been limited to small extended-family enclaves within the mountains during the 19th century. However, dulcimer-related activity increased markedly at the beginning of the 20th century concurrent with the establishment of the settlement schools. According to David Whisnant, the instrument represented the genteel “Bradley-Furman” version of Appalachian culture that the settlement schools were attempting to inculcate. Whisnant wrote that “...the shadowy and presumably ancient origin of the dulcimer was appealing; its plaintive, simple sound was congruent with prevalent assumptions about ‘Elizabethan’ culture in the mountains; and perhaps best of all, the instrument was physically unsuited to playing the lively banjo tunes that were insinuating themselves into more and more mountain households” (Whisnant 1983:98). In particular, the Hindman Settlement School in Knott County, Kentucky, played a central role in the dissemination of the dulcimer both inside and outside Appalachia through the building and marketing activity of “Uncle” Ed Thomas (1850–1933) and Jethro Amburgey (1895–1971).

Spreading forth from its regional settlement school base, the dulcimer experienced a sharp increase in visibility and popularity concurrent with the folk revivals of the 1930s through the 1960s. Sparked by the public performances, recordings, and publications of performers such as John Jacob Niles, Paul Clayton, Frank Noah Proffitt, I.D. Stamper, and, especially, Jean Ritchie, the instrument experienced a “revival” of popularity that brought it out of regional obscurity and into widespread national consciousness. Today there is a national network of builders, players, teachers, dulcimer clubs, and festivals, and a quarterly journal, *Dulcimer Players News*, devoted to dulcimer-related activity.

While many performers and craftspeople seek to preserve traditional style and practice, others are actively expanding the dulcimer in new directions. Late-20th-century performers such as Robert Force, Lois Hornbostel, and David Schnauffer have stretched the repertoire and technique far beyond the instrument’s folk origins. Correspondingly, builders have modified the instrument’s basic design to incorporate chromatic frets, scalloped fingerboards, and MIDI (musical instrument digital interface) electronics to accommodate innovative performance techniques.

Dusenbury, Emma Hays (1862–1941)

Blind Arkansas singer of traditional ballads and songs. Born in Georgia, Emma Hays moved with her family to Arkansas in 1872. She learned many of her songs during the eight years she lived with her family in Baxter County; these were years of hard work but also of church meetings, play parties, and Sunday afternoon song sessions. In the late 1880s, Emma married Ernest Dusenbury, an itinerant worker with a taste like hers for music and dancing—"I wasn't blind in my heels, nohow." They had one daughter, Ora. Four years after her marriage, a prolonged fever left her blind. In 1907 the family settled to farming near Mena, Arkansas. Ernest suffered a crippling accident ten years later, but he lived until 1933.

Apparently discovered by Professor F.M. Goodhue of Commonwealth College in Mena, between 1930 and 1936 Emma Dusenbury sang for collector Vance Randolph, author John Gould Fletcher, composer and Arkansas Symphony Director Laurence Powell, and collectors John Lomax and Mrs. Sidney Robertson, among others. Randolph printed twenty Dusenbury songs in *Ozark Folksongs*, including fine versions of Child 13 and 49 and an unusual tune for Child 289. Lomax, in a two-day marathon, recorded eighty-two songs. Robertson recorded forty-three, including approximately seven songs also recorded by Lomax. The Lomax and Robertson recordings now reside in the Library of Congress. Dusenbury's large repertoire is representative of the southern mountain tradition, though especially strong in ballads and other early and rare items. Emma Dusenbury sang for the Arkansas State Centennial celebration at Little Rock in 1936. Five years later, she died and was buried by the county.

Dutch Americans

Immigrants and their descendants from the Dutch-speaking Netherlands and certain adjacent provinces. These include Flemish-speaking Belgium, *Plattdeutsch* (Low German)-speaking Germany, Frisian-speaking Friesland (the Netherlands), and others, including even Scandinavians who were culturally considered “Dutch” in 17th-century New Netherland.

True Dutch Americans should not be confused with the “Pennsylvania Dutch,” who are actually *Deutsch* (the German word for “German”). The confusion comes from the fact that two hundred years ago the Dutch language was called *Nederduits* (the Dutch word for “Low German”) or simply *Duits*. In modern Dutch, the name of the language is *Nederlands* or *Hollands*. But the latter term also causes confusion, since it is common for the Dutch to refer to their country as Holland even though that term properly refers to only the two provinces of North and South Holland.

Dutch immigration to North America came in two waves: first the approximately 100,000 immigrants and their descendants who came to colonial North America by 1790; and, second, the more than 250,000 Netherlanders who immigrated during the 19th century. The first wave of immigrants settled primarily in the Hudson River Valley, Long Island, and northern New Jersey. About half of the people in the colonial migration came, not from the Netherlands itself, but from provinces adjacent to the Netherlands. The second wave settled primarily in the Midwest, clustering in towns such as Holland and Grand Rapids, Michigan; Pella and Orange City, Iowa; Cedar Grove, Wisconsin; and Edgerton, Minnesota.

In the 20th century, these Midwestern Dutch communities developed what folklorist Richard Dorson termed “presentational” folk festivals, in which a highly romantic and stereotyped image of Dutch traditions was presented primarily for tourists. These festivals featured tulip gardens, re-creations of Dutch windmills, wooden shoe dancing, and street scrubbing.

Similarly, the folklore of the colonial Dutch population was satirized in the writings of Washington Irving in such short stories as “The Legend of Sleepy Hollow” and “Rip Van Winkle,” published in *The Sketch Book* (1819–1820) and his facetious *A History of New York* (1809), written under the pseudonym Diedrich Knickerbocker. Irving’s caricature of Dutch folk traditions was so influential that the term Knickerbocker came to mean a native New Yorker—hence the name New York Knicks for the professional basketball team.

The term “Dutch” itself, in American slang, has taken on a negative meaning, as in “Dutch treat” (which is not a treat at all), “Dutch uncle” (which refers not to an uncle, but to someone who scolds), and “Dutch courage” (which means false courage, especially under the influence of alcohol).

Little remains of genuine Dutch American folklore, but it is possible to reconstruct from written sources the traditions that were transplanted by the settlers of New

Netherland in the 17th century and survived through the end of the 19th century, especially in the rural, farming areas.

Two distinct dialects of spoken Dutch developed in New York and New Jersey, one called “Jersey Dutch” and the other “Hudson-Mohawk Dutch” or simply *de Tal* (literally, “the language”). Each dialect contained English and Native American loan words, Algonquian words in Jersey Dutch and Iroquoian in Hudson-Mohawk Dutch. In addition, there developed among free Blacks and slaves in the Dutch American culture area a distinct variant of the dialect. These spoken dialects survived into the opening decades of the 20th century. The last known speaker of Jersey Dutch died in the 1940s.

The same creolization of Dutch and English culture that occurred in the language is also evident in the folk music and dance. In 1787, the Scottish American physician Alexander Coventry noted in his diary that the Dutchmen he observed in a tavern near Catskill, New York, sang in both English and Dutch. He wrote: “Mr. Demun from Esopus, was singing a Bagatelle; first he sang it in Dutch, and then he sang it in English. Then Peter Yates sang what is called ‘The Song.’...Then he sang ‘The Debtor,’ also several Dutch songs...” Later, in 1802, Coventry accompanied Jeremiah van Rensselaer and the latter’s two sisters on a wagon ride, and he noted, “When we came to the wagon again Mr. V.R. desired me to take a seat at his side, which I did and had the pleasure of the young ladies sing a number of songs, of which several were Scottish.” Coventry also noted that the Dutch farmers of the Upper Hudson Valley were fond of dancing reels, another cultural borrowing from the British Isles.

Notwithstanding these cultural borrowings, a Dutch folksong tradition survived through the end of the 19th century. Several of these songs from Ulster County, New York, were written down about 1907 by local historian Benjamin Myer Brink. One such song was *De Pruttelarij Voerman* (“The Grumbling Wagoner”):

Eens had ik mijn wagen verhuurd, en dat aan oude wijven,
 Toen zij op der kermis kwamen, gigen zij aan’t kijven;
 Nooit meer wil ik het wagen, ouder wijven in mijn wagen.
 Rijdt wat an, wagen, wagen. Rijdt wat an, voerman.
 (Once had I my wagon hired, and that to old gossips,
 Soon as they reached the fair, all began to scold;
 No more will I hire the wagon, have old hags in my wagon.
 Ride on wagon, wagon. Ride on, wagoner.)

The song continues with verses about *oude mannen* (old curmudgeons), *oude dochters* (old maids), and *oude heeren* (old lords). In each case, the wagoner resolves never again to transport that group of people in his wagon, until in the last verse, he takes *jonge dochters* (young women) to the fair:

Eens had ik mijn wagen verhuurd, en dat aan jonge dochters.
 Toen zij op de kermis kwamen werden zij al verkocht er;
 Verkocht al hier, verkocht al daar.
 Jonge dochters is goede waar.
 Ik wil wel laden op mijn wagen van de jong dochter.
 Rijdt wat an, wagen, wagen. Rijdt wat an, voerman.

(Once had I my wagon hired, and that to young women.
 Soon as they reached the fair, every one was taken;
 Were purchased here, were purchased there.
 Young women are good wares.
 I will load up my wagon with young women.
 Ride on, wagon, wagon. Ride on, wagoner.)

The references in the song to the agricultural fair (*kermis*), a tradition that did not survive the 17th century in America, and to the old lords (*oude heeren*), an aspect of European social structure that did not come to America, indicate a survival in the folk memory of the culture of the old country. The attitudes toward young women expressed in the song, which depart from the strict Calvinist teachings of the Dutch Reformed Church, suggest that folk attitudes do not always correspond with the official doctrines of the church.

Some of the folklore that survived the longest was that which was learned the earliest—namely, children’s folklore. One nursery rhyme in particular, “Trip a Trop a Troontjes,” has been collected in the Netherlands, South Africa, and Bergen County, New Jersey, as recently as the 1930s:

Trip a trop a troontjes,
 De varkens in de boontjes.
 De koetjes in de klaver,
 De paarden in de haver.
 De eenjes in de water-plas,
 De kalf in de lange grass;
 So grott mijn kleine poppetje was.

(Trip a trop a troontjes,
 The pigs are in the bean vines.
 The cows are in the clover blooms,
 The horses in the oat fields.
 The ducks are in the waterpond,
 The calf is in the long grass;
 So tall my little baby was.)

Much of Dutch American folklore was related to farming, which is not surprising considering the fact that the Dutch American farmers were the main bearers of this folk tradition, the urban merchants having quickly acculturated to the dominant English ways after the English conquest of New Netherland in 1664. There were Dutch rhymes that were recited to ensure a good crop:

Klip. klop. bovenop.

Zet je hoed al aan je kop.
 Draaie, vleie, drie maal zaaie,
 Pluk de veere van de kaaie.

(Klip, klop, bovenop,
 Set your hat on your head.
 Turn, go, three times sow,
 Pick the ferry from the quay.)

Other sayings were folk remedies to cure sick livestock. For example, if a horse had worms, you should take the animal into the yard and stroke its abdomen while repeating the charm, "*Marie demoeder's Heere, ghing over de land. Se had drie worme in d'r hand. De een wat wit, nander swaاتم, de derde was rood. Soo gha je dood.*" ("Mary, mother of the Lord, went over the land. She had three worms in her hand. The one was white, another black, and the third was red. So you shall die.") If a horse had the hiccups, you stroked it three times and turned it around by its head in the sun, while saying, "*De heiligh seght: Joseph ghing over'n Akker. Daar vond hy drie worme. De een swaart, nander bruin, de derde was rood. Je sal starveghan dood.*" ("The saint says: Joseph went over the field. There he found three worms. One was black, another was brown, the third was red. You shall drop dead.") The invocation of "Mary, mother of the Lord," "the saint," and "Joseph" in these charms is evidence of Catholic survivals in the folk beliefs of the Protestant Dutch. Folklorist Don Yoder has noted similar survivals of Catholicism among the Pennsylvania Germans.

Distinctive Dutch American customs were associated with Shrove Tuesday, Easter, Whitsunday, and Saint Nicholas Day. Some of these customs, which survived through the 19th century, were observed by slaves and free Blacks living in New York and New Jersey.

The main traditional activity associated with Shrove Tuesday (the day before Ash Wednesday and the beginning of Lent) was "riding the goose." This custom consisted of riding on horseback past a greased goose suspended by a rope and trying to pull off its head. The Dutch Reformed Church disapproved of this custom, and the Director General and Council of New Netherland repeatedly banned it, but to no avail. There is no evidence, however, that the custom of riding the goose persisted past the 17th century.

The Dutch name for Easter was Paas, which the White Dutch and their slaves celebrated for two days. As with other European groups, colored eggs, symbolizing Christ's resurrection, were part of the Dutch American Easter festival. Another part was the preparation of *Paas* cakes, made from a batter of eggs and flour, fried on an iron "spider" (a skillet with legs).

Pentecost, or Whitsunday, was known as Pinkster among the Dutch Americans. Its religious significance was to commemorate the appearance of the Holy Ghost to the Apostles after Christ's crucifixion. In its folk manifestation, it became a springtime carnival festival, celebrated by both Blacks and Whites for two days. In the early 19th century, Blacks in Albany and from the surrounding countryside would assemble on the day following Pinkster under the leadership of a slave known as King Charles. Dressed in

the costume of a British soldier, he would lead what was described as a “Guinea dance” to the accompaniment of fiddle, flute, fife, Jew’s harp, drums, banjo, and the tabor. From contemporary descriptions, it seems that Pinkster in Albany was an Afro-Dutch celebration with certain African cultural survivals. Thus, it was akin to the carnival celebrations in New Orleans, the Caribbean, and South America. Ironically, Pinkster survived longer among the Blacks than the Whites. In 1874 local historian Gabriel Forman wrote that on Long Island “poor Pinckster [*sic*] has lost its rank among the festivals, and is only kept by the negroes; with them, however, especially on the west end of the island, it is still much of a holiday.”

Saint Nicholas is the patron saint of Amsterdam, and his Saint’s Day is celebrated in the Netherlands on December 6. He appears on the eve of the holiday dressed as a bishop on horseback and accompanied by his servant, Zwarte Piet (Black Peter). Children receive gifts in their shoes, which they set out overnight. There is some doubt, however, whether this Saint’s Day was ever celebrated in Dutch colonial America. In the 19th century, St. Nicholas became associated with the holiday of Christmas, in part because of Washington Irving’s description of St. Nicholas in *A History of New York*. Some Dutch Americans retained the custom of placing gifts in children’s shoes, but on Christmas, not St. Nicholas Day. Thus, a Dutch patron saint was associated with a holiday that was German in origin and English by adoption, resulting in another example of the cultural syncretism that occurred among the Dutch in America.

Easter

Christian holy day and holiday. Commemorations of Jesus' resurrection have figured in the liturgical calendar since the beginnings of Christianity. The problem of choosing a date for the celebration vexed the early church as it tried to resolve differences between the Jewish lunar calendar that determined the date for Passover, during which, according to the New Testament, the crucifixion and resurrection occurred, and the solar calendar of the Roman world. Relying solely on Passover itself meant that Easter might fall on any day of the week, but both Eastern and Western branches of Christianity agreed that the festival should occur only on Sundays. The two major Christian traditions also agreed that the date should be the first Sunday following the full moon that appears on or after the vernal equinox. This means that the actual date for Easter may range from March 22 to April 25. The Eastern church has also specified that Easter must occur after the beginning of Passover. Consequently, its observance may fall one to five weeks later than the celebrations of Western Christendom. While important in its own right, the date for Easter also affects the timing of other holy days, including Good Friday, Ascension Day, and Pentecost.

Since it is more specifically religious than Christmas, Easter has received less secular recognition. However, in some parts of the United States, schools' spring vacations may be scheduled to incorporate the week preceding Easter. Formerly, even public schools arranged holidays for the Friday preceding and the Monday following Easter weekend.

The move away from official governmental sanction of Easter has not retarded development of a national Easter culture, which centers primarily on extrareligious elements of the holy day, many of which probably derive from pre-Christian fertility symbolism in Europe. The gift-bearing Easter bunny and Easter egg hunts and rolls (one of which occurs on the White House lawn) need not reflect Easter's religious significance, but can suggest the reawakened fecundity of spring. This seasonal focus has also made Easter a time for purchasing and wearing new clothing in bright and pastel colors to contrast with the somber hues of winter attire.

For Christians who observe the Lenten season, Easter represents the end of a forty-day period of self-denial. Even though the strict fasting and abstinence that once characterized Lent have been mitigated, Easter continues to provide a sense of release and relief. Consequently, in addition to their attendance at worship services (perhaps the only time in the year some may go to church), Christians pay considerable attention to the Easter meal, which is likely to feature a festive meat dish such as roast turkey or baked ham with new spring vegetables. Ethnic foodways have also focused particular attention

on Easter. Italian Americans, for example, bake braided and glazed Easter breads that contain whole hardboiled eggs, or Easter pies made from ricotta cheese and wheat or rice.

Other ethnically distinctive features of American Easter celebrations include bonfires set on the hills surrounding Fredericksburg, Texas, by German Americans and reenactments of Christ's Passion among Hispanic *penitentes* in northern New Mexico. The Yaquis of southern Arizona have developed an elaborate dramatization of the conflict of good and evil that climaxes at Easter. On each Friday during Lent, figures representing Roman soldiers and Pharisees search for Christ, their menace softened by comic touches. They finally find him (represented by a crucifix) on Holy Thursday, crucify him the next day, and try to commandeer the church on Saturday. Repelled by members of church organizations and traditional Yaqui figures such as deer dancers, the evil forces unmask to receive blessings and initiate the festive joy that culminates in the announcement of Christ's resurrection on Sunday.

Ethnicity at Easter also finds expression through egg decorating. Though commercial dyes for eggs have long been available, people—especially from eastern European heritages—may still decorate eggs in traditional ways. Polish Americans, for example, begin by drawing a design incorporating the phrase “Happy Easter” (which requires sixteen letters in Polish) on an uncooked egg. Boiling die egg with purple

or brown onion skins fixes the design. The eggs, called *pisanki*, provide the symbolic main course for Easter dinner and figure in a friendly competition. When two persons hit the ends of their *pisanki* together, the person whose egg remains intact wins the opponent's cracked egg.

Other decorative traditions that figure into American Easter observances include displays of greenery and flowers, which, like bunnies and eggs, reflect the day's religious significance and its relationship to the birth imagery of spring.

Eaton, Allen (1878–1962)

Leader in the handicrafts movement in the United States in the early 20th century. Eaton organized many important exhibits of arts and crafts and wrote what remain the definitive studies of craft work in the United States before 1935. In the 1920s, Eaton worked with the Russell Sage Foundation and the American Federation of Art designing a series of exhibits on the arts and crafts of the homelands of Europe, which led to his book *Immigrant Gifts to American Life* (1932). Eaton then turned his attention to the crafts of the southern Appalachian Mountains, helping organize the Southern Highland Handicraft Guild and producing his most widely known book, *Handicrafts of the Southern Highlands* (1937).

Prior to his full-time involvement in craft work, Eaton served four terms in the Oregon House of Representatives and was an arts educator on the faculty of the University of Oregon. In 1917 Eaton was forced to resign from the university for his association with a pacifist group thought to be proGerman and disloyal to the American war effort. Many believed that Eaton was the victim of mass hysteria and intolerance. This event catapulted him into his zealous support for the artistic expression of unsung, denigrated, persecuted groups throughout the United States. During World War II, for example, he studied the art of Japanese citizens in internment camps, resulting in his book *Beauty behind Barbed Wire: The Arts of the Japanese in Our War Relocation Camps* (1952), published after his retirement from the Russell Sage Foundation in the late 1940s. Eaton was working on another book when he died in 1962.

Eaton elevated the level of public discourse about folk art in the United States, helped forge a more democratic and culturally plural concept of art, and prodded the government and other important social institutions to be more culturally egalitarian.

Eckstorm, Fannie Hardy (1865–1946)

Collector of Native American and Anglo American folklore. Eckstorm was born in Brewer, Maine, in 1865, educated at Abbott Academy and Smith College, and spent most of her adult life exploring aspects of Maine history and culture. Her research and publications on the social, cultural, and linguistic history of the state led her to be regarded as an authority on Native American lore, language, and natural history, lumbering life in northern Maine, and the Anglo American folksong traditions of Maine.

Eckstorm wrote extensively on Native American history, legends, and material culture, especially on the Penobscots of Maine. With a particular interest in Maine Indian nomenclature, she published *Indian Place-Names of the Penobscot Valley and the Maine*

Coast (1941). Her articles and lectures on Native American culture culminated in the publication of *Old John Neptune and Other Maine Indian Shamans* (1945).

Eckstorm's interest in life in the Maine woods—particularly the life of the river drivers who worked for the lumber industry along the Penobscot River—provided the impetus for *The Penobscot Man* (1904) and *David Libbey: Penobscot Woodman and River-Driver* (1907).

In the 1920s, Eckstorm began an active period of song collecting. She contributed to *Songs and Ballads of the Maine Lumberjacks* (1924) and to *The Maine Woods Songster* (1939), both edited by Phillips Barry, and she was coauthor of *Minstrelsy of Maine* (1927) and *British Ballads from Maine* (1929). Her collections preserved both British- and American-derived ballads and songs found in family traditions of the 19th and early 20th centuries.

In 1930 Eckstorm and Phillips Barry founded the FolkSong Society of the Northeast. She contributed to nearly all of the twelve volumes of the *Bulletin of the Folk-Song Society of the Northeast* during its eight-year existence (1930–1937) with articles providing interpretive and analytical information on songs. Fannie Eckstorm died in 1946 at age 81 in Brewer, Maine.

Eddy, Mary O. (1877–1967)

Folksong collector and researcher. Born in Wayne County, Ohio, Eddy grew up in Perryville in Ashland County, where her maternal ancestors had been early settlers. She graduated from Wooster College in 1898 and taught high school in Canton, Ohio, for many years.

As a graduate student at the University of Chicago from 1915 to 1917, she took Albert H. Tolman's course on "Ballad and Epic Poetry" and discovered that she could contribute significantly to his collection of ballads and folksongs. At first among family and friends in Perryville and later through her students in Canton, she began her major collection of the traditional songs of northern Ohio, at first only as a contributor to Tolman. In an article published in 1916 in the *Journal of American Folklore (JAE)*, Tolman attributed several of the ballads to Eddy, and in the 1922 *JAF*, in an article prepared in 1917 that took up the whole October–December issue, he listed her as joint author, noting that most of the songs and almost all of the airs had come from her and calling attention to her efforts to collect "all the folksongs surviving in tradition in the state of Ohio."

Following Tolman's death in 1928, his papers and manuscripts were scattered, but Eddy continued working on her collection. In 1934 or 1935, she sent her manuscript to Harvard University English professor and folklorist George Lyman Kittredge, but it was returned unopened. She published *Ballads and Songs from Ohio* at her own expense in 1939. Representing the song literature collected in a limited geographical area over a long period of time (and including some pieces from scrapbooks and other written sources), *Ballads and Songs* was praised at the time of its publication for its many fine airs and meticulous editing.

The published collection did not contain all of the songs Eddy had found. A copy of an early manuscript in two volumes in the John H. White Collection at the Cleveland Public Library, and of its "Supplement Number I" in the Houghton Library at Harvard, constitute a more complete collection. Eddy continued her research in folksong and published a number of articles on hymns and broadsides in the 1940s and 1950s.

Education, Folklife in

Programming of folklife-studies and folk-arts presentations in elementary and secondary schools. There are four essential approaches to folklife-in-education [FIE] programming: (1) in-residence projects coordinated by a folklorist, (2) seminars for schoolteachers, (3) production of educational materials, and (4) assembly programs or field trips featuring traditional culture. Recently, academic interest in folklife in education has focused on its role in cultural conservation, theories of learning, multicultural education, and educational reform.

Despite the variety of forms of FIE, there are common incentives for incorporating folklife studies in curricula; many children are interested in folklife for the same reasons adults are. They enjoy learning about family history and sharing family traditions. They value the study of local history and culture. They appreciate the opportunity to hear music that is rarely heard in commercial venues and to see artists whose work is often unknown to the wider community. Many students also recognize the appeal of a conversation with a talented, knowledgeable person. Folklorists have responded to these interests through FIE programs that introduce students and teachers to valuable education resources that are readily available but often overlooked.

Professional folklorists began working in school systems in 1976 through grant support from the folk-arts program of the National Endowment for the Arts (NEA). Modeled after artist-in-education programs developed by the NEA, these in-residence projects allow folklorists to research a community's folk culture, then present the local traditions and tradition bearers to students. Through programs across the nation, folklorists have coordinated performances and demonstrations by tradition bearers, thereby providing many students with their first exposure to old-time fiddling, Japanese origami, traditional boat building, and hundreds of other traditional activities. FIE programs have evolved from show-and-tell presentations by local folk artists to sophisticated projects that use folklife as a resource for teaching many facets of a school's curriculum.

Teachers have used folklore in their classrooms independent of FIE programs. Notable was Rachel Davis Dubois, who developed a program of "intercultural education" during the 1920s. Her approach focused on studies of immigrant and ethnic groups through research on ethnic culture, assembly presentations by tradition bearers, field excursions by students, and student presentations of their research. Another success is the Foxfire Project created by B.Eliot Wigginton in 1967. His Rabun Gap High School students researched the local traditions of north Georgia and published the magazine *Foxfire*, eventually amassing enough material to publish the *Foxfire Book Series*. The project has continued to grow, and the Foxfire Fund supports an array of programs, including the Skyline Teachers Network, an approach allowing teachers in urban schools to adopt the Foxfire methods.

Methods and theories from FIE programs have inspired teachers across the nation to use folklife in their instruction. Consequently, various folk-arts agencies offer seminars and workshops that train teachers to incorporate folklore in lessons. Seminars sponsored by the Smithsonian Institution, the National Endowment for the Arts, and state folk-arts programs have covered topics from Native American folk culture to the folklore of

schoolchildren. Although teachers regularly give these projects highly positive evaluations, few folklorists have advanced to the next step of establishing academic positions for folklorists in colleges of teacher education.

Folklorists have long recognized that school districts provide an incredible potential audience for the materials they produce, and a wide variety of curricular resources awaits wider distribution. Many of these resources have been developed within FIE programs, and various journals and newsletters routinely publish bibliographies of teacher guides, curriculum resources, film and video productions, recordings, and learning kits. Although the market for folklorists' media and instructional materials is growing, many of these resources have been lost in the overload of educational materials distributed to school administrators and teachers.

Recognizing both the educational setting and the potential audience that schools provide, folklorists have developed a final approach to FIE programming: school assemblies for folk performers and field trips to public events. Deemed attractive and cost-effective to school administrators, these programs have perhaps served the largest number of schoolchildren. Students regularly attend children's days at folk festivals, and many schools are venues for traditional musicians. Although this type of programming provides many students with their first exposure to public folklife programs, the educational impact of the hit-and-run approach is limited. A folklorist's interpretive comments can appear overly pedantic, and teachers often find it difficult to introduce the event to the students in a meaningful manner because they have little exposure to folklife studies. A critical evaluator would find it disconcerting that this form of FIE programming is the only one that receives its primary funding from the school system rather than from grants or financial support from a folk-arts agency.

As FIE projects and approaches are continually developed and refined, researchers have begun to examine the value and benefits of continuing folklife studies in the classroom. The vital need for FIE projects becomes increasingly evident, for research has shown FIE's value to the field of folklore and to the educational community. FIE emerges as a valuable resource for multicultural education and as a vital agent for cultural conservation. Educators have noted FIE's value for enhancing language-arts instruction and its importance to art and music education. Both folklorists and educators are studying how the discipline's methodology can serve as an aid to instructional techniques.

Many folklorists working in FIE programs have become acutely aware of the cultural basis of education and have begun studying the worldview of the educational community itself. Although the transmission of culture through formal education appears antithetical to a folklorist's interest, folklorists' perspectives and skills prepare them to examine social and political implications of education. Developing and continuing the dialogue between folklorists and educational theorists could greatly enhance both fields of study. Folklorists have much to learn from educators, and folklorists' perspectives, methods, and theories have great potential for developing innovative approaches for improving children's education.

Elvis (1935–1977)

Elvis Aaron Presley, “The King” of American rock and roll. His performance style evolved from its roots in Southern rhythm and blues music, heard in such tunes as “Hound Dog” and “Blue Suede Shoes,” to the “crooning” sound of a Las Vegas show singer, as in “Love Me Tender.” Viewed by many as a uniquely American folk hero, Elvis was regarded during his lifetime as the embodiment of the traditional Horatio Alger “rags to riches” success story with strong Robin Hood overtones. He rose above his childhood poverty in the South to become a worldwide musical sensation and a B-movie star,

*Elvis Presley in "Jailhouse Rock."

lavishing gifts of cars and jewelry on his family, associates, and fans.

While the process of heroic creation was begun during his lifetime through favorable media accounts and careful publicity that emphasized his devotion to family, country, and

God, the most defining element in the reshaping of Elvis from star to American folk hero came with his unexpected death in 1977 at his home of Graceland in Memphis, Tennessee. Tens of thousands of fans went to mourn and continue to do so, making Graceland the most visited home in the United States after the White House (Gregory and Gregory 1992:219). His death not only revealed an attention and devotion that is unsurpassed, it stimulated a recasting and a retelling of his life story with the imputation of greater deeds and the expurgation of lesser ones. Furthermore, traditions have developed that, along with King Arthur, Barbarossa, and the Magyars, Elvis is not dead. This belief, largely supported by the tabloid press, rests on traditional American beliefs surrounding the misspelling of a name on a gravestone, mysterious phone calls from Elvis to various fans, and the numerous accounts of “Elvis sightings” in malls, burger restaurants, and airports throughout the United States. These sightings have become a stock motif for comic strips, comedy routines, and television shows.

Perhaps the most culturally revealing aspect of the Elvis phenomenon however, is his posthumous rise to become a semireligious figure. This deitific regard can be seen in the language followers use to describe Elvis and their feelings about him, the reverence with which they flock to Graceland, and the tales that recount his healings of illness, blindness, and sorrow through dreams and his music. The inscriptions written on the wall surrounding Graceland best sum up this quasireligious quality Elvis has achieved in American culture: “Elvis, we believe always and forever”; “Elvis, you are my God and my King”; “Elvis, every mountain I have had to climb, you carried me over on your back.”

Many theories—ranging from postwar feelings of alienation from government and religion to the growing voice of discontent of the baby-boom generation—have been presented to explain this phenomenon. The fundamental question of why society chose Elvis above other famous and lost figures of the same period like Marilyn Monroe and James Dean, however, remains unanswered. In the years following his death, Elvis Presley has become a folk hero backed by a large body of modern American legend, song, iconography, and humor.

Empowerment

A process of enablement or permission in which power is given by those who have it to those who do not. The term emanates from social and economic theory rooted in Marxist thought. In the 20th century, following from the writings of educators like Paulo Freire and postmodernist thinkers like Foucault and Habermas, the term has also become common in culture theory. Empowerment in the context of folklore studies implies a revolution against the cultural domination and economic exploitation practiced by popularizers, critics, scholars, dealers, and collectors who claim authority as “legitimate” interpreters of folk culture. It further implies a return of cultural authority and even, at times, economic and political power to the “disempowered” folk.

The notion that the folk have been disempowered or effectively stripped of control over their own cultural traditions rests on several assumptions. First, the collecting, anthologizing, museumizing, or otherwise commercializing of folk art and lore by the dominant culture involves a removal of these forms of expression from their proper context and function in the folk community. Second, in decontextualizing and appropriating the material products and performance traditions of the folk minority, the dominant culture reinterprets, redefines, and often alters these forms, both in content and value. Third, the dominant culture thus asserts its hegemony over both the products and the producers through an institutionalized process of patronage and assimilation of folk traditions into the popular and elite traditions of the dominant society.

Misperception and misrepresentation play important roles in disempowerment. When mass-produced andirons depicting George Washington are termed folk art solely because of their relative antiquity or association with our “national heritage” there is an implicit assumption that collectors and critics can “discover” folk art in the absence of any identifiable folk. When New Mexican *santos* are sold and collected as “primitives,” their original significance as devotional objects is diminished. Such distortions signal a failure to reference folk groups or a tendency to deem their intentions irrelevant, thus giving primacy to the “aesthetic” of the dominant culture.

Empowerment advocates call for a democratization of culture through the transfer of power and cultural authority from the holders of cultural capital to the producers, the folk communities themselves. Commentators such as Kenneth L. Ames (1977), Nelson Graburn (1976), and Sally Price (1989) have shown how hegemonic forces influence not only the appreciation, but also the production, of folk art. They have maintained that cultural products cannot be understood independent of their function within the folk community of their provenance and that such communities are the true arbiters of the value and meaning of those products.

Empowerment advocates have also asserted that an empowered folk should exert considerable control over how their art is defined, displayed, and marketed, and that folk communities should be the beneficiaries of any cultural or economic capital generated through the exchange of their literary, musical, or artistic work with the dominant culture. This aspect of empowerment is perhaps most concretely realized in an activist strain of folklore studies known as the public-folklore movement. Public folklorists have emphasized not only the preservation of traditional arts and practices, but also the continued support of folk communities, even as these communities are transmuted by

changing social, economic, and political realities. Though wary of the effects that their intervention as interpreters and advocates may have on the artists and their art, public folklorists work through government and other organizations to provide advice, awards, and opportunities to exhibit.

The career of Louisiana cane carver David Allen offers an example of empowerment in public folklore. With the help of folklorist Susan Roach, this artist rose from local to national recognition largely through presentations at folk festivals such as those sponsored by the Louisiana Folklife Program and the National Endowment for the Arts. Through his eventual participation in the National Folklife Festival, Allen came to recognize the monetary and cultural worth of his work and his own membership in a community of African American carvers. This elevated status and self-esteem worked changes in Allen and his art, but it also provided him with the means and motivation to explore his craft and perpetuate it through teaching.

While the cry for empowerment of the folk may be construed as humanistic in its emphasis on the makers rather than the made, it may also be seen as condescending because it assumes that folk traditions do not have the vitality to survive in and of themselves but must be rescued by advocates from the academic or cultural elite. Perhaps in response to this implication, the term "self-empowerment" has come into use. Self-empowerment implies that the disempowered can empower themselves by recognizing and asserting their own selfworth and by refusing to accept the imposed "authorized" or "canonical" version of the meaning of their own cultural products.

Emrich, Duncan B.M. (1908–1977)

Folklorist. Although he wrote many articles and eleven books on folklore, Emrich is best remembered in folklore circles for the decade he spent as head of the Folk Song and Folklore Archives at the Library of Congress in Washington, DC. Born in Turkey to missionary parents, he moved with his family to New England during World War I. Emrich won a scholarship to Phillips Exeter Academy and went on to receive college degrees from Brown, Columbia, and Harvard Universities, and the University of Madrid. At Harvard he studied under the noted scholar George Lyman Kittredge. After receiving his Ph.D., Emrich began his teaching career at Columbia. Three years later, he moved to the University of Denver, then in 1943 he entered the U.S. Army. He worked in Army Intelligence, won a Croix de Guerre for his action in France, and, as a member of General Dwight D. Eisenhower's staff, prepared an account of the war in Europe.

After the war, Emrich moved to Washington, DC, where he became head of the American Folk Song and Folklore Archives, a position he held until 1955. After that he served as a cultural affairs officer at American embassies in several countries, including Greece and India, frequently collecting folklore in his spare time. In 1966 Emrich returned to Washington as an officer in the United States Information Agency. In 1969, after a twenty-six-year hiatus, he returned to the classroom as adjunct professor of American folklore at American University in Washington. There in 1976 he established a fund to support an annual lecture series. At the time of his death the following year, he was, coincidentally, working on a book on the folklore of death.

Emrich was a collector, compiler, and popularizer of folklore rather than a theorist. These approaches are seldom appreciated by scholars, especially those who regard theorizing as the only acceptable way to treat folklore. But the negative reviews many of his books received were not wholly attributable to lack of theory; there were some genuine problems with Emrich's publications. For example, he rarely distinguished between items from folk tradition and those from popular culture, since he reasoned that popular-culture materials had undeniable appeal to the folk and thus rightly belonged in books on folklore. Moreover, Emrich thought that the inclusion of such material made his books more interesting to the general public, and he considered that audience just as important as the scholarly one. Whatever their flaws, volumes like Emrich's *American Folk Poetry* (1974) and *Folklore on the American Land* (1977) introduced folk traditions to many people who had never before opened a book about folklore.

Epitaph

Inscription on a tombstone. The custom of inscribing tombstones came to the United States with European settlers. Typically, gravemarkers are artifacts with both visual and verbal components that together not only comment about the deceased in particular or death in general, but also make general observations reflective of cultural attitudes toward dying and death. Students of funerary art and customs commonly distinguish between the visual elements and verbal inscriptions and refer to the latter as epitaphs.

The comparative study of epitaphs found on American gravemarkers provides insights into collective attitudes toward death. The most simple include the name (or initials) of the deceased and often the date of death. These modest inscriptions function minimally to identify the deceased and to perpetuate his or her memory.

The occasion of erecting a graveyard monument provides survivors with an opportunity to inscribe additional comments. The earliest tombstones followed funerary custom that required the inscriber to include in addition to the name and age of the deceased, something about the dead person's position in life, the manner of his or her death, and some praiseworthy quality or deed. It was not uncommon that the tombstone was embellished with symbols of death, sometimes arranged to frame the epitaphs. As the spirit of egalitarianism grew in America, epitaphs changed. Formulaic expressions of loss and salvation appeared with increasing frequency. They range from verses drawn from scripture or other devotional texts ("I am the resurrection and the life"), to short prayers ("May she rest in peace," sometimes abbreviated to R.I.P.), terse expressions of grief ("Gone, but not forgotten"), succinct statements about the deceased's position in life ("Loving husband"), and bleak admonitions about death ("As I am now, so you must be/Prepare for death and follow me").

Originality is not an imperative for epitaphs. By the late 18th century, booklets with epitaphs suitable for every occasion were marketed to memorial inscribers. These and more elaborate and less formulaic epitaphs continue to provide extended discourses on the value of life and the inevitable reality of death. Those with a religious theme point to salvation in the next world for the righteous and condemnation for the evildoer.

For some people, ready-made inscriptions could not reflect their appropriate, personalized sentiments. They sought to capture in original epitaphs something about the life of the deceased. Thus we find an inscription such as this one on the gravestone of a Milford, Connecticut, minister: "During his ministry/He enjoyed 7 revivals/Admitted 716 members/ Baptized 1117 and/Buried 1126 of his flock." Other epitaphs explain the circumstances that caused the death. Consider this inscription on the tomb of a Pelham, Massachusetts, man whose wife poisoned him: "Think my friends when this you see/How my wife hath dealt by me/She in some oysters did prepare/Some poison for my lot and share/Then of the same I did partake/And nature yielded to its fate." One young lady's accidental death prompted this epitaph: "Ellen Shannon/Who was fatally burned/March 21, 1870/by the explosion of a lamp/filled with 'R.E.Danforth's/Non-Explosive/Burning Fluid.'"

Humorous epitaphs have attracted particular attention and have been the bases for a number of regional epitaph collections. In Enosburg, Vermont, the grave of Anna

Hopewell reminds all visitors: "Here lies the body of Anna/Done to death by a banana/It wasn't the fruit that laid her low/ But the skin of the thing that made her go."

Until recently, research into American epitaphs has been most intense in New England, where elaborate and simple gravestones dating back as far as the earliest colonial settlements survive relatively intact. By examining them chronologically, scholars have gained some insights into changing attitudes toward death and religion. Isolated collections of epitaphs found in other parts of the country can be found in regional journal articles.

Esoteric-Exoteric Factor in Folklore

A concept introduced by American folklorist William Hugh Jansen in 1959 to characterize the ways that folklore expresses attitudes about group traits and reveals the dynamics of intergroup perceptions and beliefs. The *esoteric* factor consists of a group's folklore about itself and what it supposes others think of it. This would include, for example, the traditional narratives, beliefs, and jokes expressed by group members that depict the group's self-image and perceived traits (such as pride, independence, or frugality), as well as what group members assume outsiders think of their group ("They think we are arrogant, aloof, and stingy"). *Exoteric* folklore consists of the ideas and images that one group has about another group—for instance, stereotypes and *blason populaire* (traditional slurs). It also includes what one group "thinks that other group thinks it thinks" ("They think that we all think that they are greedy and treacherous").

Jansen stated that esoteric folklore is based on the specialized knowledge of a group and serves to preserve that knowledge and strengthen a sense of group identity. Exoteric folklore, on the other hand, not only expresses intergroup conflict but may serve to define a sense of one's own group by contrasting "them" with "us." Jansen proposed four general "statements" about the esoteric-exoteric factor: (1) The smaller the group, the stronger the esoteric element in its folklore; (2) the more distinctive the group, the more likely the occurrence of exoteric folklore about it; (3) the larger and more self-confident the group, the weaker the esoteric element in its folklore; but (4) great size and self-confidence in a group are not necessarily deterrents to the development of exoteric folklore about that group.

Jansen's ideas about the esoteric-exoteric factor have been used primarily by folklorists interested in ethnic jokes and slurs, stereotyping, legends and rumors, and ways these expressions reflect intergroup dynamics.

Espinosa, Aurelio Macedonio (1880–1958)

Pioneer scholar of Spanish American and Spanish folklore and dialectology. A native of the San Luis Valley in southern Colorado and a multilingual academician, Espinosa initiated folklore and language study in Hispanic northern New Mexico and southern Colorado and did extensive work on Spanish folktales.

After receiving a University of Chicago doctorate in Romance languages and literatures with a minor in IndoEuropean comparative philology, Espinosa joined the Romanic Languages Department at Stanford University in 1910 and there did his influential teaching and prolific research until retiring in 1947. Beginning in 1902 and intermittently until the 1950s, he conducted folklore fieldwork in northern New Mexico and southern Colorado; as it was done in formerly Spanish, coastal California between 1911 and 1919; in Spain, during a 1920 expedition. Among the founders of the Societe Internationale de Dialectologie Romane (1909), the American Association of Teachers of Spanish (1917), and the Linguistic Society of America (1925), Espinosa was also active in the American Folklore Society, serving as president in the years 1923–1924.

A disciplined, language-oriented folklorist, Espinosa collected and published a variety of verbal genres from Hispanic America. He contributed to comparative ballad studies but accomplished most in folktale scholarship by developing a classification of Spanish folktales, tracing American ones' peninsular roots and Iberian ones' Oriental origins, and comparing them with other European and Native American traditions. Much contemporary criticism focuses on Espinosa's assertion of Spanish origins and hegemony for Southwest Hispanic folklife without adequate sociohistorical consideration of the region's complex, inter- and intracultural dynamics. Nevertheless, Espinosa is recognized as an exemplary linguist and literary folklorist who opened significant new areas of study.

Ethics in Folklore Research

A code of conduct for responsible and fair treatment of the human subjects of folklore research. As humanists and as social scientists, researchers in folklore have sought to gather significant information while respecting the integrity of their informants. This dual focus upon data collection and human rights has generated compelling ethical dilemmas. Regulations for the protection of human research subjects in the United States have been implemented since the late 1970s; nonetheless, fieldworkers have had considerable leeway to apply the dictates of their own consciences. Manuals for fieldworkers, from Kenneth S. Goldstein's *A Guide for Field Workers in Folklore* (1964) to Bruce Jackson's *Fieldwork* (1987), have placed increasing emphasis upon ethical issues. Primary concerns include the fieldworker's self-presentation, methodology, ownership of material, reciprocity, protection of informants' identities, and respect for sensitive issues.

Recent controversies on ethics have reflected evolving definitions of the folk. Cultural anthropologists and folklorists in the late 19th and early 20th centuries tended to view their informants as data sources quite different from themselves, requiring careful manipulation and propitiation. More recent researchers have tended to see their informants as fellow human beings who become partners in a shared fieldwork enterprise. As Robert A. Georges and Michael Owen Jones point out in their book *People Studying People*, "fieldworker and subject are first and foremost human beings" (Georges and Jones 1980:3). With this common humanity as a central premise, ethical considerations have become crucial for successful fieldwork.

Before fieldwork begins, the researcher must make choices that have ethical dimensions. Choices of subject, site, and informant population may involve consideration of sensitive social and political issues. The researcher's presentation of himself or herself to the group can be completely honest or somewhat manipulative. "Role-playing," sometimes recommended for folklore students, calls for introducing oneself as a "student," "teacher," "collector of local history," or other personage. While such a term may be accurate to some extent, it limits the informant's perception of what the researcher is trying to accomplish. If the chosen term is not accurate, it makes the researcher vulnerable to accusations of falsehood. As Bruce Jackson says, "getting the information isn't important enough to warrant going undercover and lying to people" (Jackson 1987:263).

How the researcher chooses to record information also has ethical implications. If handwritten notes are the chosen method, the researcher runs the risk of getting an incomplete or misleading version of what the informant said. While tape recorders are much more accurate, it is easy to conceal their usage; folklorists must think carefully about being open with their informants. Video cameras are less easy to conceal and are appealing because of the range of audiovisual information they capture. However, the collector may find that some informants are reluctant to give permission for its use, since visual images fully reveal one's identity. Obtaining permission for recording information is always important, no matter what method is used. At the time of the interview, Edward D. Ives recommends, the researcher should explain how long tapes will be preserved and what sort of access people will have to them, in an archive or otherwise. Getting a signed

release at the end of the interview is crucial, with any restrictions on future usage specified by the informant (Ives 1980:51).

The question of ownership has undergone much revision since folklore research began. Whether an informant ultimately owns the story, song, or joke he or she has shared with a collector and what the collector has the right to do with that material are complex issues. With recordings of traditional or semitransitional songs and music, debates about ownership have become especially intense. Litigation about ownership of the song of television personality Barney the Dinosaur, roughly based on the folksong "This Old Man," gained media attention in 1994. Ideas about ownership of traditional materials and their offshoots continue to evolve as precedents build in an increasingly litigious society.

Closely related to the ownership question is the issue of reciprocity. If informants indeed own their material, what sort of compensation should they receive? Judgments vary from Goldstein's preference for nonfinancial assistance and compensation for wages lost to Jackson's case-by-case determination of payment "on the basis of the relationships among the people involved, the money available, and the realities of the situation" (Jackson 1987:269). If the fieldworker makes a substantial sum of money from something that an informant provided, it seems only fair to share some of that money with the person who made it possible. However, variations in research situations have brought about many different responses to the payment issue.

Another aspect of fairness to informants is disclosure of their identities. Some folklorists prefer to use pseudonyms or just informants' first names, in order to protect their privacy. Others believe that pseudonyms are not sufficient to protect privacy, so other identifying details should be changed as well. The need for protection of informants varies according to the kind of material collected; for example, tellers of dirty jokes tend to be more concerned about being identified than sharers of traditions about the weather. No matter how innocuous the material may seem, researchers must be scrupulous about respecting the preferences of their informants. If no specific preferences are given, researchers simply use their best judgment. Jackson recommends that fieldworkers apply the Golden Rule, "Do unto others as you would have them do unto you," to all fieldwork questions that do not have a clear, immediate answer.

Yet another layer of ethical complexity comes from consideration of informants who cannot fully consent to sharing information. Children, for example, may enjoy telling dirty jokes to researchers but may then regret having done so when they are older. While parents have the legal right to give permission for their children to be involved in a research project, some advocates of children do not believe that this is fair. Mentally disabled individuals and others whose judgment is affected by illness or stress may not be able to give full consent either. Each researcher must decide how to handle such situations until litigation provides more definite rules.

As discussion of ethics continues, researchers develop guidelines for appropriate conduct. The drafting of a "Statement on Ethics" for the American Folklore Society in 1986 caused much debate. Although the resolution of many ethical issues is still unclear, it is quite clear that ethics will be a prime topic for folklorists' discussion in the future.

Ethnic Folklore

Traditional expressive behavior of ethnic groups as they migrate, resettle, and interact with other groups. In the late 20th century in the United States, the term “ethnic” is usually applied to foreign nationality or immigrant groups and is often extended to refer to American Indians, African Americans, and other racial groups, and sometimes to specific religious groups, irrespective of their national background. Initially conceived of as the content of a distinctive ethnic identity—part of the constellation of cultural traits that together distinguish one group from another—ethnic folklore is now generally defined in terms of its role in the creation, maintenance, and negotiation of cultural boundaries between groups. Such negotiation of group boundaries always involves the display of a range of shared cultural traditions, or folklore.

The folklore of ethnic groups has been a prominent concern of American folklorists since the inception of the American Folklore Society (AFS). In fact, the 1888 AFS charter mentions the traditions of American Indians, African Americans, and other ethnically distinct communities as particularly appropriate sources of data for folklorists.

Like their European precedents, the first studies of the folklore of American ethnic groups were collections of “survivals.” The assumption behind these collections of songs, stories, superstitions, and other Old World forms was that these treasures would somehow be lost as soon as acculturation (specifically, linguistic acculturation) had taken place. The task of the folklorist, then, was to document these Old World traditions before they disappeared during the process of Americanization. Initially, British ballads, songs, and folktales were the foci of such studies that concentrated on recovering these relics of British countryside traditions especially in the Upland South, New England, and the Ozarks. As Roger D. Abrahams has pointed out in his thorough discussion of the history of American ethnic folklore scholarship in the *Harvard Encyclopedia of American Ethnic Groups* (1980), a hierarchy of forms and even items was established in the late 19th and early 20th centuries, but actual collections of such items in North America wasn’t carried out extensively until the 1920s and 1930s. These collections, several of them conducted under the auspices of the Works Progress Administration (WPA), focused primarily on determining the oldest and most widespread texts of ballads and folktales and estimating how widely they might be found and in what range of versions and variants.

A wide range of ethnic-folklore research has been conducted employing this kind of antiquarian approach to the collection and analysis of ethnic lore of groups as diverse as Pennsylvania Germans, Louisiana French, and Southwestern Mexican Americans. Such studies have served primarily to document the conservative, traditional preservation of Old World ethnic traditions in these often isolated communities.

Studies of Native American folklore developed along somewhat similar lines. In the 19th century, the collection of Native American folklore, however, also was put into the service of developing a kind of nationalistic sentiment. Native American lore was collected in order to identify distinctly “American” cultural roots that might serve to distinguish the young nation. These collections soon provided indexes of the rate of

survival of Native American cultural forms, since, unlike the study of the folklore of Euro-American ethnic groups, there were no previous baseline studies of precontact narratives, songs, and rituals available.

Other scholars, particularly those studying Euro-American folklore, combined similar collecting techniques with a somewhat different analytic perspective. In these studies, the collected texts served as indexes not only of the degree of preserved ethnicity, but also of the degree of “assimilation” of the particular ethnic group. Conducted primarily in culturally conservative communities in which ethnic distinctiveness was highlighted, this kind of ethnic-folklore research compared the collected material to Old World repertoires in order to gauge the various stages in the process of acculturation. The clear assumption was that the more Americanized an individual ethnic group became, the fewer vestiges of Old World forms would remain, and, in time, ethnic differences in American culture would simply disappear. Following the work of early 20th-century historians and social scientists interested in ethnicity, then, folklorists viewed ethnic communities as living laboratories in which the processes of assimilation and acculturation could be observed and analyzed firsthand. Such studies served to highlight the selective maintenance of traditional forms and practices within particular ethnic communities.

A similar perspective also has been used to suggest, however, that African and American Indian repertoires or styles have been eliminated in the process of colonization. This deculturation perspective is most frequently identified with African Americanists E. Franklin Frazier and Robert Park, although it was maintained by other collectors of African American lore until well into the 1960s. Such a Eurocentric position has been easily rebutted by a number of prominent scholars who have demonstrated a strong maintenance of African expressive forms, styles, and performance patterns in the United States. The work of Melville Jean Herskovits (cf. Herskovits 1942) has been particularly influential in formulating a more complex model of the ways ethnic-folklore forms function as indicators of degree of acculturation. Herskovits distinguished three modes of continuity and adaptation: (1) straight *retention*; (2) *reinterpretation*, in which forms are maintained in new environments with new uses and meanings; and (3) *syncretism*, in which similar elements of two or more cultures merge. This attention to the cultural dynamics of intergroup contact in which expressive forms change and emerge redirected scholarly attention away from folklore items themselves and toward an analysis of the various factors affecting the use of these forms as displays of ethnicity.

Most 20th-century folklore studies on ethnicity have focused on the changes in ethnic groups and their lore that come about as the result of cultural contact. In his influential *American Folklore* (1959), Richard M. Dorson formulated a set of questions that served as guidelines for folklorists interested in the lore of ethnic groups for at least the next ten years: “What happens to the inherited traditions of European and Asiatic folk after they settle in the United States and learn a new language and new ways? How much of the old lore is retained and transmitted to their children? What parts are sloughed off, what intrusions appear, what accommodation is made between Old Country beliefs and the American physical scene? These are the large questions that confront the assessor of immigrant folk traditions” (Dorson 1959).

Many folklorists took up Dorson’s call for studies of immigrant traditions that would answer these questions. A fine example of such acculturation studies is Robert A. Georges’ work with the Tarpon Springs, Florida, Greek community in which he analyzed

the ways narratives, rites of passage, and holiday celebrations help to maintain the traditional belief system of these fairly isolated transplanted Greek fishermen. Georges demonstrated both the survival and the reinforcement of Greek traditions in this one small American community. Folklorists have continued to document both persistence and change in the ethnic traditions of immigrant groups. Barbara Kirshenblatt-Gimblett's study of traditional storytelling in a Toronto Jewish community, Robert Klymasz's study of Ukrainian folklore in Canada, and Elli KöngäsMaranda's analysis of Finnish American lore, for example, document the various factors effecting change in ethnic traditions in the New World.

European models of ethnological research have formed the basis for the "acculturation model" research of folklorists like Linda Dégh, who has called for case studies that will provide an analysis of the assimilation process as it affects groups in contiguous and intermittent contact over a period of time. This process of "cultural adjustment" requires the observation of transgenerational folkloric expression as various ethnic groups come in contact with one another. Dégh has continually suggested that the determination of ethnic boundaries and the examination of intercultural borrowing should be the focus of research on ethnic folklore.

In this insistence on the analysis of the process of ethnic interaction, Dégh's work (cf. Dégh 1975) is representative of the ways in which American ethnic-folklore scholarship since World War II has moved away from a concern with "survivals" of Old World forms as the cultural content of ethnic groups and toward an understanding of the processes of ethnic-boundary maintenance or negotiation. Like their European colleagues, American folklorists have drawn extensively on the work of Norwegian ethnographer Fredrik Barth in making this shift in theoretical emphasis. Barth's *Ethnic Groups and Boundaries* (1969) proposed an understanding and definition of ethnic groups based not on the identification of a cluster of culture traits for each particular ethnic group, but rather on the *process* that that group and others use to separate and define the group itself. Barth argued that the focus for the analysis of ethnicity should be "the ethnic boundary that defines the group, not the cultural stuff that it encloses." This simple but powerful notion of boundaries has proven to be one of the most theoretically useful in clarifying the ways in which ethnic identity is articulated and actively negotiated in interaction within and between ethnic groups. Such a perspective points clearly to the influence of contextual variability on ethnic identity: As social, economic, and political conditions change, so may systems of ethnic identification.

Attention to the role of folklore in the process of boundary making was first articulated by William Hugh Jansen in "The Esoteric-Exoteric Factor in Folklore" (1959). Jansen discussed the range of factors associated with boundary making and maintenance as they are revealed in oral narrative. His work suggests that by examining the folklore of a group's own self-image as well as that of its images of other groups, one might better understand the role folklore plays in the creation, negotiation, and maintenance of ethnic boundaries. While Jansen's work focused primarily on the ways in which folklore operates as a "function of shared identity," binding groups together, Richard Bauman has pointed out that differential identities and asymmetrical relationships can also be the basis for folklore performance (Bauman 1971). Américo Paredes, for example, has explored the relationship between "gringos" and "greasers" in the joking behavior of Mexican Americans as dramatizations of real social inequities. Roger D. Abrahams also has

suggested that folklore performances may additionally operate as a means of distinguishing separate or even antagonistic segments within the same ethnic community, as Alan Dundes' work on Jewish American humor demonstrates.

As members of ethnic groups negotiate the construction, manipulation, and exploitation of boundaries between themselves and others, they draw on a wide range of cultural and linguistic resources in multiple cultural repertoires. In her 1983 essay "Studying Immigrant and Ethnic Folklore," Barbara Kirshenblatt-Gimblett suggested that a special feature of the folklore of ethnicity is a heightened awareness of cultural diversity and self-reflexivity so that the relevant research questions become: "To what extent, how, and to what effect is folklore used to make cultural comparisons and to mark cultural distinctiveness? How is folklore used to define cultural differences, incongruities, and convergences? What are the nature and content of these comparisons, of this marking or foregrounding?" Attention to these questions required a shift from studying the lore of a particular named group to an examination of the settings, social occasions, and events in which boundary negotiation is an important activity.

Clearly, this shift in focus was at least partially a response to the new attention to folklore performance in the late 1960s and 1970s. With Dan Ben-Amos' 1971 redefinition of folklore as patterned expressive communication within a group meeting together face-to-face came an emphasis on the folk *group* rather than on solely text-centered analyses, and on the folklore *process* rather than product. For scholars interested in ethnicity, this particular theoretical move opened the discipline in new ways to serious considerations of the ways in which ethnic-group members used folklore in the creation and maintenance of cultural boundaries. In addition, the concept of emergence—that folklore forms, contexts, and performances are constantly emerging—proposed by Dell Hymes and Richard Bauman, helped to undermine the long-held assumption that ethnic folklore traditions gradually and inevitably erode and disappear. Instead, folklorists now focused their attention on the creative, ever-changing ways in which ethnic groups and individuals display their own ethnic identities.

At the same time, rising ethnic consciousness within the United States in the 1960s and 1970s created an increasing public interest in understanding the dynamics of ethnic inter-action. Folklorists sometimes found themselves in the position of "ethnicity brokers" as they became involved in the public display of ethnicity in a variety of festival settings ranging from the Festival of American Folklife in Washington, DC, to small, local gatherings. Such festivals became means of dramatizing ethnic persistence in a particular region or community. The process of "going public" raised a whole new set of questions for both folklorists and members of ethnic groups such as: What happens to folklore forms when they are performed within large heterogeneous groups that have come together only to be entertained rather than within close, face-to-face, homogeneous communities with shared cultural values and expectations? What happens when ethnic identification becomes marketable? What is the effect on the ethnic community itself? Is the social base of ethnic folklore completely undermined in such performance contexts? Or are these festival situations simply different occasions on which boundary negotiation takes place, new responses to ethnic persistence in a truly pluralistic society?

During the late 1970s and 1980s American folklore scholars began to extend their analyses of ethnic groups and their lore in taking account of the wide variety of contexts in which ethnicity is constantly negotiated and renegotiated. Many of the articles in the

1977 special issue of *Western Folklore*, "Studies in Folklore and Ethnicity," edited by Larry Danielsen, demonstrate this range of concerns.

Acknowledging that ethnic meaning arises only out of the social interactions of individuals whose expressions of ethnicity may be affirmed, contested, and/or celebrated by other participants, researchers began to examine the interactions of particular ethnic individuals. As Shalom Staub has pointed out in *Yemenis in New York City*, "ethnicity is therefore an identity which resides not within the individual person, or even the particular group, but *between* individuals and *between* groups engaged in social interaction." The 1991 collection of essays on ethnic folklore edited by Stephen Stern and John Allan Cicala, *Creative Ethnicity: Symbols and Strategies of Contemporary Ethnic Life*, is representative of this new direction in ethnic-folklore scholarship. Through an examination of the forms, symbols, strategies, and stylistic resources of the folklore performances of a variety of ethnic individuals and groups, the authors attempt to demonstrate the richness and diversity of ethnicity as it is experienced on a dynamic, personal level.

Scholars interested in the folklore of ethnic groups no longer confine themselves to the task of documenting survivals and chronicling acculturation patterns. Instead, folklorists around the world are attempting to take into account both the broad historical conditions that influence ethnicity as well as the factors affecting specific individual negotiations of ethnic identity as they are played out within particular social interactions. The analysis of creative expressions of negotiations of ethnicity is crucial to an understanding of the ways in which groups and the individuals who comprise those groups continually articulate and reshape the meaning of their own ethnic identifications.

Ethnic Stereotypes

Conventional, formulaic, oversimplified conceptions of a group. The noun “stereotype,” in this sense, was first used by journalist Walter Lippmann in his *Public Opinion* (1922). Since then it has been employed by all manner of writers, particularly sociologists and psychologists. The word “stereotype” originated in the printing trade, where it refers to a metal plate that reproduces the original exactly. Combined with the adjective “ethnic,” it has served when the older “nationality,” “race,” or “immigrant” was no longer considered adequate.

Ethnic stereotypes, some inaccurately called “stereotypical slurs,” deal with images of reality rather than reality itself. They are the verbal and graphic images of crafty Chinese, beerswilling Germans, fighting Irish, gesticulating Jews, watermelon- and chicken-stealing African Americans, and lazy Mexican Americans, among others, that have peopled the magazines and stages in American humor and entertainment of the 19th and 20th centuries. Because of the presence of a slight kernel of truth in some stereotypes, any joke alluding to this truth might not please a member of such a group.

Examples: The countless jokes about Scots and Jews may well refer to a commonly observed quality of both people called “thrift,” normally deemed a good quality. At what point does thrift become stinginess? And who is the judge? The countless unkind jokes about stinginess may reflect a genuine concern with thriftiness, not a negative quality.

A typical single-group stereotype about Irishmen is: “Whenever there are four Irishmen, there is bound to be a Fifth,” alluding to the alleged penchant of the Irish for drinking. Multigroup international stereotypes or slurs usually single out only one trait for each nation.

The crossbreed riddle is another type of international double-slur joke: “What do you get when you cross an Italian with a Mexican?—A gangster on welfare.”

Stereotypes stem from the historical and cultural experience of groups, are highly inaccurate, yet generally are, or *were*, based on a smidgen of truth. To ignore such realities can be as bad as exaggerating or denying them.

Not all stereotypes are negative; some are quite complimentary. “The French are great lovers” and “The Chinese are courteous” are samples of stereotypes reflecting well on people. However, they are equally exaggerated generalizations and should not be accepted as the unqualified truth.

Groups also create, or at least contribute to the longevity of, their own stereotype. The Irish are known for praising their own ability to make good politicians. Jews at first did their part in inventing the stereotype of the “JAP,” the “Jewish American Princess.”

Frequently, the negative import of the joke is determined by who utters the negative item to whom, and who is present. A self-deprecation joke told in the presence of only in-group members becomes a serious insult if told by an outsider or stranger.

Our ideas about stereotypes come not from actual, prolonged contact with other people, but from the stereotypes we learn about them, and these stereotypes are based on folklore—from proverbs, songs, jokes, and other traditional forms.

Stereotypes change slowly in response to altered perceptions, some taking on almost opposite meanings from their original stance. Israeli Jews have moved from reluctant soldiers to bloodthirsty fighters, and the new German stereotype does not depend on beer and *Gemühtlichkeit* as much as the old one did.

Ethnomusicology

Holistic study of the world's music, primarily from a cognitive, stylistic, performative, and contextual viewpoint. The Dutch scholar Jaap Kunst coined the term "ethnomusicology" in 1950 in order to displace the earlier "comparative musicology," his reason being that the field did not *compare* more than any other. The "ethno-" prefix, however, has been a source of debate. It suggests the study of "ethnic" music other than that of the West, and scholars in Third World areas (for example, sub-Saharan Africa) that have complex unwritten traditions rightly prefer "musicology" for the study of their own music. Despite these problems, the term has been adopted throughout the world, displacing even the German *Musikethnologie* or the French *ethnographie musicale*. This is due primarily to the influence of North American scholarship, which has emanated from the Society for Ethnomusicology, founded in 1955 and its journal, *Ethnomusicology*. The earlier International Folk Music Council (IFMC) in London founded in 1949 (since 1980 renamed the International Council for Traditional Music, or ICTM) displayed in its original title the influence of scholars such as Belá Bartók and Cecil Sharp at the turn of the 20th century. Ethnomusicologists, however, had come in the 1960s to consider folk music suspect as a descriptive category. This was largely because they found the terminology inappropriate for small-scale, Third World societies, but they also attacked it increasingly for its idealized character, and the term gave way to the more neutral "traditional music."

Ethnomusicology (and before 1950, comparative musicology) has normally meant the study of musical traditions outside the Western world. But recent work includes historical and written traditions, within and outside the West, using documentary resources that include sound in addition to writing. More immediately, ethnomusicology in the 1990s involves the study of music as a human activity and thus subsumes all musical traditions, especially living traditions, regardless of geographical area. The African musicologist J.H.K. Nketia has described it quite simply as "a discipline which combines formal and contextual techniques in the scholarly study of music" (Kwabena 1990). The main paradigms in theory and method have come from anthropology and musicology, and the evolution of the discipline has closely paralleled that of anthropology (and folklore when complex societies are involved). Among terms that have been closely linked to the history of both comparative musicology and ethnomusicology in the 20th century, for example, are "*anthropology of music*," "*musical ethnology*," "*musical ethnography*," and "*musical folklore*." Work in psychology, sociology, linguistics, art, dance, and literary criticism has also contributed to the interdisciplinary character of ethnomusicology.

Like folklorists, however, ethnomusicologists can argue that their subject is a discipline rather than a field simply because of its intensive production, over more than a century, of published work that fuses different strands or approaches in

analyzing the central subject matter. While 19th-century scholars such as Guido Adler saw comparative musicology as a subfield of musicology (Adler 1885), many scholars would now reverse this Eurocentric view of ethnomusicology given the rise of popular and especially African American musics, rapidly changing demographics, the crisis in Western art music's harmonic language, and the downturn in the academic demand for musicologists. Ideologically, too, ethnomusicologists tend to reject the assumption that Western music is superior to other kinds. This has to do with their generally egalitarian

stance, as a result of which, like many anthropologists and folklorists, they have pointed to the ethical dilemmas of studying the “exotic” other.

Work in ethnomusicology since 1970 has focused on two kinds of problems affecting musical traditions in the past and the present: (1) musical thought and behavior in spe-

cific and often remote, small-scale cultures; and (2) music whose nature has been affected by change of context, tourism, or ideology, or by other factors such as the mass media and the cassette industry. The first kind of study is guided principally by the methods of cultural anthropology or folklore; the second, more by sociological analysis and crosscultural explanation in aesthetics or semiotics. A third kind of problem involves music learning and perception and is based in the methods of cognitive anthropology or

cognitive psychology. All of these approaches have been informed at a deeper level by developments in critical theory (sociology), cultural praxis (anthropology), and hermeneutics (philosophy).

The 18th-century antiquarian interest in cultural evolution that led to the founding of folklore and anthropology as fully fledged disciplines in the 19th century also spurred curiosity about musical behavior. Numerous early collections of “exotic” music were made: Chinese, Canadian Indian, and Finnish examples appeared in Rousseau’s *Dictionnaire de musique* (1768). Father Amiot, working as a missionary in China, translated old Chinese musical treatises in his landmark *Mémoire sur le musique des chinois* (1779), and William Jones, an English High Court judge in Calcutta, published a work on the modes of Hindu music (1784). Important sections on indigenous music, drawn from field observation and relatively free from Western bias, were contributed by the French scholar Guillaume-André Villoteau to the twenty-five-volume *Description de l’Égypte* (1809–1826). F.J. Fétis’ *Histoire générale de la musique* (1869) was the first history to insist that music outside the Western tradition, including that of China, Japan, India, and Siberia, should be represented.

By the 1880s, investigation of musical traditions both within and outside the West was given impetus by the invention of the phonograph in 1877. Recorded music could now be played back repeatedly for the purposes of study. This period, then, brought forth publications that were to be highly influential: for instance, A.J.Ellis’ “On the Scales rioid, then, brought forth publications that were to be highly influential: for instance, A.J.Ellis’ “On the Scales of Various Nations” (1885), which proposed dividing the equal-tempered halftone into 100 parts called “cents” in order to make possible the precise comparison of different tonal systems. In the same year, the Viennese scholar Guido Adler prescribed an outline for the scholarly study of music, in which “comparative musicology” was to bring together “the sound products, especially the folksongs of different peoples, lands and territories for the purposes of ethnographic ends, and to group and divide them according to the difference in their nature.” In 1886 the German scientist Carl Stumpf published his study, with transcriptions made by ear, of the music of the Bella Coola Indians of British Columbia, a group of whom had visited Germany in the previous year.

With the invention of the phonograph, scholars were able to gather data on musical traditions and to study them intensively. Jesse Walter Fewkes recorded Passamaquoddy and Zuni Indians in 1890, and the songs of the latter were transcribed by Benjamin Ives Gilman and published in the *Journal of American Ethnology and Archaeology* (1891). Europeans were not slow to see the potential of the phonograph, and Béla Vikár (1896) and Evgenija Linyova (from 1897) made field recordings of folksongs from rural peasants in Hungary and Russia, respectively. Later collectors found the phonograph indispensable: Zoltán Kodály (1905), Béla Bartók (1906), and Percy Grainger (1908), for example, used it for various purposes, Kodály and Bartók to demonstrate that the ethnic basis of Hungarian peasant song owed nothing to Gypsy music, and Grainger to reveal the artistry of the English country singer. Grainger’s strikingly original transcriptions in the *Journal of the Folk-Song Society* (Grainger 1908) influenced Bartók’s own detailed transcriptions of Hungarian, Slovak, Romanian, Serbo-Croatian, Arabic, and Turkish music. These scholars were also composers who saw possibilities for the renewal of Western art music in drawing on folk-music idioms.

Eastern European collectors were among the most assiduous of those making field expeditions after 1900. In Moscow, a Musical-Ethnographic Commission was founded in 1901 and sponsored field expeditions for recording purposes in parts of the Russian Empire, including the Ukraine and Georgia as well as among Mongol and Yakut peoples. Linyova's graphic notation of Russian folk polyphony that she had recorded was a notable attempt to grasp its structural principles. After the Russian Revolution, the study of "folk" or "ethnic" music received strong support from the state, and several notable Soviet scholars emerged: K.Kvitka (1880–1953), for instance, born in the Ukraine, founded and led the Folk Music Bureau at the Moscow Conservatory in 1933 and published important essays on, for instance, calendar songs and folk musicians (cf. Kvitka 1972–1973). One of his students was Moshe Beregovski, who made detailed studies of traditional Jewish music in the Ukraine (Beregovski [1934] 1982). In Hungary and Poland, the important archival centers at Budapest, Warsaw, and Poznan were irreparably damaged in World War II, but postwar field collecting managed to restore knowledge of traditional genres and styles, including several described or recorded earlier by such collectors as Oskar Kolberg in Poland and Bartók and Kodály in Hungary.

In America anthropologists had devoted effort to studying Indian musics: the recordings of Franz Boas (Kwakiutl, 1895), Livingstone Farrand (Quileute, Quinault, 1898), Frank Speck (Creek, Yuchi, 1905), and Joseph K.Dixon (Crow, 1908–1909) were housed at the American Museum of Natural History in New York. These, along with the recordings of Fewkes, who later became director of the Bureau of American Ethnology in Washington, DC, and others made by the Field Museum in Chicago, the Peabody Museum of Harvard University, the Pennsylvania Museum in Philadelphia, and the University of California at Berkeley, served as the basis for important work in ethnomusicology. The influence of Boas at Columbia University and Edward Sapir at Yale University led to work on Eskimo and Native American musics by Frances Densmore, Helen H.Roberts, and George Herzog. Marius Barbeau studied both French Canadian and Canadian Indian musical idioms, and the Museum of Man in Ottawa has continued to sponsor investigation of musical traditions in Canada.

The availability of sound recordings posed the need for archives and laboratories. The Vienna Phonogramm-Archiv was founded in 1899, the Musée Phonographique in Paris in 1900, and the Phonogramm-Archiv of Berlin, active from 1905, had its beginnings with Stumpf's collecting in 1900. The Berlin archive became the most significant of these for the future of ethnomusicology because it was systematically linked to research into the world's music under the tutelage of Erich M.von Hornbostel, who served as director from 1905 to 1933. A circle of workers at the Berlin archive included some who would later emigrate with the coming of Nazism: George Herzog, Mieczyslaw Kolinski, and Klaus Wachsmann. Also associated with the archive were Marius Schneider and Walter Wiora, who continued the "comparative" basis of the archive's work in contrasting ways: Schneider on musical prehistory (1946) and the distribution of polyphony (1934), Wiora on the comparative study of European folk music (1953). Another colleague of Hornbostel was Curt Sachs, who, although he had training in musicology and taught at the University of Berlin, was an ambitious historian of art. Sachs collaborated with Hornbostel on a major project dealing with musical instruments, the "Systematik der Musikinstrumente" (Hornbostel and Sachs 1914, Eng. trans. 1961). Later, after

immigrating to the United States, he compiled learned works on dance, music, and instruments that enshrined the concepts of comparative musicology.

After World War II, however, the premises of comparative musicology fell into disrepute. The Berlin School's work had an undeniable bias of cultural evolutionism built into it, and even Sachs came to question notions of "progress" in music in his book *The Wellsprings of Music* (1962), which was prepared for posthumous publication by his younger colleague, Jaap Kunst. By this time, functionalist anthropology, itself a reaction against post-Darwinian ideas, had begun to influence the discipline, and the study of single music cultures displaced comparative endeavors. Kunst, a notable specialist in Indonesian music who had also studied his own Dutch folk music, succeeded Sachs as honorary president of the Society for Ethnomusicology and Vaughan Williams as president of the International Folk Music Council. Kunst was also the teacher of Mantle Hood, who later became a leading figure in the development of ethnomusicology after 1960. Hood was to introduce a generation of students to the discipline through an Institute for Ethnomusicology at the University of California, Los Angeles. Hood's concept of "bi-musicality," in which performance was taught by native instructors, was central to his notion of how his students could arrive at a meaningful knowledge of "non-Western" musical idioms (Hood 1960). At UCLA, Hood enlisted the services of Charles Seeger, whose philosophical bent as a musicologist offered a foil to his experimental work with the Melograph Model C, a device for portraying a melodic line more precisely as well as its tone-color. Like other scholars, Seeger thought that Western notation was inadequate to describe the complex fluctuations of music from oral tradition. Following Seeger's lead, melographic studies of vocal and instrumental music emerged, although his claim that the Melograph could somehow portray "musical events" was called into question.

Charles Seeger was also motivated by ideological concerns: to promote egalitarianism and to educate young Americans musically along a broad front of acquaintance with diverse idioms. His writings reflect these concerns (cf. Seeger 1977). Some of his goals have been brought nearer fruition in and through the performance careers of his famous children, Pete and Peggy, and by the Lomax family. In particular, Alan Lomax, son of the folklorist John Lomax who recorded cowboy songs, has produced several works of importance, especially the collaborative *Folk Song Style and Culture* (1968), which set forth the idea of cantometrics, a cultural and musical scale for constructing profiles of song style around the world. A later version was geared to music education through the use of cassette tapes (Lomax 1976), and Lomax also made a film on the cross-cultural analysis of dance (1975). With the classification of melody types and tonal structures put forward by Kolinski (1961), Lomax's attempt represents one of the few to evolve a cross-cultural methodology in ethnomusicology after 1960. It has not escaped criticism, in particular for ethnocentrism and inadequate data bases.

A parallel development reflecting the dominance of anthropological thought in North American ethnomusicology, and particularly its paradigms of cultural relativism and functionalism, is found in the work of Willard Rhodes (Peyote music), Richard Waterman (African influence on Black music), and David McAllester. Studies of Navaho music by McAllester typically stress the cultural values that are expressed therein (cf. McAllester 1954). The figure who was to emerge with the greatest status from this orientation, however, was Alan Merriam, whose *The Anthropology of Music* (1964) set

the standard in American work for several decades. Merriam was less concerned with the technical analysis of music than with probing the cultural values that scholars could discern in field studies of musical life. Merriam proposed a feedback model for music (concepts, sound, behavior) that was new and dynamic. Merriam's musical analysis, however, did not match his brilliance as a theorist. He delineated his own fieldwork with the Flathead Indians of Montana in a later, less successful book that relied on such conservative techniques as intervallic description and statistical analysis of the music (Merriam 1967). Most recently, Merriam's model has been modified to include elements of theory and method drawn from the interpretive anthropologist Clifford Geertz.

One other influential anthropologist of music, the English scholar John Blacking, began his career with field studies of the Venda people of the Transvaal. Coming into conflict with the South African authorities, Blacking left to take up a chair of anthropology at Belfast in Northern Ireland. Where Merriam's work tends to mask ideological issues, Blacking's writing carries a strong ideological flavor, and his book *How Musical Is Man?* (1973) set the tone for a new exploration of ethical questions in ethnomusicology. By the mid-1970s, the conventional methods of the discipline (objectivist field collecting, transcription, classification) had suffered under concerted intellectual attacks from anthropology. Methods of transcription and classification such as those developed by Bartók (Bartók and Lord 1951) receded in importance, and major compilations of traditional tunes, such as those by B.H. Bronson (1959–1972) and T.Knudsen, S.Nielsen, and N. Schiørring (1976), marked, with the work of W.Danckert (1970) and Wiora in Germany, a diminution of interest in comparative scholarship. In contrast, Blacking brought an array of concerns to the field: the description of music, the ethnography of musical performance, the anthropology of the body, meaning and value in music, and ethics. His teaching at Belfast attracted students from Third World countries because of his insistence on the scrupulous regard of the scholar for coworkers, and it inculcated a strong sense of the reflexivity that was permeating anthropology during the 1970s and 1980s.

By the mid-1970s, ethnomusicologists had begun to question their methods with some prompting from the intellectual Left. The expropriation of musical traditions by Western collectors and scholars, through recordings and expository texts, emerged as a thorny issue in the 1970s and 1980s. Research in Africa, the Americas, Australia, and the Pacific raised ethical dilemmas in studying the music of indigenous peoples given the brutal colonialist politics that had dispossessed or displaced them. Critics questioned the role of the ethnomusicologist in evaluating music cultures through the "objectivity" prized by an older generation of fieldworkers such as Constantin Brailoiu (1981) or George List (1974).

At the same time, the influence of Marxists such as the Italian social philosopher Antonio Gramsci found its way into studies of popular music in Western society. As a result, ethnomusicologists, with folklorists and cultural historians, were drawn to scrutinize the politics of culture, a dynamic that often takes the form of tension between socialist and nationalist ideologies. One semiotically based study of propagandistic song by Vladimir Karbusicky (1972) demonstrates how the proponents (Nazis, Communists) often use similar musical and textual means.

Some of this had been prefigured in the work of the sociological Frankfurt School (Adorno, Horkheimer, Marcuse), which dealt with the place of music in an industrial

society. Sociologists of “popular music” have examined the role of media and mass-produced musical culture, continuing thereby the tradition stemming from the Frankfurt School. This perspective has tended to rely, however, on the semiotic analysis of music and society rather than the reflexive study of individuals. The romantic pastoralism of the folk-music revival in Europe, moreover, was dismissed by these scholars for the reason that “folk music” was a regressive kind of musical idiom. The flowering of the folk revival in the 1950s and 1960s, first in Britain and Ireland, then in Italy, Germany, and Scandinavia, was a development that had serious political consequences. Stimulated by Alan Lomax’s brand of populism, the revival initially encouraged resistance to the commercialization of popular music but later gave way to issues of regionalism, political empowerment, and gender. Symposiums on ideology and tourism, as influences on traditional music, posed these as two pressing issues in the 1980s. The twin themes of ideology and cultural policy, often as reactions to tourism or the need for an imagined past, have generated studies of musical applications—for example, on Ireland by E.O. Henry (1989), on Sweden by O.Ronström (1989), and on Switzerland by S.Bolle-Zemp (1990). Another study by J.K. Cowan (1990) has analyzed the ideological intertwining of music, dance, and politics in Greece.

The anthropological legacy of Merriam and Blacking found its way into several studies of small-scale societies: S. Feld’s work on the Kaluli people of Papua, New Guinea (1982, 2d ed. 1990), R.Stone’s on the Kpelle of Liberia (1982), and A.Seeger’s on the Suyá of Brazil (1987). This research, based on intensive fieldwork, exemplifies the close attention to musical concepts and behavior by an ethnomusicology that is cogently influenced by theory and method in anthropology. Because of that influence, its practitioners often appear to prefer the terms “musical anthropology” or “anthropology of music” to “ethnomusicology.” The value of these works lies in their detailed exposition of music and musical concepts as symbolic of social formations, though they do tend to portray the societies as somewhat homogeneous. The “restudies” that occurred in anthropology have begun to filter into ethnomusicology, such as Nazir Jairazbhoy’s recent restudy of the fieldwork in India of his teacher, the Dutch scholar Arnold Bake, in the 1930s (Jairazbhoy 1991). Ascruity of the discipline’s history, indeed, seen as a split between “anthropology of music” and “comparative musicology,” was at the heart of a recent conference.

Perhaps the most surprising development in recent times has been the exploration of western art music by ethnomusicologists who, in the past, had shunned this as part of a European cultural dominance they regarded with suspicion. The German scholar Walter Wiora initiated the study of European folk music as a source for art-music composition (Wiora 1957). But the historical division between “folk-music study” and “ethnomusicology” began to break down in the 1970s, mainly under pressure from key figures such as Charles Seeger, Frank Harrison, and Gilbert Chase. The conceptual divorce of “European music” from “non-Western music,” part of ethnomusicology’s debt to anthropology, has gradually begun to move toward resolution in a few publications. Scholars began to realize that if ethnomusicology is the study of “world music” rather than of “non-Western music,” then they must include Western art music in such a scheme. Further, John Blacking had emphasized the biology of music making in his later work, a topic that involves the nature of musical intelligence cross-culturally (Blacking 1992). This area of investigation overlaps to some degree with the traditional concerns of

“systematic” musicology: perception and cognition, the computer analysis of time series, and tone measurement. This more “musicological” move within ethnomusicology has come partly from Europe, where traditions of ethnographic research have not always been as strong as they were in North America.

Organology has been a major part of ethnomusicology ever since Hornbostel and Sachs set forth their program for the systematic comparison of musical instruments. Various alternative schemes of classification have been set forth since, for example by Hood (1971) and Kartomi (1990). Tonometric analysis using Ellis’ system of cents is still used, though with modification. African and Indonesian music has often been the focus of such research because of its scale formations. The Study Group on Folk Musical Instruments of the IFMC (ICTM) has produced numerous volumes of conference proceedings, mainly on European folk cultures. These studies have explored instruments from other perspectives, such as use, manufacture, or musical concepts. The new subfield of musical archaeology, significant for the relationship between historical, systematic, and ethnomusicology, has relied mainly on the analysis of musical instruments to suggest the use of music in pre- and early history. Similarly, the ICTM study groups on analysis and systematization, dance choreology, and so on have tended to show the interdisciplinarity of a great deal of work in ethnomusicology. And the institutionalization of the field has lately come under scrutiny from a number of viewpoints.

A significant venture in this regard was the founding, by John Blacking, of the European Seminar in Ethnomusicology (ESEM) in 1981. The seminar, which came into existence for reasons of financial support for scholars unable to travel to meetings in North America, has met regularly and published its conference proceedings. An allied development has been the emergence of European journals for the study of traditional music, such as *Culturi musicale* (1985–), *Cahiers de musiques traditionnelles* (1988–), and the *British Journal of Ethnomusicology* (1992–). Recent issues have included work by scholars from the former Soviet Union as well as studies of Central Asian music by East Europeans. While the dream of a Europe united politically has faded in the agony of Bosnia, the breakup of the Soviet Union has opened up possibilities for cooperative research. The question raised by some Europeans, of whether there is a “European” or an “American” mode of ethnomusicology, draws boundaries that are largely nonexistent. The discipline has always benefited from the scholarly exchange of views. The Society for Ethnomusicology, the International Council for Traditional Music, and the ESEM include members from many countries, and the council has met in locations that are worldwide. In Africa, the Americas, Asia, and Europe, researchers have continually sought international contact in the study of musical cultures, including their own. Symposiums on orality and literacy in music, for example, or tourism and music have taken place in Japan and Jamaica, respectively. Indeed, the question of whether there is an “inside” view of a particular music (as opposed to an “outside” one) is moot, since scholars now tend to believe that every view of the music has some value, whatever the angle of perception. The subjectivity of individual musical experience, in other words, has begun to influence the evaluation of all kinds of music in terms of its production and consumption.

In the late 1970s, ethnomusicologists felt the need to move beyond a “hard-core” musical ethnography that had emerged earlier in the decade. This was largely the result of

a growing dissatisfaction with cultural relativism and with describing single cultures in depth as if they had no relation to the outside world. The dissatisfaction also arose, in part, from the information explosion and increasing cultural contact among the world's peoples through radio, television, and cassette recordings. It was less a premature return to the vexed question of musical "universals," which had been a recurring if unresolved theme during the 1970s (see *Ethnomusicology*, Vol. 15, 1971). At the same time, the influence of European literary and philosophical movements began to find its way into ethnomusicology, principally that of phenomenology, hermeneutics, and Marxist social anthropology. The work of Pierre Bourdieu, Paul Ricoeur, and others resonates sympathetically with the influence of Geertz and other anthropologists who emphasize the need for a greater self-consciousness on the part of the social researcher. Semiotics, on the other hand, has been less influential in ethnomusicology, largely because of the abstractedness of its musical analysis. As a corrective, Blacking called for exploring a range of "ethnic perceptions" in the semiotics of music (Blacking 1981). Some attention, however, has been paid to the iconic properties of music. Folkloristics, in contrast, which had pioneered the study of individual tradition bearers in the 19th century and had foregrounded the analysis of context, events, and artistic performance in the 1970s, continues to have an effect on ethnomusicological thinking. The influence of sociolinguistics, palpable in folklore studies, has found its way into ethnomusicology—for example, in P.Hopkins' analysis of the musical and symbolic codes that permeate playing of the Hardanger fiddle in Nonway (Hopkins 1986).

Since the mid-1980s, some scholars have directed their attention toward synthesis in ethnomusicological theory and method. An account of the discipline's recent history by R.M.E.Joseph (1988) drew attention to four "converging models" in ethnomusicology, derived from (1) semiotics, (2) folkloristics, and (3) sociolinguistics (performance and context studies), and (4) cognitive semantic anthropology. J.H.K. Nketia had already advocated integrating objectivity and experience in ethnomusicological studies in order to avoid the conceptual dichotomies set up by divorcing music sound from music behavior, or the social from the musical (Nketia 1985). Like Nketia, Blacking has called for a "reintegration of musicology" that relies to some extent on cognitive processes in fashioning a "human science of the tonal art." Dropping the indefensible "ethno-ö prefix, this integrated musicology will forge its own theory and methods by explaining the facts of music making in all known societies. The task is "to discover in each case what is irreducibly musical and to what extent musical factors are paramount." Following the phenomenologist Alfred Schutz (1951), Blacking believes that individuals have the capacity for "making musical sense of the world" and can transform abstract structures of cognition and affect into social and cultural forms. How this musical "tuning-in" becomes conceptualized and can be reproduced in other contexts, with other meanings, is a major problem for the human sciences that Blacking (1991) believes is not peculiar to music. Similar, if more abstract statements, have come from East European ethnomusicologists who take a broadly anthropological, comparative, and synthesizing stance in the study of "man, culture, cosmos" (Karbusicky 1990) or "culture, text, man" (Zemtsovsky 1993). While ethnomusicology still acknowledges its debt to anthropology, a paradigm based on musical performance as a potent symbol of human intentionality seems to be at the forefront of the discipline. An ethnomusicology that aims at synthesis

through a comparative study of performance is, therefore, the central concern of the 1990s.

Etymology, Folk (Popular)

A process by which people either (1) mispronounce or change the pronunciations of foreign or strange-sounding words to make them more similar to, or compatible phonologically with, other words in their lexicons, or (2) explain from hearsay evidence how particular words originated.

“Woodchuck” is a transformation by folk etymology from the Ojibwa or Cree word for that animal (*otchig* and *otcheck*, respectively) and has nothing to do with wood or chuck(ing). The Spanish *cucaracha* (wood louse) evolved by folk etymology into “cockroach,” an insect that has no relationship to either a rooster (cock) or a freshwater fish (an early, and still alternate, meaning of roach). Because of folk etymology, “sparrow grass” once (mid-17th through the mid-19th century) competed with “asparagus” as the name of a common vegetable, and “chaise lounge” now vies with the original French *chaise longue* as the designator for a long reclining chair.

Folk etymology is also used to identify hypothetical explanations—usually presented in story form—for word derivations. After the spelling of *surloin* (a cut of meat from an animal’s hindquarter) was changed to “sirloin,” someone created, and others perpetuated, the tale that an enthusiastic English king once knighted a loin of beef, his country’s national dish, dubbing it “*Sir Loin*.” Another story illustrating folk etymology attributes the origin of *gringo* to a misperception that occurred in 1846–1848 when Mexicans, hearing American soldiers repeatedly singing the Robert Burns song “Green Grow the Rashes, O,” heard the first two words as one and subsequently identified Americans as *gringos*.

Fable

An animal tale with a moral, according to folklorists. Ben Edwin Perry, the authority on Aesopic tradition, preferred an ancient Greek definition that captures the fable's essentially rhetorical genius: "a fictitious story picturing a truth." According to Perry, the fable is an artistic form that can include stories from any of several genres, with human, animal, or inanimate objects as their characters. Its defining quality is its use of narrative metaphor to make a point. Most fables teach worldly wisdom and shrewdness, not moral values or good conduct (cf. Perry 1965).

Fables have a long history, both oral and literary. Aesop, a Thracian slave (later a freedman) who lived on the island of Samos in the sixth century B.C., told his stories, which have Semitic antecedents, orally. Beginning in the fourth century B.C., collections of prose fables attributed to Aesop were used by rhetoricians. In the Middle Ages, Greek, Latin, Indian, and other fables circulated in collections called beast epics, with Renard the Fox and similar characters. European (and thus Euro-American) fable tradition comes, therefore, from many different cultures.

Fables with sound moral lessons have long been considered suitable reading material for children. Most fables, however, are satiric rather than preceptive. These include La Fontaine's *Fables* (1668 Eng. trans. 1954) and James Thurber's *Fables for Our Time* (1940) and *Further Fables for Our Time* (1956). Some of Thurber's fables are modern inventions, while others are variants of Aesopic tales; many include proverbs as their morals. For example, one about journalists in a rush to publish is called "The Sheep in Wolf's Clothing;" in another, "The Tortoise and the Hare," the hare wins the race, and the moral is: "A new broom may sweep clean, but never trust an old saw."

American oral tradition transmits fables as proverbs (sour grapes, the lion's share, don't count your chickens before they're hatched). In addition, satiric animal fables are recounted orally, especially in African American tradition. In one, a fox trapped the deer who had been raiding his garden. The deer sang beautifully, and tricked the fox, who wanted to hear better, into letting him escape. According to the narrator, "There's people just like that, these confidence men.... There's a lesson in all these stories" (Dorson 1967:96-97).

Fairies

The supernaturally powered “little people” of European folklore. Apart from the generically distinct, ubiquitous Tooth Fairy, described by one scholar of the subject as “America’s only [indigenous] fairy,” beliefs and customs concerning fairies from European tradition appear sparse in most parts of North America. A wealth of documentation from Atlantic Canada, however, in the form of informational testimonies, place names, personal-experience narratives and local legends, has revealed a vital, living heritage of transplanted and adapted Irish, Scottish, English, and French (*lutin*) fairylore in that region.

The variety of fairy behaviors depicted in such accounts render any single definition of “fairy” lacking. In part, this diversity of meanings reflects the complex etymological development of the Modern English term “fairy” from conceptually related terms in Latin (*fatua, fatum*), Old French (*fee*), Old English (*fagan, faege*), and Middle English (*fay, fairye*). As it has developed in Britain and continues to evolve in the English-speaking world, “fairy” is a generic term that has incorporated the meanings of many regional supernatural rivals such as “boghost,” “phooka,” “boobagger,” “bugalug,” “thurse,” “shuck,” “Sidhe,” and “Tylwyth Teg.” Today this associative, subsuming process goes on, with creatures such as elves, pixies, goblins, and *lutin* often being thought of as “kinds” of fairies. Interestingly, many informants who participate in living fairy traditions refuse to use the term. Because of a traditional taboo against saying “fairy” aloud, fairies on both sides of the Atlantic are often referred to with a variety of euphemisms, including the “good people,” “those people,” and simply “them.”

It has been argued that the 20th-century meaning of “fairy” as a male homosexual developed in the United States in the late 19th century, but at least one student has contended that such usage occurred in Britain as early as the 16th century with the advent of the small, delicate, effeminate fairy of literary tradition.

Contemporary students of fairylore in Atlantic Canada have interpreted fairies as representing challenging, “significant other” societies of liminal personae possessing supernatural powers that can be used for evil or good. Fairies have been described as being between heaven and hell (fallen angels), between the dead and the living (restless dead), or spatially dwelling between purity (a mortal’s home or home community) and danger (deep woods, barrens, bogs, cliffs) in areas such as barns, gardens, and berry grounds. Thus, fairy liminality has demanded that mortals be cautious, observe taboos, and practice defensive and remedial magic.

Sometimes portrayed in oral tradition as a diminutive race living in groups or in solitude, but rarely in pairs, fairies dress in all manner of garb (red suits, flowing gowns) and engage in both festive (dancing, playing musical instruments, feasting, ridinghorses [*lutin*]) and solemn (funerals) activities. Verbal depictions of fairies in Atlantic Canada have been influenced by mass culture, but they usually have not included the diaphanous-winged, dainty fairy images of literature and popular culture.

The presence of fairies has often involved extraordinary natural circumstance (such as “fairy winds”) or psychological influence more than actual visible, physical interaction. In Newfoundland, for instance, to be “in the fairies,” “fairy-led,” “led astray,” or “taken astray” refers to a form of disorientation sometimes resulting in getting lost in dangerous areas, frequently while berry picking or cutting wood in a forest. While in this mental state, an individual may experience being in one place and then in another without temporal or spatial transition. One of the most popular counteractant magical practices in such circumstances has been to reverse one’s fate by turning articles of clothing (cap, shirt, or coat) inside out.

In other circumstances, physical disorders have been attributed to fairies, again often without actual human-fairy encounters. The fairy “blast” in Newfoundland, parallel to the European “elf shot,” is a wound that commonly becomes tumorous. It is inflicted by angry fairies in contexts in which individuals intrude on fairy territory or cross fairy paths. Narrators maintain that when medical doctors have lanced such tumors they have found objects such as feathers, pins, straw, hair, and teeth. Similarly, changeling accounts cite the presence of an abnormal, often old, fairy “child”; yet, as a rule, the “normal” fairy abductors of the human child are not caught in the act. It is relevant in this regard that recent interpretations of European changeling traditions stress the parental importance of such beliefs in assigning moral responsibility for the advent of disabled infants to fairy activities rather than to personal deficiencies.

While all of these fairylore phenomena have clear European antecedents, perhaps the greatest distinction between Old and New World fairylore is the spatial emphasis of the latter, a characteristic that has expressed the need of dealing with potential tragedies of getting lost or encountering mortal dangers in vast wilderness areas through magico-religious means. Orally circulated accounts concerning dangerous zones, and the tragic encounters of specific individuals with fairies in such places that have resulted in permanent physical stigma (awkward demeanor, disfigurement, premature aging, lameness, speech impairment) or psychological disability (“strange” behavior, retardation, “sinful” tendencies, insanity) have served as geographical warnings on the cognitive maps of community residents. In addition, they have left moral imprints as cautionary tales and served as agents of social control. As such, fairylore has maintained traditional values by stressing the importance of subordinating individual desires to collective needs (obedience to community norms) and the necessity of yielding to the wisdom of generational pressures (the admonitions of one’s elders concerning fairies as threatening figures). Strong community beliefs in fairies have also provided opportunities for some individuals, as in the case of changeling “parents,” to coalesce with fairies by using fairy explanations in order to avoid the sanctions, embarrassment, and shame of other, more condemning traditional interpretations (such as the “cursed child”—a child cursed by the sins of its parent[s]). Relatedly, oral accounts reveal the possibility that fairy explanations have been used as alibis to mask a variety of deviant behaviors such as extreme tardiness, premarital sexual relations, infidelity, incest, child molestation, wife battering, and sexual assault.

In Atlantic Canada in the late 20th century, fairy beliefs are often relegated to the recent past or thought of as moribund. Informants cite a variety of causes for the demise of fairy traditions, including the advent of roads, cars, electric light, television, and other contemporary electronic media. Some students of fairylore maintain, however, that fairies

have not disappeared; they have simply transformed into the growing numbers of “little green” inhabitants of unidentified flying objects (UFOs) who continue their traditional practice of abducting humans with impunity. Others observe that for centuries there have been reports of fading fairy traditions and that the idea of the fairies’ disappearance itself is part of the fairylore belief complex.

Fairs

Exhibitions, held on an annual basis, usually lasting up to a week, featuring livestock, agricultural, and domestic products along with commercial displays, midways, and entertainment. Modern fairs have their roots in the European trade fairs and markets of the Middle Ages in which farmers and merchants offered their wares for sale. In the United States, Elkanah Watson is generally credited with initiating agricultural fairs and promoting agricultural societies in 18th-century New England for the purpose of disseminating information to farmers and improving agricultural practices. In the 19th century, state departments of agriculture began to provide funds in support of prizes or premiums to be given to exhibitors for the best produce, crops, and animals shown at county fairs. Agricultural exhibitions and livestock shows continue as major aspects of fair activities in the late 20th century. Run by volunteer boards of directors elected by stockholders or shareholders, fairs are organized into various departments headed by superintendents.

Fairs in the United States may be described as local festivals, which have predictable schedules and are marked by expressive public forms such as parades, rituals, and competitions that serve educational, social, economic, and symbolic functions. Typical fair events include tractor pulls, harness racing, dairy and beef cattle shows, shows of other livestock (swine, sheep, poultry, goats), demonstrations of sheep shearing, carding, and spinning, fire department and farm equipment parades, beauty contests, demolition derbies, and auto thrill shows.

Fairs foster a sense of place and regional identity and encourage a feeling of pride in the occupational skills associated with agriculture and farm work. Adults enter open-class competitions at county fairs, while young people involved in the Future Farmers of America, Junior Grange, and 4-H Clubs participate in various restricted classes, where they receive recognition for their achievements and learn both formally and informally from adults and peers what is expected of them

in this setting. The judging process promotes set standards, such as uniformity, neatness, style, and appearance, by which animals, crops, canned and baked goods, and needlework are measured. Judges examine exhibits, provide comments to exhibitors, and reinforce the shared values that define blue-ribbon winners, who then are eligible for competition at the state-fair level.

The agricultural components of county fairs are paralleled by commercial displays featuring local businesses, such as banks, feed stores, and car dealers; civic and charitable organizations ranging from Rotary and Kiwanis Clubs to the American Heart Association and the Red Cross; county, state, and federal government agencies having to do with agriculture, land use and management, rural life, health and social services; and political parties and their candidates, especially in election years.

These community-based sections of county fairs contrast with the entertainment provided by the carnival midway, which consists of rides, sideshows, and games of skill and chance—attractions and amusements from outside the local area. The sociability that characterizes the agricultural and commercial departments is replaced by a less familiar, more surrealistic atmosphere on the midway, which depicts the transient and the ephemeral against the agricultural interests that are distinctly rooted to the land.

Agricultural fairs have always combined a dual nature with a multiplicity of voices and symbols emphasizing progress and technology while at the same time presenting a nostalgic view of a romanticized rural past. The tensions and contradictions between an impulse for change versus a need for stability, between emerging and ongoing traditions, between various participants and fair audiences, and the relationships of animal and

human, of human and machine, of rural and urban—all find expression against the backdrop of the fair.

Fakelore

“The presentation of spurious and synthetic writings under the claim that they are genuine folklore” (Dorson 1971:9). As the study of folklore struggled to define itself and its field of interest, the term “fakelore” was coined and defined as above by Richard M. Dorson in 1950. Fakelore is the product of writers, not the product of the folk and folklore process. What triggered Dorson’s campaign was the appearance of Benjamin A. Botkin’s anthology *A Treasury of American Folklore* in 1994, which received critical acclaim in the popular press and in folklore circles.

Dorson coined the term to show his outrage. He was concerned that publications such as the *Treasury* present themselves as compendiums of true folklore when, from Dorson’s perspective, they were at their best superficial and at their worst “uncritical encomiums” that catered to the marketplace and not to a true presentation of what folklore is. Dorson sought to undermine the respectability of what he perceived as the vulgarization of the study of folklore and of folklore material itself. Publications that pretended to be folklore and lacked verification of their authenticity or any scholarly apparatus that might be used to shore up their claims to authenticity needed to be denounced. He intended the term “fakelore” to “become a rallying cry against the distortion of a serious subject” (Dorson 1950). The critical need was to educate the public about the true nature of folklore and to shore up the scholarly integrity of fledgling folklore-studies programs that were at the time beginning to appear on American university campuses.

Now that the study of folklore is firmly established in academia, folklorists are looking again at the material once labeled “fakelore” with a different purpose. Terms such as “folklore” and “folklorismus” seek to legitimize scholarly interest in the commercialization of folklore for mass-marketing and tourism purposes. Links between popular culture and folklore can be explored once the actual province of each had been understood within the discipline of folklore.

Family Folklore

Traditional behavior learned through oral transmission and/ or customary example and shared among family members who may or may not consciously regard it as important or distinctive to their family life. A diverse range of genres constitutes family folklore, including family stories, proverbial expressions, songs, nicknames, customs, rituals, foodways, and folk arts and crafts. Some of these traditions may have been observed by past generations, while others are created and enacted in the course of but one generation. Important factors that affect family folk tradition include ethnicity, regional culture, religion, socioeconomic class, and family size and structure. For example, the number of family members affects the number of times families celebrate family members' birthdays each year, which could influence the nature of the birth-

day celebration tradition; religious beliefs shape the nature of a family's Passover or Easter observance; and ethnicity and ethnic identity may affect what a family eats and drinks in everyday life and on festive occasions.

Folklore studies of family culture in the past have usually concentrated either on the study of a noteworthy folk tradition practiced within a particular family (for instance, folk

pottery or folksong), or on traditional narrative shared among family members, often across generations, about the family past. In the former, folklorists have focused on a specific folkart tradition performed by the family for the community; in the latter, on personal-experience stories or legends shared within the family unit and dealing with family life and history.

Mody C. Boatright's essay "The Family Saga as a Form of Folklore" (1958) was one of the first American folklore studies to concentrate on family legends based on traditional motifs. Later studies of family folk narrative tend to deal with historical personal-experience stories and their transformation into third-person legendary narrative as one generation passes them on to the next. Past family-folklore studies have also treated family foodways and religious traditions; however, few American folklorists have described and analyzed secular custom and ritual in lengthy, detailed ethnographies. Theodore C. Humphreys' essay "A Family Celebrates a Birthday: Of Life and Cakes" (1991) is one of the few discussions of the birthday celebration in American family life, certainly a widespread tradition with many variations. American sociologists, however, have examined family custom and ritual since mid-century, when the James H. S. Bossard and Eleanor S. Boll study of family ritual appeared (1949).

The mass media, new technologies, and commercial merchandising increasingly affect family folklore, but in no way do they discourage it. In fact, sometimes they facilitate the maintenance of traditions or the creation of new ones. For example, an artificial Christmas tree is not a folk artifact in and of itself, but how the tree is decorated (even with commercial ornaments), where it is placed, and the customary music, foods, and behavior associated with its decoration—all make up a holiday folk tradition that is important in many American families. Annual television specials during the Christmas season are by no means "folk theater," but as a family views a particular holiday special year after year, the event becomes a ritualized holiday observance for its members. Changes in camera and video technology affect family photography and the conventional "family photograph album" and "home movie." However, traditional content, themes, and visual images continue to appear in family videos viewed on the television screen and computerized programs of family photographs.

Family members may take for granted many kinds of behavior within the family as "the way we do it," and may not conceptualize the behavior as family folklore because it is so familiar to them. Everyday traditions in family life are as important as the festive traditions that first come to mind. Just as significant as holiday rituals, family reunions, and religious rites of passage in family life are weekday foodways, mealtime prayers, gardening, housekeeping duties and responsibilities, the uses of individual and collective space in the home, and vacation travel customs—all are family traditions that deserve the folklorist's scrutiny.

As social historians and sociologists have revised their conceptualization of the American family in recent years, so have folklorists expanded and reconsidered their conceptualization of family folk tradition. The nuclear-family model—father as breadwinner, mother as homemaker, children nourished by generational continuity—no longer represents the reality of contemporary family life. In fact, most social historians of the American family question whether it was ever as vigorously and positively maintained as commonly believed. The distinction between the "horizontal" family (viewed at any given moment in time) and the "vertical" family (viewed over time across

generations) is helpful in clarifying the definition of family, as is the distinction between “family” and “household” (Roush 1994:62, 65–66).

Family counselors, social-work agencies, and the media have increasingly addressed issues of dysfunction, abuse, and emotional trauma within American families, both reflecting and stimulating public discussions of American family life and the politics of family-related legislation. As a consequence, folklorists have initiated studies that range beyond the positivist functionalism of past family-folklore studies, which emphasized the celebratory and focused almost exclusively on issues of positive family identity. In the last decade of the 20th century, they are expanding their definitions of family and the kinds of behavior to be studied as family folk tradition. In addition to the more conventional family-folklore subject matter like family narrative and foodways, new research interests include folk tradition in gay and lesbian families, customary housekeeping and gender roles, disciplinary traditions in the family and their relation to family values, dyadic tradition shared by childless couples, rituals of separation and exclusion, strategies of celebration innovated to meet the constraints of time and energy, the hybridization of customs in blended families, and the divorce story as a family-narrative genre. Such family folklore studies reflect concerns at large in American society about variations in family life.

Farmers

People engaged in the growing of crops on farms in whose cultural life the traditions surrounding this engagement play a significant role. The farm is both an economic and a social unit, worked by members of a single family. The traditions of these rural agricultural groups vary depending on geographic region, available resources, and ethnic and religious traditions. The resulting cultural life is a mix of elements both agricultural and nonagricultural, traditional and assimilated.

Farmers have been the object of folklore studies since the beginnings of the discipline, when European scholars described rural folk cultures as unchanging and folklore as “survivals” from earlier cultural stages, “in our time but not of it.” For folklorists in North America, the French Canadian *habitants* and the Pennsylvania Dutch were the archetypes of the traditional farmers, members of an industrious culture with customs of European origin. This approach, evolutionist in theory and archaeological in method, emphasized the collection and preservation of farmers’ oral literature, customs, and folk music. While it included elements of folklife, it generally neglected material culture. An excellent encapsulation of the aims of the scholarship of the time appears in a report on a farmers’ proverb, “Your tongue is hung on a swivel and is loose at both ends” (Smith 1948). Its subject is a member of the family (the wife of the folklorist’s own grandfather). Its logic is based on familiarity with the swivel and other farm implements of the day. The “author,” who comes from a cultural region where the “habitual use of proverbs” survives, himself has a “gift for language.” In one story from New Hampshire, a clergyman congratulates a farmer on his success with a rocky plot of land, saying, “‘You and God certainly have done a nice piece of work here.’ ‘Yeah,’ the man answered, ‘you ought to have seen it when God had it all alone’” (Botkin 1947:172). Under government sponsorship during the 1930s and 1940s, this and other farmers’ stories were collected in the field or from older written sources and published in many larger collections of regional folklore.

From the second half of the 20th century, folklore scholars began to move beyond the mere placing of farmers’ lore in a historic and geographic context. Spurred by the decline of rural farming communities, and in keeping with the reorientation of their discipline from product to producer, folklorists shifted their focus from the study of traditional farms per se

to the study of local, regional, or ethnically distinct communities of farmers. They forged links with the many academic disciplines whose paths met at the study of farmers' traditional life. They began to deal with the diverse picture of rural traditions in the United States and Canada, the result of many different traditions laid one over the other as immigrant groups arrived to farm the land. Yet, for the most part, folklorists have chosen to focus tightly on a region or a rural craftsperson, leaving larger issues (such as women as farmers) to historians or sociologists. Four areas of study have been perhaps the most productive to folklorists: material culture studies, cultural geography, history (especially oral history), and folklife study. In addition to expanding our picture of rural agricultural traditions, the bridges built between these areas and folklore have meant that the term "farmers" can now include many who formerly were not considered farmers *per se*, such as women, African Americans, and Native Americans.

Material-culture studies generally have been concerned with the history of a particular craft, or have focused on the craftsperson and his or her tradition. Thus, we can read of rural potters or quilters (or pots or quilts), and only indirectly of the craftsperson as farmer. Yet, material-culture scholars have contributed to our understanding of different farming traditions through study of the physical and cultural characteristics of farm types. The types of farm that became dominant in the United States and Canada carried on the traditions of northwest European colonists. They were conceived of as self-sufficient family units, yet tied to the community through shared religious beliefs and market economy. The chief variants of this type developed along cultural lines. The *habitant's* farms of Quebec stretched along the rivers like towns along roads, forming part of an extended community that included those engaged in river traffic. Among the English and

SwissGerman religious groups of Pennsylvania, the farm was conceived as more independent, indeed as the image of an orderly and enduring religious community. Farms were occupied by one family over several generations. Their choice of land, their building style, and the planned diversity of their crops and livestock reflect the desire of these farmers for permanence. The agricultural traditions of the Scotch-Irish conceived of the raising of crops as a part-time occupation, augmented by cottage industry. These farmers chose poorer, cheaper land, often on the hills rather than in the valleys. They were also less inclined to settle permanently.

While the northwest European model was carried westward by settlers of the pioneer period to become predominant in the North American Midwest, the Scotch-Irish tradition prevailed in Appalachia and in the Southern Uplands. Cultural geographical studies have helped trace the migration patterns of these settlers by tracing the spread of variant building traditions, such as those for barns, fences, and farmhouses, or for farm layout and village planning. Some folklorists, using linguistic models, have made detailed examinations of the “grammar” of the aesthetic behind such building traditions to understand the psychology of rural agricultural communities (Glassie 1975).

The diaries of settlers on the frontier and the accounts of those days by their children or grandchildren are mines of information about regional and rural history as well as traditional practices. The process of clearing new land was directed toward establishing the farm and involved the same techniques as farming, such as choice and management of draft animals. Yet, farmers seem to have recognized by 1870 that the farming life their fathers had come to regard as unchanging was, in fact, facing great change (Van Wagenen 1953). Developments such as rail transportation and mechanized farming in the form of harvesters, balers, and especially tractors put pressure on farmers to put aside traditional practice, practical experience, even government incentives and switch to raising a single cash crop. Amish farmers continue to follow a daily and a seasonal cycle of traditional work—feeding livestock, hauling manure, and repairing harnesses and equipment in the winter, and plowing, seeding, and harvesting in the summer—yet the inroads made by mechanization have not left these religious communities untouched (Hostetler 1963).

Scholars of rural agriculture have faced the passing of traditional farming and the decline in the number of farmers by studying the accompanying economic and social changes. Among the methods developed for this was the use of personal interviews to construct an oral history of events. This method has been used to reconstruct and understand life as lived by members of farming communities in Appalachia (Montell 1983) and elsewhere. While some oral-history projects have resulted in scholarly treatments of a community's history, others, such as the *Foxfire* books, have been successful grass-roots efforts to record traditional folkways (Wigginton 1972 and later). In particular, folklife studies and oral histories have enlarged our understanding of the ways in which women contributed as members of farming communities.

Folklorists have broadened their view of farmers by joining farming communities to record the experience of farmers from inside (Welsch 1990). Enough of these books have appeared that they have become a genre, with a necessary focus on region. Working in the public sector, folklorists have also made farmers' lives accessible and more comprehensible to the public. The 1991 Festival of American Folklife in Washington, DC made farm life a major focus. Museums such as the Farmers' Museum at Coperstown,

New York, serve as reconstructed communities for public education and as research facilities, and are geared toward the presentation and understanding of rural folklife and the everyday processes of farm life. At Plimoth Plantation in Massachusetts, archaeological evidence was used to study the material culture and illuminate the folklife of the English Pilgrims. In addition, evidence of unusual diet and house construction not matching the English traditions revealed the presence of Black farmers in Plymouth after the Revolution.

Two trends still hinder the researcher of the traditions of farmers. First, agricultural traditions that coexisted with the dominant farm type are seldom studied beyond the local level, in articles in journals of regional folklore. Few comprehensive studies by folklorists exist that encompass these traditions and their impact (for one such study, see Stilgoe 1991). Second, the majority of studies of rural agricultural people or communities continue to assume the farm and focus on the craft or craftsman, the storyteller or the storytelling. Folklore about farming itself seems to fly past in snippets in the midst of the study of the community or its products.

Feminist Approaches to Folklore

Decentering of male-centered (androcentric) cultural paradigms in order to make room for female voices and rhetorics. In America the first wave of feminism culminated in 1920 with the passage of the nineteenth Amendment to the Constitution, granting women the right to vote. The second wave began for many women when they read Betty Friedan's *The Feminine Mystique* (1963), Simone de Beauvoir's *The Second Sex* ([1949] 1970), Kate Millett's *Sexual Politics* (1970), or Shulamith Firestone's *The Dialectic of Sex* (1972). Arguing that much of Western civilization is patriarchal (not only male-centered, but also organized and controlled so that women are subordinated to men), these works initiated the process of teaching women to resist the ways in which women are conditioned to participate in their own objectification by, and subordination to, the various relations of power in society.

Feminism happened when women realized that the "personal" was "political," when, as is now frequently noted, "women learned to say 'I.'" By the 1980s, feminism had also learned just how political that "I" could be when poor and working-class women, women of different racial and ethnic identities, and women who were bisexual and lesbian accused the women's movement of the 1960s and 1970s (which had frequently represented women's lives through a use of the communal "we" as if all were Anglo, middle class, and heterosexual) of being essentialistic and appropriative. These voices and the variety of discursive practices variously adapted by feminism (from psychoanalytic, Marxist, poststructuralist, and postmodernist theories) have made feminism of the 1990s a multivocal project.

Although feminism of the 1990s has no single theory or practice, there are points of affinity among feminists. Gender (the traits, whether biologically inherited or culturally constructed, that constitute what is masculine and what is feminine) is understood as being fundamental to lived experience, while the multivocality of that experience (the differences among women according to race, class, age, occupation, religion, sexuality, and the like) is also acknowledged. Sexual inequality is asserted to be a cultural construct. Thus feminism generally seeks (1) through "feminist critique" to disclose the ways in which culture and the rhetorics through which culture is constructed have been shaped and dominated by male perspectives, (2) through ethnographic fieldwork, oral-history projects, and literary history to record present and retrieve past female lives, and (3) through what is termed "gynocriticism" to uncover, discover, and/or develop a female-centered language and theory of aesthetics. From inception, the feminist project has called for both intellectual and political participation. In other words, it has endeavored not only to document and interpret culture, but to transform and create culture as well.

Feminism reached the discipline of folklore in the 1970s. The first issue of *Folklore Women's [Feminist] Communication* was published in the fall of 1973, and two collections of essays focusing on women's experiences followed: *Women and Folklore* (1975), edited by Clair R. Farrer, and an issue of *Frontiers: A Journal of Women Studies*

that published a special cluster of essays on the topic "Women as Verbal Artists" (1978). The inscription of women's lives, points of view, and heretofore marginalized genres was to continue throughout the 1980s and into the 1990s. Rosan A. Jordan and Susan J. Kalcik edited and published *Women's Folklore, Women's Culture* (1985), a collection of essays theoretically indebted to Mchelle Zimbalist Rosaldo's (and the other contributors to *Woman, Culture, and Society* [1974]) interest in the separation between domestic or private (female) and public (male) spheres in cultural production. The *Journal of American Folklore* followed with a special issue in 1987 on "Folklore and Feminism," ed. by Bruce Jackson, and the *Journal of Folklore Research* published a special issue in 1988 on "Feminist Revisions in Folklore Studies," edited by Beverly J. Stoeltje, both of which began to more fully theorize women's lives in respect to extant power relations. In 1990 Camilla A. Collins edited a special issue of *Southern Folklore*, "Folklore Fieldwork: Sex, Sexuality, and Gender," which inscribed the transformative effects of feminist discourses on fieldwork relationships, methodologies, and interpretive strategies, thus mapping the extent to which American folkloristics had become a feminized discipline.

While the disclosing of androcentric claims to universality as gendered discourse was to open spaces for female voices, the retrieval and foregrounding of these voices was the central feature of early feminist applications in folklore studies. Until the 1970s, the majority of published fieldwork had been collected by male researchers from male informants and had focused on canonical genres (such as folktale and legend, folksong and ballad), relegating such genres as gossip, anecdote, and personal narrative, frequently associated with women's performances, to marginal status. As Farrer noted in her Introduction to *Women and Folklore*, "the general trend throughout the history of the *Journal* [of American Folklore] has been to rely on data from women for information about health, charms, some games, and various beliefs and customs but in other areas to use women as informants only when men informants were unavailable" (Farrer 1975). To this Marta Weigle added the further observation that not only were important genres overlooked, but such practices "fail to record versions they feel to be 'inferior,' and misconstrue the native system of artistic genres and critical evaluation" (Weigle 1978). Weigle was to go on to foreground the genre of women's gossip-anecdote in relation to folk belief, in particular its ability to engender cosmic order(s), establishing a new paradigm, "gossip as myth," and thereby critiquing hegemonic dichotomies between "the mundane and the theoretical," between "data and theory" (*Spiders and Spinners* [1982] and *Creation and Procreation* [1988]). In doing so, Weigle began to map the possibilities of what Margaret Mills has more recently referred to as "low theory" in her argument for folklorists "to see how 'experience near' (from our subject's point of view) our theoretical constructions can be" (Mills 1993).

Susan J. Kalcik, working with the structure and aesthetics of women's personal narratives, identified what she called the "kernel story," a story that emerges from the conversational context, the point of which may shift to meet the needs of the conversational group. For example, one woman's brief anecdote about a female student who consciously tried to get lower grades than her boyfriend because he "had threatened to take back his fraternity pin if she continued to get a higher grade point average than he did" might be expanded upon later by the original narrator or by other women in the group such that it becomes a commentary on either "how men do not like women to display their intelligence" or how "women are stupid to deny their abilities." Eventually,

as a traditional piece of the group's repertoire, such kernel stories might be alluded to, "Right, like X's student," in order to support another story. Such storytelling appears to be collaborative in nature, a process of women narrating together, and thus problematizes the disciplinary dominance of monovocal, authoritative modes of storytelling (Farrer 1975).

Analogously, Elaine J. Lawless—working with the life stories of female ministers (*Handmaidens of the Lord* [1988] and *Holy Women, Wholly Women: Sharing Ministries through Life Stories and Reciprocal Ethnography* [1993])—has suggested that women construct their life stories as "deeply-explored blocks of experience" that give to their narratives a "many-layered, multi-textured structure" that is different from the "lin ear, objective, goal-oriented" stories told by men (Lawless 1991). Furthermore, while documenting how female ministers claim discursive space for themselves in relation to a traditionally male sphere of cultural production by invoking metaphors of nurturing and motherhood, Lawless also began to explore a "reciprocal ethnography" that intensifies the collaborative nature of a subject-subject relationship between ethnographers and the people with whom they work.

The necessity for women to negotiate carefully their discursive spaces as well as the various ways in which this is done has been further explored by Joan N. Radner and colleagues (*Feminist Messages: Coding in Women's Folk Culture* [1993]), who have documented strategic coding practices women use as a means of expressing covert ideas that the dominant culture and, in some cases, they themselves would be adverse to. For example, as Susan S. Lanser has argued, a woman's claim or performance of domestic incompetence (an inability "to cook, bake, knit, sew, or keep a clean house") may function as a coded rejection "not only of the task in question but also of a culturally constructed female role." The woman claims "I can't" when she means but cannot say "I won't" (in Radner 1993).

Moving female experience from the margins to the center of cultural production has meant, on the one hand, describing the function of telephone gossip among two elderly immigrant Hungarian American women as they negotiated performance space and, on the other hand, describing aesthetic differences in performances between female and male family members. It has meant collecting legends and memories from among Mexican American women that disclose the physical and emotional vulnerability of their lives while documenting the possibility that motifs found in both female and male narratives can mean different things depending on the performer's gender. It has meant exploring female verbal aggression and female erotica, an Anglo woman's making of teddy bears, African American women's "rap," Kodiak midwifery, Mormon women's visionary narratives, and a Sicilian American woman's "giving an altar" during a St. Joseph's Day feast. And it has meant listening closely while women perform and/or explain the significance of quilting and rug making or describe the uses and meanings of the interior spaces of the dwellings in which they live and work.

But while documenting women's lives and communicative forms has been a primary focus in feminist applications to folklore, without early and continuing feminist critique the invisible gaps in academic discourse would not have been made visible and thereby open to female voicings of female experiences. Early forms of feminist critique (frequently referred to as the "images of women approach") focused attention on representations of women in androcentric speech and literature (oral and written). In

folklore studies, Kay Stone, for example, added her voice to what was to become an onslaught of revisionary treatises on fairy tales, particularly those canonized within American popular culture that represented women as either passive and good or active and evil. More recently, Maria Herrera-Sobek has examined the stereotypical image of Mexicanas and Chicanas in Mexican balladry (*The Mexican Corrido, A Feminist Analysis* [1990]).

By the 1980s, the “culture as text” metaphor, developed in the discourses of cultural studies and symbolic anthropology, made the broad rubric of culture accessible to methods of critique initially developed in literary studies, and textual-critical activities were applied to culture in general. In folklore studies, feminist cultural critique is exemplified by Barbara A. Babcock’s analysis of process-commodity relations in respect to the lives of three women (Helen Cordero, a Cochiti potter and inventor of the storyteller doll; Elsie Clews Parsons, a folklorist and feminist of the early 1900s; and the Statue of Liberty). In the essay, Babcock discusses the effects of commodity fetishism on folk artists and material-cultural studies, the invisibility of female academics and their work, and male appropriation of the female body for use as a semiotic object (Jackson 1987). Analogously, Robbie E. Davis-Floyd disclosed the medical establishment’s rituals for enculturating women into a “technological model of reality” by means of a paradigm that represents the female body as a defective machine and technology as necessary for successful reproduction (Jackson 1987). M. Jane Young analyzed the actual and symbolic processes of women’s reproductive power in Western Puebloan identity (Jackson 1987). And Beverly J. Stoeltje examined the construction and negotiation of female gender in rodeo festivals (1988), while Dianne Dugaw historicized negotiated constructions of gender and sexuality in respect to British and American balladry (*Warrior Women and Popular Balladry, 1650–1850* [1989]).

Whether working from an essentialist, biologist definition of gender, from a constructionist definition of gender, or from a more mediated position; whether exploring the separation between domestic (female) and public (male) spheres of cultural production or the significance of “mothering” and an ensuing “ideology of reproduction”; or whether emphasizing oppression or repression, raising consciousness or exploring the unconscious, disclosing power relations or exploring pleasure—American feminist applications to folklore have had a salient affect on the discipline. This has been felt most strongly in discussions of fieldwork.

Where older models of ethnography were governed by the essentializing discourse of scientific objectivism and an implicit empiricism that constructs the scientist as subject and that which is studied as object, contemporary feminist (female and male) fieldworkers discuss subject-subject relations that emphasize contiguity and reciprocity, acknowledge the ethnographer’s subjectivity and the ethnographic subject’s agency, accept the decentering effects of multivocality, and court a dialogic discourse. Where older models of ethnography were governed, as Debora Kordish has disclosed (Jackson 1987), by themes of colonialist conquest and penetration or, as Miriam Camitta has suggested, by a male model invoking a “sharp delineation of the self from the other” defined by “separation and autonomy” (Collins 1990), contemporary ethnography has begun to explore themes of surrender and of affiliation and connectedness. Because representational practices construct and thereby create culture, researchers in a feminized folkloristics now must ask, along with Gayatri Chakravorty Spivak, “not merely who am

I? but who is the other woman [man]? How am I naming her [him]? How does she [he] name me?" (*In Other Worlds: Essays in Cultural Politics* [1988]). To this Margaret Mills has cogently added that we must also "ask for *whom* we are translating [disclosing meaning] and to what end?" (Collins 1990).

Festival

A time set aside for celebration. The American festival of the late 20th century can be traced to earlier religious revival meetings, political gatherings, and Saturday night dances. Annually there are more than 3,000 festivals held in the United States, so the student of festivals is confronted with a bewildering variety of events. At the most basic level, there are homegrown, grass-roots festivals organized by and for a particular community.

Since even grass-roots festivals involve considerable planning to bring together people and resources, they must be calendared events. Many of them come from the older agricultural year and are structured around a particular crop such as the watermelon, peanut, or eggplant—whatever is of economic and symbolic importance to the particular community. Such planned-for events contrast with the everyday, notably the workaday, world. Ceremonial events underscore the special, nostalgic, traditional nature of the festival. Festivities suggest evoking the spirit of fun, of entertainment, play, and games.

Sometimes these basic homegrown festivals evolve in order to make the event understandable and appealing to outsiders. Then, as organizers discover that they can attract wider audiences and greater profits, they typically work actively to attract tourists and consumers. The resulting event may still have folk roots, but it tends to move in the direction of mass popular culture.

The oldest grass-roots festival in the United States is the Fiesta de Santa Fe, which seems to have started in 1715. The term “folk festival” came into use much later; one of the first uses was in 1892 to describe performances of traveling musicians in Virginia. By the early 1900s, “folk festival” had been used in other areas of the country to describe the performances of immigrants. Large-scale folk festivals are a 20th-century development. In 1927 Bascom Lamar Lunsford (1882–1973), a small-town lawyer interested in the old-time music in his area, began the Mountain Dance and Folk Festival in Asheville, North Carolina, to celebrate southern Appalachian music and dance. His festival differed little from other fiddle contests that began during the same decade, but his title showed that this event was, in part, aimed at tourists. Yet, much of the original audience for the festival was composed of people who knew the performers because they were friends and neighbors.

Later, the brilliant and eccentric Sarah Gertrude Knott (1895–1984), a woman of considerable energy and vision, chartered the National Folk Festival in St. Louis, Missouri. Along with her business manager, Major M.J. Pickering (1883–1957), she held the first National Folk Festival there in 1934. This festival differed significantly from the festival originated by Lunsford. For one thing, it was multicultural, rather than monocultural. Among the performers at Knott’s festival were American Indians, French singers, cowboy singers, Mexican American musicians, sacred-harp singers, singers of sea chanteys, lumberjacks, costumed dancers of different ethnic origins, and an Afro-American choir. Knott included both “survival” performers (those whose performances represented an unbroken chain of tradition from their own family and community) and

“revival” performers (those who learned performance skills from a culture other than their own). The term “revival” persists, but few “revival” performers are reviving anything from their own culture, and there is little evidence that the “revived” art continues in its new family.

The National Folk Festival, founded in 1934, is the oldest consecutive folk festival in the United States. It is produced by the National Council for the Traditional Arts, a private, nonprofit corporation. In the early years, the festival moved from city to city, depending on the vicissitudes of financing. Sponsoring cities included New York, Philadelphia, Chattanooga, Chicago, Cleveland, and Washington, DC. For a time in the 1970s and early 1980s, the festival seemed to have found a permanent home at Wolf Trap Farm Park in Vienna, Virginia. However, it has once again moved from place to place. The decision to move about this time was made not so much for financial reasons as ideological ones. Organizers reasoned that once communities hosted the National Folk Festival, they would be in a good position to start up their own local celebrations. Recent locations under this plan have included the Akron-Cleveland area of Ohio; Lowell, Massachusetts; Johnstown, Pennsylvania; and Chattanooga, Tennessee.

Because folk festivals require dedication, time, and energy, as well as money, few have had the staying power of the National Folk Festival. For example, the Pennsylvania Folk Festival was launched with good intentions and high hopes in the 1930s. George Korson (1899–1967), a journalist and collector of folklore in Allentown, Pennsylvania, put on a small festival featuring anthracite-coal miners in 1932. This success

ful festival came to the attention of the president of Bucknell University, who invited Korson to come to Lewisburg as director of the newly created Pennsylvania Folk Festival. Like the National Folk Festival, Korson's festival performers included ethnic dancers, occupational groups, and American Indians. Although Korson held festivals at Bucknell in 1936 and 1937, the Pennsylvania Folk Festival could not overcome the combined effects of the Depression and World War II gas rationing.

Once the war was over, there was increased leisure and tourism, spurred in part by plentiful gasoline that cost only 15 cents a gallon. One of the striking developments of the postwar period was the monocultural festival, celebrating a single minority culture in a particular region. For example, in 1950 a group of professors from Franklin and Marshall College started the Kutztown Folk Festival in Pennsylvania, celebrating the folk culture of the Pennsylvania "Dutch" (Germans). Although the more secular Pennsylvania Germans support the festival both as participants and as visitors, the Amish and the Mennonites, who are depicted, do not. The festival is particularly strong in crafts such as bread baking, chair caning, and blacksmithing. It also includes dramatic creations that purport to show the religious strife that led to immigration, and dramatic skits featuring mock trials, hangings, and weddings. These costumed skits are, however, highly romantic in concept. Other monocultural festivals include the Cajun Festival at Abbeville, Louisiana, and the annual Crow Fair at Crow Agency, Montana.

A postwar festival with national scope was the Newport Folk Festival in Rhode Island, created after the popular group the Kingston Trio drew large crowds at the 1958 Newport Jazz Festival. In the late 1950s and early 1960s, the Newport Folk Festival featured popular folk celebrities along with traditional performers. The stars helped attract large audiences. However, many who attended had no interest in tradition and came only to hear the stars.

The Festival of American Folklife has loomed over all other festivals since its inception in 1967. Run by the Smithsonian Institution, it is presented on the National Mall in Washington, DC. Originally planned for a week in early October, the festival is now scheduled to coincide with the Fourth of July holiday every year. In the 1970s, fieldworkers for the festival traveled far and wide to identify participants. Some original fieldwork continues and helps ensure the high quality and authenticity of the exhibits and performances. Innovative techniques for presenting traditional folk performers have been developed. Although a few urban folksong revivalists are presented, the emphasis is on traditional folk performers, not only in music, but also in the areas of occupational skills, foodways, crafts, and narratives.

Over the years, the Smithsonian staff has come up with a number of fresh categories for presenting folk culture. One such innovation was the "featured state" program, which started in 1968 with Texas. This device is primarily a way to obtain funding through state legislatures, but it also stimulates fieldwork and challenges folklorists to find new ways to present their findings. For example, in 1982 when Oklahoma was the featured state, a racetrack was set up on the Mall to showcase the excitement of quarter-horse racing. In 1983 when New Jersey was the featured state, a replica of the Atlantic City boardwalk was erected. Similarly, in 1992 when New Mexico was featured, a full-scale adobe house

was built. These largescale structures are created in an attempt to suggest context and to show work skills.

There are numerous folk experiences at the job site, whether blue-collar or white-collar, and these have been grist for folklorists since the 1930s. The Third National Folk Festival, held in Dallas in 1936 as part of the Texas Centennial, offered demonstrations in various work skills. These were expanded in a series the Smithsonian launched in 1971 with a program featuring the folklife of construction workers. Since then, they have presented the folklife of meat cutters, bakers, garment workers, carpenters, cowboys, farmers, stone masons, sheet-metal workers, seafarers, taxi drivers, firefighters, and others. Some of these programs have resulted in publications and documentary films.

In part spurred by the post-1965 increase in federal and state funding for cultural programs and in part encouraged by the example of the Festival of American Folklife, more American colleges and universities began sponsoring folklife festivals in the early 1970s. Some festivals, like the New Jersey Folk Festival at Rutgers University founded in 1975, have evolved from the presentation of hobby crafters and revival performers toward featuring more traditional and ethnic artists. Others, like the Blue Ridge Folklife Festival at Ferrum College in Virginia, emphasized precommercial musical idioms and rich craft traditions from their very beginnings.

Part of what is new is the widespread acceptance of the term “folklife,” which was rejected by some early festival organizers such as Sarah Gertrude Knott, who considered it condescending and manipulative. Those who like the term believe it allows them to show facets of culture other than music and dance.

Whatever the origins of these festivals may be, folklorists are increasingly attending them, planning them, and studying them. Yet, the scholarly literature on folk festivals is surprisingly sparse. What little study has been done tends to have been done by folklorists who themselves have had some festival management experience. Understandably, these studies have been addressed to other folklorists who share concerns about such issues as authenticity and the politics of culture. The primary concern of the professional folklorist has been to find and to showcase authentically traditional participants.

For the festival director, the festival is a statement of taste and a managerial challenge. For the staff, a festival represents hard work, a chance to meet old friends, and an opportunity to have intimate backstage access to traditional artists. At its best, the festival is to tradition bearers, both musicians and craftspeople, a validation and affirmation of their art and of their culture. It is somewhat harder to say just what the festival means to its audience. It is clear that entire cities can be drawn into folk celebrations. In 1992 the city of Lowell, Massachusetts, had as many as 186,000 people at its weekend Lowell Folk Festival (a continuation of the National Folk Festival’s 1987–1989 stay in that city). That festival, located in the middle of an industrial downtown, enjoyed support from nearly every segment of the population.

Some critics of folk festivals have suggested that most festival goers are not really attentive or knowledgeable about what they are seeing and hearing. Indeed, folklorist Charles Camp has argued that a tourist audience can be counted on to respond positively to *any* exhibit or performance, including a “dead monkey.” What Camp was suggesting was that public taste could be excited by anything out of the ordinary and that crowd

psychology can be counted on to lure more and more people regardless of the actual merits of the attraction.

If festival audiences will be entertained by anything, what do festivals accomplish that is different from other entertainment? The key here, most folklorists say, is that audience attention is not a relevant index for the festival's success, value, and justification. The important thing to focus on is the festival's impact on the artists. What do folk artists derive from festival participation? It is something much more important than money—a sense of pride and a validation of their art and their culture. Exit interviews with both musicians and craftspeople, with few exceptions, typically confirm that their festival experience gives them renewed confidence, enthusiasm, and pride, which they take back to their home communities.

Fans of folk festivals note that they are expected to meet higher criteria than any other public-performance event. No one expects a symphonic performance to improve the lifestyle and community values the performing artists, but folklorists constantly look for such positive benefits for folk communities at folk events. This seems as much a misunderstanding of performance as it is an affirmation of the positive values of folk performance.

Festival of American Folklife

A living exhibition of folklife traditions produced every summer for about two weeks around the Fourth of July by the Smithsonian Institution, outdoors on the National Mall in Washington, DC. The festival is organized by the Smithsonian Institution's Center for Folklife Programs and Cultural Studies as part of its mission to research, present, and conserve the skills, knowledge, aesthetics, and wisdom of grass-roots cultures.

Since its inception in 1967, the festival has featured more than 16,000 musicians, artists, performers, craftspeople, workers, cooks, storytellers, ritual specialists, practitioners of folk medicine, and other exemplars from numerous ethnic, tribal, regional, and occupational cultures. It typically includes daily and evening programs of music, song, dance, celebratory performance, crafts demonstrations, cooking demonstrations, storytelling, illustrations of workers' culture, and narrative sessions for discussing cultural issues. The festival is free to the public and annually attracts up to 1.5 million visitors. As the largest annual cultural event in the U.S. capital, it receives considerable media attention. It has often energized efforts of featured tradition bearers and organizations to continue their own research, education, cultural conservation, and advocacy work. The festival is documented and has stimulated the production of other publications and educational products.

The festival was founded by Ralph Rinzler in 1967 under Smithsonian Secretary S. Dillon Ripley and Division of Performing Arts Director James Morris. It was part of a larger effort by Ripley to make the National Mall more accessible to the American public and to make the Smithsonian's programs more exciting and engaging. Rinzler developed the model of a research-based festival from his work at the Newport Folk Festival in Rhode Island and the ideas of Alan Lomax, Charles Seeger, Don Yoder, and others. It was an instant hit in its first year, drawing approximately 400 visitors and the praise of the Washington press. Congressional support followed, as the festival, drawing inspiration from the civil rights movement, represented many people and communities not usually given national attention. Its popularity encouraged the development of the folk-arts program at the National Endowment of the Arts, the American Folklife Center at the Library of Congress, and several state programs. The festival was a centerpiece of the U.S. Bicentennial in 1976, lasting for three months and involving thousands of participants.

The festival developed ways to present cultural traditions, including the concept of researched and curated programs organized around such ideas as the African Diaspora, Old Ways in the New World, occupational cultures, featured states, countries and regions, and various themes, such as cultural conservation. To date (1995), the festival has featured exemplary tradition bearers from 53 nations, every region of the United States, scores of ethnic groups, more than 100 American Indian groups, and some 60 occupational groups. The annual event typically includes several distinct international, regional-state, occupational, and thematic programs. The strongest feature of the festival is its attempt to foreground the voices of tradition bearers as they demonstrate, discuss,

and present their cultures. At the festival, tradition bearers, local scholars, and Smithsonian curators speak for themselves, with each other, and to the public. The festival encourages visitors to participate—to learn to sing, dance, eat the foods, and converse with people represented in the program. Like other Smithsonian exhibits, the festival includes museum-quality signs, photo-text panels, a published program book and catalog, learning centers, museum shops, and food concessions. It also attempts to create a physical context for the traditions represented. The event has included, among other things, a horse racecourse (from the Washington Monument to the U.S. Capitol Building), an Indian village with 40-foot-high bamboo and paper statues, a Japanese rice paddy, and a New Mexican adobe plaza.

The festival annually costs about \$2 million to produce and is supported by a combination of federal appropriations, state and foreign-country contracts, foundation grants, corporate and in-kind gifts, and concessions income. Diana Parker, who succeeded Rinzler as festival director in 1982, supervises a staff of about 80 and about 100 volunteers a day who work on the festival.

The festival is a research-based production, over the years drawing on the efforts of more than 700 folklorists, cultural anthropologists, ethnomusicologists, and numerous other academic and lay scholars. Research for the event and documentation of it have resulted in complex community-level collaborations, training, and a documentary archival collection held at the Smithsonian and disbursed back to various local institutions. These resources have been used for various publications by fellows, visiting scholars, and the Smithsonian's own folklife-studies series; for Smithsonian Folkways recordings; and for various other educational products.

The festival has had strong impacts on policies, scholarship, and on folks "back home." Many U.S. states and several nations have remounted festival programs and used them to generate laws, institutions, educational programs, documentary films, recordings, museum and traveling exhibits, monographs, and other cultural activities. In many documented cases, the festival has energized local and regional tradition bearers and their communities, and thus helped conserve and create cultural resources. It has provided models for the Black Family Reunion, the Los Angeles Festival, and other major civic cultural presentations, including America's Reunion on the Mall for the Clinton Inaugural.

The festival generates a great deal of publicity and has positively affected cultural tourism in many places. In 1994 it was named the "Top Event in the U.S." by the American Bus Association as a result of a survey of regional tourist bureaus—thus joining previous winners that include the Olympics and the World Expo. The festival has also been the subject of numerous books, documentary films, and scholarly articles.

Fiddle Music

Traditional music played on a bowed stringed instrument. The fiddle has been in America since European settlement, and its cultural significance is magnified by its prominence in so many different regional and ethnic styles throughout the continent. Fiddle tunes are the backbone of the dance repertoire in many American traditions, and the fiddle has been pressed into other uses as well. Though fiddle music ebbed in favor during the mid-20th century, by the later part of the century the instrument enjoyed a resurgence. The American traditions within which the fiddle is central are variegated, yet not so different as to preclude a remarkable cross-cultural sharing in which the fiddle is instrumental.

The word “fiddle” has long and deep English roots; indeed, the word is cognate with “violin,” since the Italian *violino* is, in effect, “little *viol*,” and “*viol*” is simply “fiddle” in Romance guise. To musicians in North America, “fiddle” and “violin” are essentially synonymous terms, though the former is apt to be informal and the latter formal. Yet, people persist in inquiring whether the two terms signify different instruments, or at least different musical styles. The sense that the words signify something different reveals a sort of cultural clutter that a little history may illuminate.

Fiddle-like instruments have existed in Europe, Asia, and Africa for millenia. Central Asia, the original domain for the cultivation of the horse, may also be the original domain for the fiddle with its horsehair bow. The modern violin originated in the 16th and 17th centuries in northern Italy, where a cluster of famed instrument makers settled upon a design for the violin that proved vastly popular. The Italian violin spread northward through Europe, displacing other varieties of fiddles as it took hold. By the early 18th century it had established itself as a court instrument in Great Britain, and by the late 18th century the success of a number of violin manufactories, which produced the new violins in quantity, made the instrument accessible to ordinary people. It thus emerged as the central instrument in a revolution in instrumental music and popular dance that swept the British Isles in the later 18th century. That cultural revolution parallels rather neatly the larger social and political revolutions that transformed the English-speaking world in the later 18th century.

Americans often think of American fiddle music as simply continuing and elaborating on the British styles and repertoire. To an extent this is true, but the reality is more complex. The modern repertoires and styles of fiddling in the English-speaking world, and indeed in much of northern and central Europe, took shape in the late 18th and early 19th centuries. During this period, every region participated in the revolution in instrumental music and dance, yet each region developed a particular style and repertoire influenced by its own cultural norms and values. Thus, the modern styles of Scotland, Ireland, England, Quebec, and Maritime Canada, New England/New York/Pennsylvania, and the Piedmont/ Appalachian region of the Upper South arose in the same general era. Though the flow of culture was largely from the British Isles to America, these regional styles can best be described, not in terms of ancestry and descent, but as cultural cousins.

There is a classic form to instrumental tunes (and for the most part this means fiddle tunes) in the cultural style that has predominated since the 18th century. A typical tune has two sections (or “strains”), each having a duration of eight or sixteen beats (or “steps,” in terms of dance). The strains are subdivided into shorter melodic sections

("phrases"), which may correspond to phrasing in the dance steps. In theory, all of the phrases could be made up of musically distinct material (*abcd*), but in practice the weaving of similar melodic material into different phrases (similar to rhyme and assonance in verbal art) is aesthetically attractive and aids the memory as well (such as, *abac*). The first strain is played, then repeated; next, the second strain is played, then repeated; then the entire tune is repeated. The same tune may be repeated in this way until the dance is over, or the music may move from one tune to another in medley fashion.

The relationship of instrumental music to dance is profound. The origin and history of virtually all of the many genres of American fiddle tunes are bound up in dance forms that arose in the later 18th or early 19th century in the British Isles or continental Europe and spread rapidly to the Americas. The *reel*, a quick-paced instrumental tune in 2/4 or 4/4 originally associated with group dancing in lines (longways), dates from before the late 18th century but became the dominant genre in the new repertory. The *jig*, which also predates the Revolution but developed a large and complex repertoire soon after, has a structure and rhythm similar to the reel but uses 6/8 meter. The *slip jig*, popular in Irish music but less common in other regions, uses 9/8 meter. The *hornpipe*—not the earlier hornpipe genre but a bold new form of the late 18th century—is usually in 4/4 but at a slower pace than the reel; it marks the advent of the modern solo fancy dance, and its phrases or strains characteristically close with three crisp eighth notes, echoing the steps of the dancer.

The beginning of the 19th century brought couple dancing and an array of associated genres to the Americas. First was the 3/4-time *waltz*, which arrived from Europe via England as the century began. The 1840s brought two new dances of central European provenance, the *schottische* (a German dance inspired by the European Romantic rage for things Scottish) and the *polka*. Both were fashionable ballroom dances, yet their enduring popularity in America (especially in the North and Midwest) was buttressed by the simultaneous immigration of German and other ethnic populations from central Europe.

By the mid-19th century, new dances emerged together with clusters of new instrumental repertoire. The *clog* was the first of a parade of new solo fancy dances leading ultimately to tap dancing in the 20th century. The *Negro jig* and other adaptations owing to the popular influence of the minstrel stage revealed a more homegrown American trend in dance and instrumental music. By the end of the century, ragtime augured a 20th century of successive dance styles, with a debt to both African American traditions and popular culture, which radiated through and left an imprint on American fiddling.

Though fiddling and dancing seem inextricably intertwined, traditional fiddling has made use of other musical genres in America. The *march* is a well-known item in many fiddlers' repertoires. Marching is a form of dancing, but the relationship to fiddling goes deeper: Throughout the 19th century, many fiddlers in the United States were also fifers in local fife-and-drum corps, and there was thus a great degree of crossover between fiddling and fifing repertoires. The fiddle also came to be closely associated (especially in the American South) with a class of lyric folksongs that are spritely, playful, allusive, and occasionally obscene. Verses from these songs are often performed by solo fiddlers or ensembles along with the instrumental tune.

Such “instrumental songs”—that is, songs associated with instrumental music, as opposed to the older solo lyric song tradition—may be an element in what might be termed the gradual emancipation of fiddling from dance. So was the use of fiddles to mimic the human voice in slow airs, hymns, and other songs. But for whatever reason, the fiddle, while never losing its connections to dancing, prompted the evolution of a repertoire of tunes that are maintained and performed solely to be listened to. Whether on a back porch, in a saloon, or on a stage, the fiddle became a concert instrument in folk tradition just as it did in popular and elite music.

Several regional styles of fiddling emerged in America, and their broad outline has persisted despite the cultural flux and interchange of the 20th century. The performance style on the fiddle varies most in bowing patterns. Bowing, as fiddlers attest, is the essence of fiddling, and the way one handles the bow defines one’s style. In particular, whether one plays each note with a separate bow stroke or joins together more than one note in the same bow stroke (“slur”), and what pattern of slurs and separate strokes are used, creates the musical texture that, in regular recurrence, is called style.

In any region there is a wide variety of bowing styles—fiddling provides room at the local level for stylistic variety, and most localities boast fiddlers who perform at various levels of technical proficiency and stylistic elaboration. But there are larger patterns of stylistic consistency that define regional and subregional styles. In Canada and the Northern United States, the bowing styles reflect a preference for separate bow strokes, and slurs tend to group the notes into twos or fours. In the Southern United States, particularly in the Upper South, there is a preference for bowing patterns that syncopate the musical texture—groupings of notes in a complex fabric of threes and twos, stylized anticipations of the beat, and other devices closely resembling the syncopations characteristic of 20th-century American popular music. The resemblance is not fortuitous, for evidence suggests that these patterns of syncopation first emerged in Southern fiddling, then spread into other zones of folk and popular music.

In the 19th century, both Whites and Blacks participated in Southern fiddling, shaping together the emergent regional style. The syncopated patterns are an African American contribution to folk fiddling—and ultimately, through fiddling, to the popular musical idiom of the civilization at large. This is only the most dramatic example of an ethnic contribution to American fiddling. The early regional styles were all syntheses of an ethnically heterogeneous population assembled from various parts of the British Isles, northern Europe, Africa, the Caribbean, and perhaps even American Indian cultures. The cultural syntheses in fiddling can be said to represent an infusion of ethnic elements into the new regional cultures of America.

Later immigrants also left their mark in fiddling. The Irish immigrants after 1850, populating both urban areas and rural regions, brought the new Irish style with them and influenced both style and repertoire, especially in Canada and in urban areas of the Northern United States. The German immigration similarly had an impact on Midwestern fiddling, and German and Jewish musicians contributed to traditional fiddling styles in another way through their major influence upon American popular and “classical” music, which in turn had an impact on rural folk styles. By the 20th century, immigration had less influence on rural areas and the regional styles rooted there, but urban neighborhoods continued to sustain a wide variety of ethnic musics depending on the fiddle. Since the diffusion of the Italian violin was not limited to Europe and the Americas, but included

North Africa, the Middle East, and Asia as well, contemporary immigrants from those parts of the world have brought with them not only a host of fiddling traditions but several that already utilized the modern violin.

The repertoire of American folk fiddling is vast and varied. Tunes are not simply musical fodder, to be shaped and reshaped as fancy directs. Rather, they are treated like precious artifacts, to be acquired, preserved, and rendered faithfully. Most fiddlers do not compose tunes, but some do, both by conscious composition and by using traditional unconscious devices like dreams. The repertoire multiplies both by the addition of new tunes and by the gradual differentiation of tune variants until they become new tunes. The process of differentiation is aided by the wide variation in tune titles and the periodic experimentation with recasting tunes in different "keys," enabling tune variants ultimately to stand side by side in the same regional repertoire.

The repertoire of all of the older regions dates from the 18th century. Though a few tunes may be older, they are not older in their modern instrumental form. The 19th century greatly swelled the repertoires of all of the larger regions of the English-speaking world, but the American regional styles seemed to expand their repertoires exponentially. The Northern and Southern styles are paralleled by Northern and Southern repertoires with surprisingly little overlap until the modern media fostered interregional sharing. The Northern repertoire was to an extent sustained by a vigorous print culture for fiddle tunes. In the South, where musical literacy was confined to the church and the cosmopolitan parlor, printed music had virtually no influence on the larger course of tradition. Meanwhile, the repertoires of Canadian fiddling traditions, including the French traditions, were deeply influenced by the pervasive influence of Irish fiddling.

The older British American fiddling tradition is essentially a solo tradition. By the 19th century, however, the fiddle began to appear in ensembles. Southern tradition generated and lent to popular music the fiddle-banjo ensemble, the banjo being an originally African instrument that took root in the Upper South. Elsewhere, the fiddle began to be accompanied by the pianoforte or the accordion. With the migration of the guitar from parlor to porch in the 20th century, fiddle-and-guitar duos became popular, especially in the South. In general, the fiddle has been part of every kind of ensemble, including jazz bands, and almost always maintains a lead role. The traditions of Southern string bands, bluegrass, and Western Swing bands have perhaps led to the fullest integration of fiddling into a larger ensemble context.

Despite the ubiquity of the Italian violin as a model and the omnipresence of inexpensive store-bought violins (Sears Roebuck Company distributed violins from its catalog by the early years of the 20th century), homemade fiddles have never disappeared from the American scene. From Southern gourd fiddles through the cigar-box fiddle (really a device for children), some homemade fiddles have kept alive the ancient idea of the fiddle as a modest and structurally variable bowed instrument. Meanwhile, other makers have adopted and adapted the Italian model, and their handiwork is readily encountered at fiddlers' conventions throughout the United States. Often the local repairer of fiddles is also an occasional maker of new instruments. It is a testimony both to the popularity of fiddling and to the cross-cultural fascination with the shape, form, and resonance of a violin that violin making continues to thrive as a home art.

The titles of American fiddle tunes are a rich domain for creative expression. Some, like "Bonaparte's Retreat" and "Hull's Victory," commemorate historical events

(especially battles) and personages. Many, especially in the South, commemorate places, geographic features, natural phenomena, or the vibrancy of the seasonal round (“Waynesboro,” “Three Forks of Cheat,” “Forked Deer,” “Frosty Morning”), conveying through the fiddler’s repertoire, publicly announced, a celebration of sense of place and way of life. Some are named after local persons, including other fiddlers or authors of tunes. Many are named after women. Many are playful, and some of these are obscene (“Dog Shit a Rye Straw”), with the associated obscene verses in turn generating playful title substitutions (“The Dog in Difficulty”). With some regularity, the titles are rhythmic and assonant in a way that seems to evoke the music itself. All in all, American fiddle tune titles, with their knack for celebration, evocation, and playfulness, amount to a sort of imaginative triumph in the art of naming.

As a popular and imagination-provoking instrument, the fiddle is the subject of an array of associated lore. Stories connecting the fiddle with the devil are widespread, and its association with the devil has perhaps prevented its adoption for religious services, even in churches in which electric guitars and drums are safely in the fold. In the South and sometimes elsewhere in America, fiddlers insert rattlesnake rattles into their fiddles. There are legends surrounding the fiddle or in which a fiddle is central. Among fiddlers, the music connects up memory in a thousand ways, and fiddlers often pepper their performances with associated stories and anecdotes that amount to a sort of running contextualization of their art.

The fiddle has historically been a man’s instrument; though a few women have always played the fiddle, the late 20th century provided the first generation with numerous women fiddlers of the finest caliber within their regional or ethnic traditions. Hence, much of the lore surrounding the instrument is a sort of men’s lore, and some men describe the fiddle itself in feminine terms. It remains to be seen how the character of that lore may shift as women become central to the perpetuation of fiddling as an art.

The fiddling contest, a traditional cultural event honoring fiddling, has a documented history spanning two centuries in America. In the 20th century, fiddlers’ conventions, incorporating the fiddling contest but broadening to include a variety of musical and dance traditions, have been popular throughout the country. Also notable in the 20th century (though largely absent in the South) is the sprouting up of dozens of state and regional fiddlers’ associations, which sponsor conventions, publish newsletters, sell records, tapes, and souvenirs, and otherwise provide a modicum of modern organization and “networking” to fiddlers and fiddling enthusiasts. The continuing popularity of fiddlers’ conventions and fiddle records, and the renaissance of dance styles that employ fiddle music, seem to assure that the fiddle will maintain its central role in American folk music in the decades to come.

Fieldwork

Observing and documenting people where they are and doing what they do, one of the three major modes of acquiring primary information in the social sciences. (The other two—statistical surveys and decontextualized interviews or performances—are rarely used in primary folklore studies.) Fieldwork information is gathered with various media: notebooks, film and video cameras, and audio recorders. Fieldworkers may be after material in active tradition (things people do now) or material in passive tradition (things they know and recognize, and may even have an aesthetic for, but wouldn't, unless solicited, perform or utter). Fieldworkers may join in the events going on ("participant observation"), or they may pretend to be totally outside them (but, except for large community events, like festivals and parades, it is difficult for a fieldworker to be totally invisible). They may be active in their pursuit of information (interviewing, asking for items, asking for explanations), or they may be passive (waiting, observing, recording).

Fieldwork is the key research act for most scholarship in folklore, anthropology, and oral history. More than thirty years ago, Richard M. Dorson wrote, "What the state paper is to the historian and creative work to the literary scholar, the oral traditional text is—or should be—to the student of folklore" (Dorson 1964:1). Although few folklorists now would limit the field-gathered information to "texts," and many wouldn't agree on what the word "text" means any more, Dorson's observation still holds true.

Some folklore studies use preexisting print or electronic media as the source of primary information (studies of the apparent scope, character, and function of folklore materials in commercial advertising or political speeches, say, or folklore in the works of Homer, Shakespeare, or Mark Twain, or folklore on the Internet), but such studies are predicated on ideas of folklore derived from fieldwork. The hypothetical and theoretical work by Milman Parry and Albert Bates Lord on the nature of Homeric performance and composition was extrapolated from their extensive fieldwork among Serbian epic singers. They were able to assert that certain aspects of classical texts were grounded in folklore performance and transmission only because their fieldwork let them understand the character of such performance and transmission.

Even folklore scholars whose work is totally theoretical are dependent for the substance underlying their generalizations and speculation on the fieldwork of others. It would be difficult, if not impossible, to theorize cogently and relevantly about the meaning of folklore in a community unless someone had first gathered information about what folklore exists in that community and what functions the folklore has. Comparative folklore studies (texts or behaviors from different places or times compared for differences in aesthetic or functional aspects) are predicated on the quality and scope of fieldgathered material.

Folklorists doing fieldwork may be after specific genres

or kinds of folk behavior: ballads, recipes, survivals of older traditions in modern communities, modern folkways in technological communities, the nature of folk performance. But it is difficult to know the social meaning of an item of performance without knowing about the conditions of performance. One interprets, for example, the place and function of ballads in a community differently if there are many people in that community who sing many long ballads on a regular basis to a wide local audience that knows and enjoys such ballads, or if the performers sing their songs only when collectors come in from the outside to solicit them. The words and tunes may be the same, but what we make of them will vary. One may analyze and value a particular ballad text differently if it was learned from a book, a recording, a school chum, or a grandparent.

Early folklorists often examined texts alone, much as some literary scholars examine texts of poems as freestanding items. Examination of folklore texts without consideration of collateral information now is rare. Only fieldwork can gather the items, provide information for identifying folk genres, and locate the character of folklore performance in ordinary life.

It is not just that scholars are more sophisticated now about the questions that might be asked; it is also that the equipment available now frees the fieldworker to ask more sophisticated or multidimensional questions. When fieldworkers had to take down all words by hand, approximations of texts or tunes were sufficient. Now that machines

capture the words and music, fieldworkers examine context. They examine not just the joke, but who tells which jokes to whom and under what circumstances. How are the jokes interpreted? What part do those jokes play in the social event going on? How does that redaction of that joke relate to others made of the same words? Is the meaning the same if the context is different? What is the relation between observer and observed? The reflexive movement in field sciences in recent years (cf. Clifford and Marcus 1986) is predicated on a technology that could document the observer at the same time it documented the observed.

Fieldwork has always been a technology-driven endeavor. The kinds of questions one asks of field-gathered material are predicated on the kinds of information that can be gathered in or brought home from the field. Fieldworkers approaching complex events will define their options differently if they have at their disposal and know how to use effectively and efficiently various kinds of image and sound recorders. Fieldworkers studying material culture have different questions and, therefore, may incorporate different technologies than fieldworkers interested in narrative tradition or matters of custom or belief. Fieldworkers trying to document the folklife of a community may need a wider range of technical expertise than fieldworkers focusing on genres or items.

Nineteenth- and early-20th-century folklorists depended on simple recording devices and techniques: notebooks, memory, sound cylinders, and disks. They used bulky devices to record musical performances on cylinders and then on large flat disks. Such machines were capable of recording only a few minutes of performance before they had to be wound up and supplied with a new recording surface. Unless the recordist struck a tuning fork or other device of known frequency at the beginning or ending of the recording, there was no way for a listener to know exactly what speed these recordings were to

be played. Listeners, therefore, never knew if they were hearing the recording at the right tempo or pitch. Because the equipment was so bulky, movement was difficult and performers often had to be brought to where the machine was located. Cameras used large glass plates and required a great deal of light or a long static time to work.

What the great folklorists of the 19th and early 20th centuries provided us were not so much records of performances, but rather interpretations or versions of performances: They were not only editors of what they found, but also participants in the line of performers they documented. When, say, Vance Randolph spent an evening listening to stories or songs and then went home and wrote up the stories he had heard or sat at the

piano and worked out tunes of songs he had heard, he was doing exactly what many folk performers do.

Fieldworkers in the 1990s can gather more complex field documents because they have at their disposal instruments that provide a record of transient detail impossible a half-century ago:

Small automated 35mm cameras weighing less than a pound zoom from wide-angle to telephoto, focus and set apertures automatically, using film capable of making images in moonlight.

Video cameras easily held in one hand record high-quality images in low light with high-fidelity stereo sound on tapes and rechargeable batteries each lasting two hours. Some of these cameras have stabilization electronics that compensate for horizontal and vertical shake, which means deep zoom shots that only a few years ago were impossible without a tripod can now be done on the fly.

Audio recorders controlled by crystals, the tapes from which are therefore replicable on any crystal-controlled machine anywhere, and, for the really sophisticated, Digital Audio Tape (DAT) machines with real-time coding, produce recordings of great accuracy and dynamic range.

A fieldworker can go out with a full complement of this new equipment—video camera, still camera, crystal-controlled audio recorder, enough tape for a dozen hours of video and sound recording, and enough film for hundreds of separate images—in a shoulder bag.

The effects of all of this technology are multifold. First, the fieldworker is capable of acquiring enormously more information than was ever possible previously. Before mechanical means of reproduction were available, every documentation of even the simplest text was at best an approximation, what someone could write down about an event that could never be redone exactly. With early means of reproduction, it was possible to get crude audio recordings and photographic images made in a narrow range of situations. With modern equipment, it is possible to get extremely accurate sounds and images in a wide range of situations.

Second, the fieldworker has been freed of the need to concentrate on the capture of items (the machines do that very well) and thus allowed to consider more complex questions, such as the way various parts of performance or enactment interrelate or minute complexities of performance itself. The performance analyses of Dennis Tedlock (1983), for example, are impossible without accurate recordings that can be listened to again and again on equipment that lets the analyst find exact moments in performance.

Third, the problem of how to get information has been replaced by what is to be done with the great mass of information so easily acquired. A 19th-century collector of ballads or narratives had no difficulty managing information back home: It was easy enough organizing the songs and stories and providing simple annotations giving the specifics of performance. A 20th-century fieldworker coming home with videotapes, audiotapes, and photographs of a complex event has a far more difficult job of documentation, storage, and analysis. Those machines that are so good at getting information weigh us down with the information they provide.

In the field, the researcher looks at a world of nearly infinite possibility: so many songs, dances, stories, images, recipes, redactions, processes, interactions, moments, movements, facial expressions, and body postures. Once home, the researcher deals with

a world of specific and limited possibility: the kind, quality, and range of information brought home, no more, no less. What isn't in the notes, on the film or tapes, or in memory is gone. Subsequent analysis will be predicated not on what existed out there in real life, but on what made it back. Since field documents may be used in studies never envisioned by the fieldworker at the time of the fieldwork, and since analysis may occur long after memory has had time to impose its confusions, proper documentation is of key importance in all fieldwork projects. Without notes on who was doing what and under what conditions the documentation and event occurred, sound recordings, videotapes, and photographs may in time be virtually useless.

Fieldworkers also deal with the problem of preservation. A large portion of the audio cylinders made early in the 20th century have turned to carbon dust. No one knows how long information on audiotapes and videotapes will last. Audiotapes made in the 1960s often have problems in the 1990s of the recording material pulling away from the backing. Notes made with felt-tip pens fade. The most lasting form of documentation is graphite pencil on acid-free paper. Such paper is enormously resistant to decay (left alone, it lasts centuries), and the graphite particles are imbedded in the paper fiber and are not subject to fading or oxidation.

The immediate result of fieldwork is the acquisition of various kinds of documentary materials. A long-term result is involvement in a range of ethical questions and responsibilities. To whom does the material one brings home from the field belong? What obligations are there to privacy and ownership? Who is owed what if material is used in a book, or a recording, or documentary film? What obligations obtain toward other collectors working in the same area or on the same materials? Fieldwork is only one part of a complex series of personal, intellectual, and ethical acts and decisions.

Fiesta

Structured celebration at which much traditional behavior is observable. The Spanish word *fiesta* means “celebration,” “party,” or “feast.” In traditional Mexican and Mexican American culture, a fiesta is a Catholic religious celebration, often taking place on a Saint’s Day or some other holy day. Although each fiesta is unique to its particular time and place, most fiestas share some or all of a cluster of traditional activities.

Mass is usually celebrated in the morning or early afternoon of a feast day. A procession often follows Mass. The image of the saint being honored is carried out of the church, through some of the streets of the community, and back again into church. In some communities, elaborate temporary decorations are placed along the route where the procession is to pass. These include homemade lanterns of colored paper, floral arches, and designs applied to the street surface itself.

Ritual dancers and musicians may accompany the procession, or may perform in the churchyard at any point during the day. These dances may or may not include elements of ritual drama. Examples of such dances and ritual dramas include the dances of *los Indios*, *los Matachines*, and *los Aztecas*, and the dramas of *la Conquista* and *los Moros y Cristianos*. Ritual performers may come from distant towns to dance at an important fiesta, while smaller fiestas may only attract local dancers and musicians.

Commercial activity also has a place at community fiestas. All sorts of sacred and secular trinkets may be purchased at temporary stalls that have been set up in the plaza in front of the church. Horse races and other traditional sports as well as gambling are often fiesta activities. Feasting, either sponsored by the church organization or made possible through the sale of foods at stalls, is also an important part of fiesta behavior. This feasting often includes the consumption of alcoholic beverages. Finally, many fiestas include a social dance as an important, culminating event.

In many communities, especially those with indigenous roots, the fiestas are organized and paid for by an elaborate hierarchy of officials who change regularly. Another strategy for raising the necessary money is to lease space in the plaza or streets to merchants.

In the 1980s, the *Fiesta de San Lorenzo* (St. Laurence, martyr, August 10) in Clint, Texas, began with a morning mass. After mass, the statue of the saint was carried on a large circuit of streets around the church, accompanied by musicians playing and singing traditional religious songs and by Matachines dancers. Matachines also danced in front of and beside the church after the procession. Meanwhile, in the plaza in front of the church, traditional festive foods were sold from stalls operated by local individuals and charitable organizations. Other stalls offered trinkets and games of skill. A dance took place in the evening.

Other fiestas will have other characteristics, and may last for several days, attracting pilgrims from great distances. All share some or all of the cluster of traditional activities outlined above.

Fife, Austin E. (1909–1986)

Folklorist with a particular interest in Mormon folklore, cowboy and Western songs, and material culture. The grandson of Mormon pioneers, Fife grew up in Utah and Idaho. His academic training was in French language and literature at Stanford and Harvard Universities, and most of his professional career was in this field. A student of Aurelio M. Espinosa, he became interested in folklore and pursued the study of it as an avocation, eventually becoming an acknowledged expert.

Fife held academic appointments at Occidental College, Indiana University, with the U.S. Air Force (as a historian) and the U.S. Department of Education, at UCLA, and at Utah State University. He received a Fulbright grant to lecture on American folk music in France in 1950, a Guggenheim Fellowship for the study of cowboy and Western songs in 1959, a National Endowment for the Humanities senior Award in 1971, and a Distinguished Service Award at Utah State University (USU) in 1976. Fife was a Fellow of the American Folklore Society and of the Utah State Historical Society, elected to both in 1968.

In 1972 he established the Fife Folklore Archive at USU with the gift of his private library, his field notes on Mormon folklore and on cowboy and Western songs, his acetate and tape recordings, and his slides and photographs of material culture—primarily fences, hay derricks, stone houses, mailboxes, and gravestones. Many of his early recordings of folk music and lore are deposited in the Library of Congress in Washington, DC. In addition to several published books, often written in collaboration with his wife, Alta S. Fife, he wrote many articles for folklore and historical journals.

Filipino Americans

Immigrants (and their descendants) from various ethnolinguistic regions of the Philippines, especially the Ilocos, Tagalog, and Visayan Provinces. The largest Filipino communities in the United States started in Hawaii and California during the first quarter of the 20th century while the Philippines was an American territory. The influx of thousands of predominantly young, single, male agricultural workers during that time has been augmented since the mid-1960s by even larger numbers of immigrants, including entire families and professionals of both sexes, who reside with their descendants, in urban centers throughout the country. Filipino American folklore reflects the marked differences in the American experience of these two waves of immigrants.

The early immigrants, known as “old-timers” (abbreviated as “O.T.” in Filipino folk speech), were lured to the Western states by “drummers” of shipping lines, and by photographs, enclosed in glowing letters from relatives and friends, showing young *Pinoy*s (Stateside Filipinos) sporting tailor-made *Amerikana* suits, silk shirts, wing-tip shoes, and Panama or Stetson hats. From their poverty-stricken villages, young men caught in the “Hawaiian Fever,” or, in dreams of an “Eldorado” in California, sought passage on the Dollar Lines, bringing with them no more than their basket of clothes, with perhaps a bottle of shrimp or fish paste to flavor their monotonous diet aboard the ships.

These ocean journeys, along with more journeys on land, still are the subject of storytelling by the elderly *manong*, as the old-timers are called. The narrator vividly reviews the routes of his occupational life—cutting sugarcane and harvesting pineapples in Hawaii; following the crops from Washington state to Mexicali while picking hops, thinning lettuce, planting celery, “stooping for the green gold” of asparagus, harvesting grapes, strawberries, and apricots; then returning north to the canneries and to the salmon-fishing season in Alaska. Drifting to the cities in winter, exiled in cheap hotels in Chinatown or “Manilatown,” his dreary life was punctuated with brief forays into gambling casinos, pool halls, taxi-dance halls, and brothels.

Since miscegenation laws forbade marriage to White women, and few Filipinas immigrated, he remained a bachelor. At labor camps, he bunked with other lonely unmarried men. With them, he enjoyed boxing, cockfighting, and other male sports. Racial attacks, which, for instance, killed a bunkmate during the anti-Filipino riots in Watsonville, California, in 1930, ensured his isolation at work and at play.

From the *Alaskero* to the *Hawaiiano*, Filipino migrant workers share a common repertoire of personal narratives, as well as legends, jokes, and folk speech. Legends feature a migrant worker who does the work of ten grape pickers and eats the tortilla and pork chops prepared for forty men. Dialect stories, jokes about the immigrant greenhorn (such as the Pinoy who drew a map of the kitchen when told to mop the kitchen floor), and protest tales about the labor foreman or the ship’s captain (whose vengeful Filipino steward served him coffee brewed with the latter’s smelly socks) follow traditional structures and motifs but revolve around their work life. Still to be documented from the

workers themselves are the stories of houseboys, waiters, bellhops, and other service workers among the early immigrants, as well as the experiences of

Filipino dancers at the Civic Center Plaza Ethnic Dance Festival. Chicago, 1977. Photojonas Dovydenas. Americand Folklife Center.

latter-day housekeepers, garage attendants, nurses, and office workers in Filipino American communities everywhere.

The folklore of the new immigrants, unlike that of the bachelor pioneers, revolves around the family, the church, and community organizations—institutions designed for the preservation and transmission of cultural traditions. The home is the main transmitter of cultural identity. Stories from their own childhood are retold by the older to the younger generation. In many Catholic homes, the altar, with its assemblage of favorite Catholic saints' statues, serves as a reminder of family unity.

Rites of passage such as baptisms, birthdays, weddings, anniversaries, and funerals, which reunite relatives and friends from far and near, reinforce kinship ties. Ritual kinship established by cosponsorship of godchildren at baptisms and weddings extends the interdependent unit. The Filipino definition of family is flexible and adaptive. Those without families, like the early immigrants, become ritual or fictive "aunts" and "uncles."

The Filipino sense of community likewise is elastic and expansive. It is rooted in an ever-widening circle of *kababayan* (people who come from the same place). A Filipino may belong to several different clubs—one composed of his covillagers or townspeople, another consisting of province mates, and still another, which comprises his whole

region. His strong attachment to his place of origin is a key theme in the proliferation of community clubs around which social activities revolve. Most of these clubs sponsor town and provincial fiestas in honor of their respective patron saints.

Community celebrations are marked by the usual cultural displays characteristic of many other ethnic festivities. Unlike family affairs, which usually are exclusively Filipino, community festivals are intended for other groups as well. Foodways, folk dances and music, as well as a selected array of traditional arts and crafts, are associated with various celebrations from saints' feast days to national holidays. Although family affairs often are gastronomic feasts, public events tend to have a scaled-down, stereotyped menu with the favorite triumvirate of *pancit* (a noodle dish), *lumpia* (a kind of egg roll), and *adobo* (chicken or pork stewed in spices and vinegar). Along with these foods, folk dances, especially the *tinikling* bamboo dance (also taught as a recreational activity in public elementary schools), the music of the *rondalla* (string band), and the folk art of making the *parol* (festival lantern) have become stereotyped features of community festivals.

Parades and processions, traditionally held during national holidays and religious feasts, respectively, have turned as well into presentations of ethnic cultural heritage. In addition to the American-style drum-and-bugle corps and floats bearing city dignitaries, parades often feature Filipinos costumed as northern Luzon hill tribes, Mindanao Muslims, and Christian lowlanders—ethnocultural categories promoted by local and visiting dance troupes as an instance of cultural richness and diversity. Also highly popular is the *Santacruzán* (a religious procession of community club beauty queens who represent important titles of the Virgin Mary). Traditionally held in May, the *Santacruzán* has become a regular feature of many other community events, including those held during city-sponsored cultural-heritage months. Community celebrations, while continuing to be reunions of compatriots, also have become collective expressions of ethnic pride and identity.

The family, the church, and community clubs, along with ethnic-heritage schools that teach folk dances, music, and arts and crafts, are the active preservers and purveyors of tradition for new generations of Filipino Americans.

Filk Music

The musical tradition of science fiction (SF) and fantasy fans. "Filking" occurs at science-fiction conventions ("cons") and creates a specialized social context and identifying role (the "filker") for its practitioners. It fuses elements of traditional folk, folk-revival, and popular music with lyrics oriented toward SF, space, and political parody. Participants define filk as "music played in a filk room," and a filk room as "a place where you play filk music." This circular definition precisely defines the music and its social context for participants who share the music and fellowship.

In the 1950s, fans actively interested in folk music, especially folk-revival styles, began bringing instruments (primarily guitars) to cons to play for their own amusement. During this period, a typo in a fanzine transformed a "folk sing" into a "filk sing," and the unique term was adopted immediately. Early filk gatherings drew fewer than ten people, who knew few songs, and who performed for each other in hotel rooms, furnace rooms, stairwells, and service halls. Gradually, filkers began writing original lyrics set to known tunes and, later, to original tunes as well. An early example is the traditional "Eddystone Light," a song about a lighthouse keeper, updated and transformed to "Asteroid Light."

In the late 1970s and early 1980s, filkers began demanding time and space at conventions to play music. Today almost all cons feature filking, and by 1993 seven annual conventions devoted to filking had emerged in the United States, Canada, and Great Britain. Filk's popularity has grown to include several filk fanzines, computer bulletin boards, and at least seven cottage-industry studios that produce and sell both live and studio-recorded tapes and CDs. As performers and recordings became more professional, filk received radio air play nationally and internationally, especially on novelty music programs like "Dr. Demento."

Filking normally takes place at cons on Friday and Saturday nights, in a room or rooms set aside for it, beginning about 10:00 P.M. and often lasting until dawn. Filk concerts have become common, spotlighting a performer or group, and "jamming" is also becoming popular. The instrumentation has expanded from acoustic guitar and voice to include almost any instrument, including both ethnic and electric/electronic instruments. Performing duos, trios, and groups are becoming common. Topics include SF texts (both literary and mediaderived), current events, the SF community, personal experiences, and jobs, especially those in high-tech fields. Spaceflight and hope for the future are common themes. Leslie Fish's "Hope Eyrie" (a tribute to the first moon landing) has become a filk-room anthem, sung unanimously in complex harmony: "The Eagle has landed, /Tell your children when. /Time won't drive us down to dust again."

At least three distinctive regional styles of filk performance exist in the United States, with some overlap. "Singalong" (East Coast) involves participants singing from songbooks directed by a song leader. "Chaos" (Midwest) is a free-associating flow of musical styles, moods, and themes, governed primarily by implicit etiquette. "Bardic circle" (West Coast) follows a formal code of "pick, pass, or play." Performing ability ranges from beginner to professional, but imaginative writing (especially lyrics) and good filk-room manners are valued above sheer technique.

In folk the social context is as important as the music; self-expression, play, and sharing are paramount. This aesthetic is shown by the absence of a fixed distinction between performers and audience. Participants may sing along on choruses or during entire tunes, make jesting comments, and participate in “schtick.” Many fans prefer live folk tapes to studio tapes because these remind them of the supportive social atmosphere of the folk room.

Film and Folklore

A field of study within the discipline of folklore; films used to document or present folklore. Films that are edited to be shown to an audience are called “folkloric films” by Sharon R. Sherman. Video is often subsumed under “film and folklore,” and with its increasing use, “folklore and video”—or perhaps “folkloric videos”—may become a commonplace term, perhaps incorporating film within its definition, much as film now does for video.

Like the documentary “films of fact” shot in the 1900s, some American folkloric films are made up of short clips of interesting phenomena captured for posterity. Other folkloric films have a heavily narrated expository style similar to documentaries made prior to World War II and lasting through the 1960s. Certain folkloric films utilize either a *cinéma vérité* or a *post vérité* approach that combines synchronous sound or voice-over with linear depictions of folklore as events (including interactions, performances, and creative processes). Yet other films are reflexive and intersubjective, incorporating the filmmaker as one of the subjects.

Many folklorists who use film are tied to the models adopted by their documentary-film forerunners and to the conceptual premises of past folklore scholars. Thus, in folkloric films, the rural often takes precedence over the urban, and the past assumes greater importance than the contemporary. For example, John Cohen searched for Child ballads in Appalachia and documented folksinging in *The High Lonesome Sound* (1962); Les Blank documented little-known peoples in the once isolated regions of America, such as Cajuns and Creoles in the Louisiana Bayou, in *Dry Wood and Hot Pepper* (1973) and *Spend It All* (1970); and Bill Ferris presented musicians in rural Mississippi in *Gravel Springs Fife and Drum* (1971). However, these filmmakers have examined contemporary activities and the urban scene as well. Usually, they began with a Romantic stereotypic notion of the folk for their initial films and then recognized a need to broaden the definition of their work as their film corpus grew.

Folklore filmmakers most interested in texts often employ the techniques of narration and montage, showing the viewer the means by which representation is achieved. The montage structure employed in such films as Ferris’ *I Ain’t Lying* (1975) and *Made in Mississippi* (1975), and in Blank’s food films (such as *Garlic Is as Good as Ten Mothers* [1980]), provides a means for discovering what the filmmaker thinks about the subject being documented. For historic-reconstruction films, such as Pat Ferrero’s *Hearts and*

Hands (1987), the narration may be assembled from the words of journal, diary, and letter writers.

Although many folkloric films document a community, such as Blank's *Zivili* (1987) about Serbian Americans, frequently American folklore filmmakers choose a biographical "Everyman" to represent the group. Blank, in several films, (such as *Yum, Yum, Yum: A Taste of Cajun and Creole Cooking* (1990); has Marc Savoy explain aspects of being a Cajun; Jorge Preloran looks at Luther Metke as an exemplar of both the elderly and the log-cabin builder in *Luther Metke at 94* (1979); Ferris documents James Thomas as a bluesman and a storyteller in *Delta Blues Singer* (1969) and *I Ain't Lym'* (1975); and Sherman presents *Kathleen Ware: Quiltmaker* (1979) and chainsaw sculptor Skip Armstrong in *Spirits in the Wood* (1991). Such folklore filmmakers have documented people as both cultural or artistic representatives and as unique personalities.

For folklorists, *cinéma vérité* (film truth), with its syncsound portable cameras, provided a fieldwork opportunity to document events from beginning to end and to test the theoretical perspectives about folklore as human behavior established the late 1960s. Long takes and sync-sound filming became the rage. At last, the people being studied could speak for themselves and provide their own functional analyses without the imposition of a narrator or scholar. The focus on the individual shown in such documentary films as *Showman* (1962), a portrait of movie mogul Joseph E. Levine, by Charlotte Zwerin and Albert and David Maysles; and *Don't Look Back* (1967), a D.A. Pennebaker film on Bob Dylan, became examples for folklorists of how filmmakers might document individuals to arrive at the "truth."

Those films that acknowledge their power to seemingly represent experience and reveal the means by which they do so go beyond the ideals of *cinéma vérité* into the openly subjective realm of what Sherman has named "*post vérité*," in which the art form of the documentary is a given. Whereas *cinéma vérité* was art masquerading as objectivity, *post vérité*, unmasks the illusion of objectivity and displays it. For example, in *Gimme Shelter* (1970), a documentary of the Rolling Stones concert tour of America, flashbacks confuse what is "real"; in *Woodstock* (1970), an observational camera style is fused with split-screen images, sound mixes, and rhythmic shots chosen for their balance with the audio track. The long takes disappear into edited rhythms, as they do in Roberta Cantow's folkloric film *Clotheslines* (1981). The interview, abhorred by *cinéma vérité* for proclaiming the constructed nature of film, may occupy a central role in *post vérité*, as in such folkloric films as Tom Davenport's *A Singing Stream* (1987), Judy Peiser's *All Day, All Night: Memories from Beale Street Musicians* (1990), and Paul Wagner's *The Grand Generation* (1993). For *Paris Is Burning* (1991), Jennie Livingston creates a *post vérité* film from a melange of interviews, *cinéma vérité* techniques, and inter-titles.

In the United States, for the most part, *cinéma vérité* films were used to tell the stories of the "other people," those without access to media production. With *post vérité*, the "others" may become the cinematic weavers of their own stories, directly addressing the camera as the "experts." In recognizing the blatancy of film as art, *post vérité* films may also cross into the realm of reflexivity. For example, Zulay Saravino takes over the making of a film about her culture and turns it into one about her own transcultural experiences in America and Ecuador in *Zulay, Facing the 21st Century* (1993). In the film, Saravino shows herself editing the film about herself.

Unlike documentary films that look at people within the filmmaker's own society, films that Sherman calls "ethnodocumentary" are a specific type of documentary film that tends to document the "other"—people who are conceptualized as being unlike the film team or the ethnographer. As ethnographers become less concerned with cultural overviews and more interested in *events* in culture (a feast, a funeral, a festival), their films have become more like folkloric films. The folkloric film focuses primarily on traditional behavior, documenting many of the most fundamental features of our lives and ranging widely from rituals, ceremonies, and folk art, to folk narrative and folksong, to the lore of various peoples bonded by ethnicity, age, gender, family, occupation, recreation, religion, and region. The folklorist, as Richard M. Dorson has pointed out, often conducts fieldwork at the folklorist's "back door." Many folkloric filmmakers have, indeed, examined traditions in their own locales, sometimes even among their own families.

Differences of major emphasis and locale set the folkloric film apart from other documentary-film traditions, although *any film* having folklore content might aptly be called a "folkloric film." Just as anthropologists define certain films as "ethnographic" when they successfully elucidate anthropological approaches, the true folkloric film may be defined as one whose content deals primarily with topics that folklorists study and whose intent is to meet the dictates of folkloristic research and teaching. Such films include ones created by folklorists themselves or by nonfolklorists who are filmmakers or videographers recording folklore. Put simply, the point of these films is to document folklore, no matter who is making them.

A unique twist to the study of film and folklore is the popular use of folklore as the primary plot line or unifying thread for commercial feature films. *The Serpent and the Rainbow* (1988), for example, exploits the practices of voodoo. The urban legend about a baby-sitter frightened by a telephone caller is the basis for *When a Stranger Calls* (1979). The film *Avalon* (1990) plays upon family and ethnic narratives to structure the larger narrative of family and ethnic-neighborhood dissolution in the America of the 1940s through the 1960s, using one family as exemplar. *When Harry Met Sally* (1989) relies on the courtship narratives of many different couples as a transition device.

Memorable in its re-creation of folklore is *Candyman* (1993), in which a folklore graduate student conducts research on the legend or horror tale of "The Hooked-Arm Man," who has scared teenagers in lovers' lanes for decades. In this film, the legend comes to life, and the man with the hook torments the graduate student. With the popularity of Jan Harold Brunvand's books on urban legends, this genre of folklore is familiar to a vast audience, and thus viewers have undoubtedly seen the irony.

Nonacademic feature films in general release often incorporate folklore as a detail—for example, a woman singing "Barbara Allen" (Child 84) in *The Piano* (1993). Animated films, such as *Anansi the Spider* and *John Henry*, are targeted at the educational market. But the folkloric films perhaps the most popular with general audiences are Walt Disney's animated *Märchen* [fairy tales]. From *Snow White and the Seven Dwarfs* (1937) to *Cinderella* (1950) and *Beauty and the Beast* (1991), the Walt Disney Studio has presented a number of "Disneyized" folktales to huge audiences. Viewers may accept these renditions as the original tales, an idea reinforced by the same images repeated in spin-off products such as books, dolls, games, and other toys.

Folklore becomes a thematic wellspring for films. Folk beliefs about vampires and werewolves have spawned a whole genre of horror films. Folk-like heroes and plots emerge in stories created or adapted from books by screenwriters, films such as *The Never-Ending Story* (1984), *The Princess Bride* (1987), and *Friday the 13th* (1980). Other visual forms of popular culture appropriate themes such as “the quest,” “journey,” or “adventure” found in folktale and epic, reconfiguring them in video and computer games.

The video camera, like the movie camera before it, has changed the way people document their lives. In essence, what filmmakers and videographers choose to record in both professional films and “home movies” or amateur videos often involves presenting a vision of the self by documenting the central aspects of life, such as rites of passage (birthdays, bar mitzvahs, graduations, weddings); calendrical and religious holidays (Christmas, Passover, Mardi Gras); and performance events (from children’s sports to ethnic festivals). Folkloric films also create biographies of individual folk artists, documenting the traditional processes in which they are engaged (for example, play activities, folksinging, craft creation). These subjects form the key narratives of the folkloric film and the folkloric video, which build upon these “narratives of life” by explaining how such events and processes function in the lives of those depicted.

Fink, Mike

Riverboatman and legendary folk hero. Mike Fink was probably born in Pittsburgh, Pennsylvania, during the last quarter of the 18th century. He evidently lived a colorful life as a boatman on the Ohio and Mississippi Rivers. He is thought to have died around 1823 as a result of a personal feud. Although he does not appear in conventional histories of the early 19th century, there is some indication that he was for several decades a well-known individual around whom anecdotes and legends clustered, expanding his personality into an image of an exclusively American backwoods hero. Associated with this image was a personality characterized by rough ways and exaggerated speech and behavior, which appealed to the American aesthetic conscience of the middle part of the 19th century. Constance Rourke referred to this type as "The Gamecock of the Wilderness." Mike's exuberant and explosive ways were too confined by civilization to make either comfortable around the other. But at a distance the backwoodsman seemed amusing and even intriguing. It was as if a new, white-skinned, noble savage had emerged. Richard M. Dorson described these characters as "nineteenth-century Ring-tailed Roarers, bullies, brawlers, and daredevils," who could shoot farther, jump higher, dive deeper, and come out drier than any man this side of Roaring River. Walter Blair characterized Mike Fink as "half horse and half alligator" (Blair and Meine 1956).

Alphonso Wetmore's three-act farce *The Pedlar*, written in 1821, gives the first known reference to Mike Fink, who appears in the play as a stereotype of the uncouth boastful river man. Mike Fink is known today almost exclusively from similar printed sources of subliterate works of the 19th century, including almanacs and sporting journals. Many of the writers who produced these stories about Mike Fink claimed oral sources for their accounts. Several of the Davy Crockett almanacs contain anecdotes about Mike Fink, usually referring to "the celebrated Mike Fink" and always carrying the assumption that the reader has heard of the "Roarer." Writers of these backwoods tales and other humorous regional sketches often credited an eyewitness as a source for their creative journalism, although some of the writers actually heard their basic facts from narrators who told them orally as anecdotes. Mike Fink was known during the early 19th century in a vigorous oral tradition and was once a "folk" hero.

Certain episodes about Mike Fink recur. Mike demonstrates prowess with his rifle by shooting a cup of whiskey off the head of another boatman, or in some cases the head of his wife. Sometimes the compliment is returned by another sharpshooter. This practice even plays a part in his own death, by most accounts, when he shoots at the cup on the head of his protégé after a disagreement and either accidentally or intentionally shoots him dead. Mike is then killed in revenge by the boy's friend or relative. Other common episodes include shooting the scalp lock off an Indian's head and removing a Negro's protruding heel by a surgically precise shot.

In some ways, Mike Fink is of the same ilk as Davy Crockett. Mike appears in several episodes of the Crockett almanacs, having some encounters with Davy himself. Dorson showed that Davy's portrayal in the almanacs sets him in an early American "Heroic Age." Mike Fink's portrayal sets him in this same age. His vainglorious boasting and self-confident challenges are quite similar to those of Crockett. They both are "Roarers."

While Mike can match Davy in some heroic aspects—he can boast as well, fight as fiercely, and his rifle is a match for Davy’s—he lacks Davy’s heroic qualities in others.

In later accounts, Mike is drawn to be even less heroic. Beginning in 1850, most stories written about Mike’s fights had him defeated, his colorful braggadocio now turned to bluster. The circulation of Mike Fink legends diminished greatly with the advent of the Civil War, partly due to the changing sensibilities of the American people, no longer amused by the inglorious aspects of his death and the more negative presentation of his character. Later, the life of the keelboatman that Mike Fink personified was no longer relevant to a modern age of transportation.

In the 20th century, Mike Fink lived again, but in a dubious resurrection. Colonel Henry Shoemaker, who wanted to turn Mike into a regional folk hero by stressing his Pennsylvania origins, claimed to have heard oral tales about Fink, but his claims have been widely discounted. Writers of children’s books and compilers of bedside companions cleaned up the distasteful elements of Mike Fink’s character and included him along with Davy Crockett in quaintly worded stories about “folk”-type heroes. But once again, Mike Fink was overshadowed by Davy Crockett, this time as a popular culture hero. Though Davy could be toned down to suit the bland tastes of the popular markets, including Disney portrayals as “king of the wild frontier,” Mike Fink appeared only as a minor character.

Finnish Americans

People whose ancestral origins in North America include family members who came from Finland and the Finnish-speaking sections of Russia, Norway, and Sweden. Most come from western Finland and are known simply as Finnish Americans or Finnish Canadians. However, Finnish Americans include people identified also as Finland Swedes, Finland Sami, Finland Karelians, Finnish Laestadians, and Finnish American Indians. All but the Finnish American Indians reflect separate folk communities also in Finland. These subgroups share a Finnish cultural geography, although the Finland Swedes speak Swedish and the Finland Sami speak Sami.

Finnish people participated in American colonial history, both in the New Sweden colony in Delaware after 1638 and in the Russian colony in Alaska in the 1840s. The Delaware Finnish colonists introduced a wooden log cabin dwelling using a dovetailed corner construction method whose influence intrigues 20th-century historical geographers. In Alaska Finns worked as carpenters and other skilled craftsmen. Finnish influences remaining in Alaska include the Sitka Lutheran Church and the carpentry work done by Finns on the Russian bishop's house, the most significant remaining building from the Russian American era. Sitka Finns later helped form Finnish communities along the Northwest Coast, in Seattle, Astoria, and San Francisco.

Modern Finnish American immigration to the United States began in 1864 and continued until 1924, when the immigration gates effectively closed to Finnish immigrants. By that time, 300,000 immigrants had settled in the United States. Finnish Canadian immigration began as second-stage migration from the States in the 1880s. Immigration directly to Canada from Finland began around the turn of the 20th century. After 1924 Finnish immigration to North America shifted to Canada until the Depression effectively halted most migration. Although some post-World War II Finnish immigrants entered the United States, most went to Canada, swelling urban Finnish communities in Thunder Bay, Toronto, and Montreal. At the beginning of the 1990s, 658,870 Americans identified themselves as Finnish Americans and 100,000 Canadians identified themselves as Finnish Canadians.

Most Finnish immigrants between 1864 and 1930 were general workers, people familiar with agricultural and unskilled labor but unfamiliar with industrial work or urban life. Men worked in the mining, lumbering, and fishing industries, and they joined railroad and dock work gangs. Before 1892 women who came largely joined their husbands or brothers; they provided essential services like room and board, shopkeeping, and managing the small farms they started with their husbands. After 1892, when the immigrants were largely young and single men and women, women came to do domestic work in the major cities while men found work in the steel industry, in logging, and in the coal-, iron-, and coppermining fields, primarily in the Upper Midwest and the mountain states. Artisans such as stone carvers, carpenters, painters, tailors, and jewelers joined this later migration, but the professional people who came were few, mostly journalists, teachers, ministers, political activists, and adventurers. In spite of the distances separating

the sexes, Finnish immigrants primarily married other Finnish immigrants, using newspapers ads and national summer festivals to meet.

The earliest Finnish immigrants, primarily Laestadians from northern Finland, around the Tornio River, and from northern Norway, arrived in 1864 to homestead prairie lands in south central Minnesota and in 1865 to work in the copper mines in Michigan. The first Finnish American communities, Cokato, Minnesota, and Hancock, Michigan, originated from these two groups of immigrants, whose letters home encouraged others to follow. By 1887, around 21,000 had arrived. Most 19th-century Finnish American urban communities formed in the Upper Peninsula of Michigan, in Minnesota, and in the Pacific Northwest. Finnish immigrants homesteaded in Minnesota, South Dakota, and along the Columbia River in Oregon and Washington. Urban communities originating with Finnish sailors also existed in San Francisco, New York City, and Boston. Immigrants created a prairie homestead community in New Finland, Saskatchewan, in 1889 and an urban community in Nanaimo, British Columbia, by 1890.

As immigration expanded, Finns moved across the northern tier of the United States. The permanent Finnish American settlements formed three regions—East, Midwest, and West—which further subdivided into twelve subregions: (1) New England and upper New York state; (2) New York City; (3) West Virginia, western Pennsylvania, and northeast Ohio; (4) southern Lake Michigan, including Detroit and Chicago; (5) the copper country, or the Keweenaw Peninsula, on Lake Superior in Michigan; (6) the iron-mining and cutover region of northern Michigan and Wisconsin; (7) the Minnesota Iron Range and the cutover lands adjacent; (8) western Minnesota and the Dakotas; (9) Rocky Mountain states (particularly Montana, Wyoming, and Idaho); (10) Oregon and Washington; (11) San Francisco and Northern California; and (12) Southern California and Arizona. Each region developed distinctive features based on variables such as where the immigrants came from in Finland, the time and place the region was settled, the employment options, and forms of interactions with American neighbors. In the 1990s, more than half of all Finnish Americans continue to live in the Midwest regions.

Migration between regions affected the cultures that developed. Many Finnish Americans, for example, trace their family's origins in the United States to Michigan's Keweenaw Peninsula, from which they then continued to migrate to other Finnish American settlements throughout the nation. Thus, the Copper Country developed a reputation (which continues) as the *pesäpaika* (nesting place) of Finnish America. In addition, from very early days Finnish Americans would settle farmsteads and maintain a seasonal migration pattern with a nearby urban area. For example, a rural area like Naselle, Washington, developed a symbiotic connection to Astoria, Oregon; Cokato, Minnesota, developed a similar relationship with Minneapolis/St. Paul; and Tapiola, Michigan, with Hancock. Later, mining regions in northern Minnesota developed connections to Duluth and Minneapolis, just as Upper Peninsula mining and rural communities developed connections to Detroit, Milwaukee, and Chicago. Thus, rural settlements maintained an urban perspective, and tradition dictated where children migrated when they left the farms.

Within these regions, Finland Swedes concentrated in Massachusetts, New York City, Michigan, Wisconsin, Minnesota, Oregon, Washington, and California. Sami peoples settled predominantly in Michigan, Minnesota, the Dakotas, Oregon, and Washington. Finnish American Indians live primarily in northern Minnesota and in the Upper

Peninsula of Michigan. Since the late 1950s, an additional region has emerged in Florida, particularly around Lake Worth/Lantana and Tampa/St. Petersburg, where Finnish Americans and Finnish Canadians joined Finnish nationals in search of the sun. During the winter, temporary residents transform Lake Worth/Lantana into the largest urban Finnish American community in the country, a curious contemporary recreation of the earlier Finntowns that dotted the Finnish American regions across the nation.

Permanent Finnish Canadian settlements formed three regions—the east, the prairie provinces, and the far west. These communities, largely begun after the Finnish American communities, reflect a different set of variables based on place of origin, time of settlement, and employment options. Furthermore, differences between Canadian and American social and political climates make the Canadian cultural regions even more distinct. Almost two-thirds of Finnish Canadians settled in Ontario. The second-largest group settled in British Columbia. Farming communities in Alberta, Saskatchewan, and Manitoba also developed. In the 1990s, these regions continue to define the Finnish Canadian population.

A rich body of Finnish American lore with regional and individual variants confirms this cultural geography. Part of that lore grows out of the strong Finnish American and Finnish Canadian institutions the immigrants created in their communities—churches, temperance societies, workers' halls, cooperatives, and benefit societies. The arts, particularly community theater, bands, and choirs, flourished at regular local programs and at regional and national festivals. Hall life included dances and sports exhibitions. In the larger communities, such activities attained high standards, often involving professionals hired to organize and direct. Largely literate, Finnish immigrants valued education and the power of the word. The proverb “Suomalainen uskoo sanan voimann” (A Finn believes in the power of the word) encouraged the immigrants to create lending libraries, self-education study groups, and a rich Finnish-language newspaper, serial, and book-publishing life. The *nyrkilehti* (fist newspaper) was a spontaneous creation that occurred in many immigrant enclaves. This handwritten immigrant newspaper circulated among friends and local organizations, providing a colorful honest record of immigrants' lives.

These institutions, even though effectively separating Finnish immigrants from other Americans, helped them adjust and fit into American culture. The Finnish cooperative movement illustrates how this worked. Cooperation was a central value to the Finnish immigrant, illustrated in the many informal cooperative efforts, like the *talkoo työ* (work bee), which built the immigrants' early churches, halls, houses, and outbuildings. The cooperative spirit promoted efforts at communal living, the best known being Kreetta, Michigan, a collective farming community on Drummond Island in Lake Huron, and Sointula (meaning Harmony), the utopian colony (infamous also because stories implied that the colony had practiced free love), offshore from Vancouver Island in British Columbia, 1901–1904. By the end of the 19th century, however, the Finns had begun to create formal Finnish cooperative solutions to consumer issues particularly suited to Finns living in an American culture.

What they created out of these efforts, finally, was the largest working retail cooperative in America: the Central Cooperative Exchange, later renamed the Central Cooperative Wholesale, an organization that united scattered retail and general-merchandise stores across the Upper Midwest. Their initiative also created an enduring

Midwest oil company, the Minnesota-based Mutual Life Insurance Company, and the Workers Credit Union of Fitchburg, Massachusetts. Nonetheless, the cooperatives emphasized Finnish solutions for Finnish immigrants, and non-Finns defined it as clannish behavior, part of the reason for the continuing reputation for clannishness that Finns have with the general American public who know them.

Finnish American cooperatives took different forms: in urban areas, cooperative boarding houses, restaurants, groceries, general merchandise, and apartment buildings; in rural areas, groceries, retail, and general-merchandise stores. Started as buying clubs, they became full-fledged businesses as strikes and other labor conflicts made buying difficult. In farming communities, the “co-op,” as it was called, gave new meaning to the proverb “oma tupa, oma lupa” (Your own cottage, your own freedom). Origin stories for these rural co-ops tell often how the co-op began after the local merchant promised to pay a certain price for timber or farm produce, then reneged one too many times on the agreement. Cooperatives stopped such exploitation and encouraged the immigrants to make communal consumer decisions that created an intimate ethnic environment where even Brooklyn, New York, cooperative apartment buildings came complete with humorous Finnish nicknames (Köngäs 1964.)

In spite of the rich yet separate cultural life, Finnish immigrants never created a united community to speak to the larger North American world. Finns divided into numerous factions, some emphasizing spiritual issues, and others emphasizing politics and economics. Most Finnish immigrants had been members of the Church of Finland (Lutheran), but in the United States the Lutherans split into three branches, as well as smaller groups of Methodists, Pentecostals, Congregationalists, and Unitarians. Similarly, while many immigrants, particularly those who came after 1892, were politically progressive and organized nationally as Socialists in 1906, by 1914 the Wobblies left the Federation to form their own group, the Industrial Workers of the World. After 1917 the Social Democrats split away from those who were joining the Communist Party. Finally, in 1929, the Central Cooperative split away from the Communists. All of this proved once again that “If you have four Finns in a room, you’ll get four separate organizations.”

Stories about these factions usually refer to two general categories—“Church Finns” and “Hall Finns” or, using Finland’s Civil War of 1917–1918 as the source for the categories, “White Finns” and “Red Finns.” Rhetoric aside, all groups participated in some form of the cooperatives, and most were active in unions. When strikes occurred, Finnish halls often served as strike headquarters for all ethnic groups. In this latter context, Finns developed reputations for troublemaking in the community, and non-Finns developed stories that talked about the Finns “brazenly marching down the street carrying a red flag.” This non-Finn lore about the “radical Finns” worked in counterpoint to Finnish America’s own lore about the *sisu* (bravery or stubborn determination) that drove the Finnish workers on against incredible odds.

Finns, the first and largest foreign-language unit in the Socialist Party of America, remained 17 percent of the membership in 1917. In the late 1920s, they accounted for more than 40 percent of the Communist Party. For both their labor activities and these political connections, other Americans racially attacked the Finnish Americans. Although Finns had earlier developed reputations for hard drinking and fighting, that reputation took racist overtones when labor troubles began. Epithets like “Finn-LAND-er” and “dumb Finn” were common, and vigilante attacks occurred. The double racism implicit in

statements that Finns were Mongolian and, therefore, Asian hurt so deeply that one Finnish American group still needed to refute the issue in its 1957 book publication, *Finlandia: The Racial Composition, The Language, and a Brief History of the Finnish People*. All sorts of slurs practiced in Finnish American cultural regions continued well into the 1970s (Jarvenpa 1976).

In the 1990s, Finnish Americans often tell about this racism practiced against Finns, racism that either they experienced or know occurred, and they counter the racist attacks with a repertoire of materials based in ethnic pride. They will speak about the Delaware Colony, a body of lore that incorporates the beliefs that John Morton, one of the original signers of the Declaration of Independence, was, in fact, a Finn, and that the American log cabin begins with Finnish log construction dating back to Delaware. They will speak of the ancient folk epic, the *Kalevala*, and the ancient folk instrument, the *kantele*. They will speak of Finland's modern heroes, of the athlete Paavo Nurmi and the composer Jean Sibelius. They will speak of Finland's honesty—"the only country to pay their war debt"—and of Finland's *sisu*—a small nation fighting the Russians alone in the 1939–1940 Winter War.

In addition to the institutional and politically motivated lore, Finnish Americans developed lore about the immigrant work life. This includes richly detailed stories about Finnish domestics working for wealthy Yankee employers like John Pillsbury, who learned to like *puuro* (Finnish porridge) from his Finnish cook; jokes built around Finnish *mainarit* (miners) who use words like *horiop* (hurry up), *vastu mdre* (what's the matter), and *sanomapits* (son of a bitch); and even tall tales about Finnish loggers like Otto Walta in northern Minnesota (Karni 1967). Large oral collections of such Finnish American lore exist at Wayne State University in Detroit; at the Immigration History Research Center, University of Minnesota; at the Finnish Heritage Center, Suomi College, Hancock, Michigan; at the Minnesota Historical Society, St. Paul, Minnesota; and at the Iron Range Research Center, Chisholm, Minnesota.

Finnish Americans themselves recognized early the need to collect their own oral traditions in a written form. Salamon Ilmonen collected the origin stories of countless local Finnish American individuals, families, and communities across the country and published them in a series of volumes from 1919 to 1939, all in Finnish. Excerpts from some of these, for example in Minnesota, are available in English translations made during the WPA (Works Progress Administration) period of the 1930s and 1940s. In addition to Ilmonen, Viljami Rautanen collected the origin stories of the churches, and Elias Sulkkonen compiled the origin stories of the workers' movement within the Finnish American community. After World War II, members of the aging immigrant generation began to publish their own community and regional histories, some as chapbooks, others as monographs. After the 1970s, second-generation Finnish Americans have been prolific authors of memoirs and family histories. In the 1980s, the Immigration History Research Center at the University of Minnesota became the repository of a largely third- and fourth-generation collective effort, the Minnesota Finnish American Family History Project with histories of more than 100 families. The emphasis throughout these efforts has been to record the collective ethnic culture rather than to promote achievements of the individual because "Oma kehu haisee" (Self-praise smells putrid).

In spite of this rich ethnic lore born in the Finnish American immigrant experience, most folklore fieldwork among Finnish Americans has emphasized survivals of folklore from the old country. Finnish Americans were the exotic people living under the shadow of the enormous Finnish folk collections developed and maintained in Finland. The collections of verbal materials from which Elias Lönnrot created the Finnish national epic, the *Kalevala* (1835), led early collectors of Finnish Americana to look for similar treasure troves among the Finnish Americans. Marjorie Edgar, the semiprofessional folklorist collecting in Minnesota in the 1930s, looked specifically for surviving Finnish folklore items. Likewise, Richard M. Dorson, in the mid-1940s, went looking for *Märchen* (fairy tales) among the Upper Peninsula Finnish Americans. However, Finnish American immigrants largely represented folk groups from western Finland, and the *Kalevala* had been assembled from the collected oral traditions of folk groups in the more remote regions of eastern Finland. In actual fact, Finnish Americans learned about the *Kalevala* more in America, becoming familiar with it because Anglo Americans expressed interest in this aspect of their culture (Wargelin Brown 1986).

Collectors have never stopped turning to the Finns for survival folklore, and they have continually discovered and documented a broad variety of old-country verbal and material-culture traditions embedded in Finnish American life. Dorson, for example, found old-country stories about the *noita* (healer) and the *tietäjä* (seer), as well as jokes and tall tales from western Finland, when he collected in the Upper Peninsula of Michigan in the 1940s (Dorson 1952). Ten years earlier, Marjorie Edgar had collected music, proverbs, and charms, all survivals of Finnish folklore from fieldwork conducted in Minnesota. Throughout the 1950s, 1960s, and 1970s, as the immigrant institutions disappeared, it was the vernacular log construction that people valued and saved (Lockwood 1990:24–31). In the 1980s, folklorists discovered in Minnesota how strong the Finnish tradition of bread making remained, particularly *rieska* (unleavened rye bread) and *pulla* (cardamom-flavored coffee bread). Equally important were the daily ritual of coffee drinking and the habit of entertaining at the *kahvi pöytä* (coffee table) (Kaplan, Hoover, and Moore 1986).

Museums with Finnish American collections attest to the interest in old-country survivals. A number of open-air museums include Finnish Americans' folk buildings. Old World Wisconsin maintains two farmsteads. Embarrass, Minnesota, maintains an entire historic district created from a farming community. The Honka homestead in Arnheim, Michigan, and the Wirtanen farmstead near Duluth, Minnesota, provide examples of small backwoods farmsteads. The National Historic Register identifies similar buildings and living sites throughout the regions of Finnish America. Museum collections of Finnish American material objects, while few, emphasize survival materials as well. The Nordic Heritage Museum in Seattle, Washington, and the Finnish Heritage Center at Suomi College, Hancock, Michigan, have largely undocumented collections. The Cokato, Minnesota, city museum includes a good view of 19th-century Finnish American homestead life. Peoples' created museums throughout Finnish American regions will also display old-country survivals. The Michigan State University Museum has a significant collection, professionally documented, of materials that include both old-country and Finnish American objects.

The one survival that attracts everyone's attention is the sauna, the Finnish steam bath. Already in the earliest nonFinn stories told about the Finns are references to the sauna,

that strange custom brought with the immigrants. It attracted the interest of the average citizen as well as the professional researcher. Looking for survival folkways, the late-20th-century researcher discovers that the sauna remains, in many minds, the primary folkway survival from Finland, practiced by the immigrants and continued by the third, fourth, and even fifth generations. Immigrant homesteaders, legends record, built their sauna before cabins. As traditional believers in natural health care, immigrants used the sauna for massage and cupping (bloodletting done with small animal horns inserted in the back); immigrant women gave birth in the sauna with the assistance of traditional midwives. The sauna kept the immigrants clean and healthy. Finnish men, coming home from the logging camps, would head straight for the sauna to get rid of lice or bedbugs.

Later generations have not continued all of these early practices, but they maintain a strong belief in the healing power of the sauna. If a person is sick, he or she takes a sauna. A Finnish proverb still repeated says “Jos ei sauna ja viina ja terva auta niin se tauti on kuolemaksi” (If a sauna, whiskey, and tar salve don’t make you well, death is imminent). Not only is the sauna good medicine for respiratory and circulatory problems, it can relax stiff muscles, cure aches and pains, and relieve stress. Finnish Americans know how to pronounce the word (SOW-nah) and how to create *löyly* (steam from the hot rocks) and practice the rituals for taking a sauna. The saunas in suburban basements and at the lakeshore attest to the importance that the sauna retains (Lockwood 1978).

Other traditions maintained are less visible to the outsider (and thus less documented by collectors) yet remain markers of the survival of Finnish folkways. Particularly important are berry picking, hunting, trapping, woodworking (carpentry, furniture making, carving), and fiber working (knitting, crocheting, embroidery, lacework, and weaving). Rag-rug weaving and rag rugs used in the home have become a signature piece for Finnish Americans, a practice noticed in an exhibition developed by the Michigan State University Museum in 1990.

Music, too, has been a source of survival folklife. Some have wished the survival had been the ancient Finnish folk instrument, the *kantele*, and the immigrant community did have some *kantele* players. However, the musical instruments of choice for immigrants were fiddles and accordians, and they remain the instruments of those who maintain the traditions (Gallmann 1982; Leary 1988). Some people, like legendary accordionist, Viola Turpeinen, and Art Moilanen, violinist and 1990 National Heritage Fellow, took these forms and adapted them to American audiences (Leary 1988; Lockwood 1990). All of these traditions are enjoying a revival as third- and fourth-generation Finnish Americans have rediscovered the traditional Finnish American musical repertoire and have created musical groups with names like *Koivun Kaiku* (Song of the Birches), a *kantele* group, and *Ameriikan Pojat* (Boys of America), a brass-band ensemble. A few Finnish American choral groups continue from their origins in the immigrant communities, but most Finnish American choral singing, like the bands, has disappeared.

Finnish Americans maintain several Finland-based holidays. On December 6, many communities commemorate Finnish Independence Day, December 6, 1917. During the Christmas season, Christmas parties (*pikku joulu*) occur. *Laskiainen* (a celebration of, and participation in, winter sports activities) is traditionally Shrove Tuesday. The Smithsonian Institution film *At Laskiainen in Palo, Everyone Is a Finn* (1983) reveals something of how Finnish holidays have been adopted by the larger non-Finnish community. Some communities also celebrate Kalevala Day (February 28) programs in

honor of the Finnish epic. Midsummer celebrations, complete with *ikokkoî* (large fire) burning in the night during the parties, are held during the summer.

Separate from survivals, Finnish American folklore created in the United States and collected by professional folklorists begins with Dorson, in the 1940s, who recognized the dialect stories told by both first- and second-generation Finnish Americans (Dorson 1948). This has been a continually fruitful field, even published by Finnish-American folk authors like Hap Puotinen and Jingo Viitala Vachon. (*Tradition Bearers*, a 1987 film by Michael Loukinen, includes a segment on Vachon.) More recently, folklorists like Yvonne Lockwood have examined unique folk traditions created in the United States, such things as the “pasty,” a meat pie eaten by Cornish miners and adopted and adapted by the Finns (Lockwood 1990). Likewise, Marsha Penti has examined a national Finnish American summer festival, FinnFest USA. Beginning from the Finnish American immigrant tradition of large summer festivals, FinnFest USA, held annually, alternates among the various Finnish American regions (Lockwood 1990).

Finnish Americans have created a new culture revolving around the Finnish word *sisu*, a unique characteristic of Finns. While the word is known and used in Finland, the term takes new meaning in the Finnish American community, a badge of honor found on sweatshirts, hats, and coffee mugs. It has become an explanation for the Finnish American’s stoicism, independent spirit, and stubbornness, part of a special ethnic mystique called upon in difficult situations, part of a mantra recited by Finnish Americans: “Sauna, Sisu, and Sibelius,” the three S’s that describe Finnish American culture.

Finally, one completely Finnish American folkloric invention has been St. Urho, an invented Finnish saint reputed to have driven the ubiquitous grasshoppers out of Finland. St. Urho has become the reason for a holiday commemorated in many Finnish American communities. Finnish Americans have managed to get the day declared an official day of commemoration in all fifty states in the nation as well. Not surprisingly, the day is celebrated March 16, the day before St. Patrick’s Day, and has inspired a collection of broad dry-wit poems and songs, a color code of purple and green, and an excuse for greeting cards, parades, and parties. Sources indicate that the origins of the elaborated ethnic joke are in the state of Minnesota. Finnish Americans use it as a day that permits pranks and good times (Lockwood 1987).

One of the early Finnish American factions, were the Laestadians, who continue to maintain a conservative Finnish American lifestyle, based in early Finnish American experiences. Laestadians, who practice a form of Lutheranism based in active use of the Finnish language and circumpolar spiritualism rooted in Sami culture, live separate from, but within, traditional Finnish American cultural regions. As a group, they help validate a separate Finnish cultural life that continues to be practiced in the communities where they live. One faction, known as the *Esikoisuus* (the first born), visibly distinguishes themselves through clothing and hairstyle choices. Most, however, are unique only in that they tend to create a separate community with their own cultural activities.

Among the other smaller Finnish folk groups, little if any collecting has been done from Finland Swedes specifically. Recent efforts to recognize Sami Finns have resulted in the beginning of a new effort to study and collect their heritage. Their quarterly journal, *Baiki*, has become a good source for information. The Karelian Finns, eastern Finland Finns who emigrated from Finland after World War II when Karelia was taken

over by the Russians, have had little scholarly attention given to their traditions. Neither have the Finnish American Indians, largely Chippewa descendants of Finnish American fathers or mothers. Their Finnish American lore relates mostly to stories of interracial relations with their Finnish American relatives and their own personal experiences with such Finnish folklife as saunas.

Fishing (Commercial)

Capturing fish in great quantities for die purpose of trade and profit. Fishing in contemporary North America is highly regulated by state and federal governments and generally categorized as commercial or sports. Sports fishing is perceived as primarily recreational, with the fish becoming both object of play and fellow player, and the consumption of fish caught often being a subordinate concern to play, meditation, or socializing. Comparatively, commercial fishing is viewed as work, with cash ultimately exchanged for the fish. Here fish is a commodity expected to be consumed in a number of ways by distant consumers, not necessarily the commercial fisher.

Where sports fishing may be chiefly an individual pursuit for the purpose of seeking individual and perhaps social pleasures, commercial fishing can be likened to farming, with individuals, but more often small crews of workers, performing a public service. Oppositions of pleasure versus work, quality versus quantity, non-consumption versus consumption, and individual versus common good characterize official and, to a large extent, unofficial conceptualizations of modern fisheries. Confounding these distinctions, however, are the majority of commercial fishers who say they pursue their work mainly for the pleasure and challenge of it, and sports fishers who persistently catch in quantity to exchange fish informally with family, friends, and neighbors.

Increasingly forgotten is subsistence fishing—that pursued in order to survive, whether through the direct consumption of fish or through trade of fish. Now lumped under sports fishing and restricted in commercial fishing to the trade but not the consumption of fish, subsistence fishing historically integrates the two fishing arenas, overcomes many of the definitional oppositions, and implies a total cultural experience, as well as symbolic and socioeconomic systems, in which fishing plays a part.

A simpler, broader definition of commercial fishing based on fishing intensity and trade reflects its connection to subsistence fishing and enhances cross-cultural and cross-fishery comparisons. For folklorists, thus, commercial fishing is best seen as fishing that results in catching more fish than a fisher can use and that, therefore, inspires trade. It covers a wide range of fishing operations, from the sports or tribal fisher who systematically catches a daily limit and exchanges it fresh or preserved with family, friends, and neighbors; to the person who fishes with a commercial license part of the year with or without a crew, perhaps in a small open boat powered by an outboard motor; to people who fish with crews of one to eight year-round in a mid-size diesel-powered boat; to people who fish on big processing ships in large crews of as many as twenty, who sometimes stay at sea for months at a time.

Generally, commercial fishers come from families, neighborhoods, or shoreside communities where experiences and work on, or adjacent to, bodies of water are common. By observation, word of mouth, and experience they learn a wide variety of attitudes, skills, and behaviors related to water and fishing. Practicing keen observational skills, they learn to identify and name the desirable and undesirable species of available fish, and learn personality traits and habits of specific kinds of fish and even of specific individual fish. Commercial fishers acquire knowledge of the fishing grounds, learning to visualize the underwater terrain, learning the names for commonly known underwater features, and memorizing landmarks along shore to use in triangulation to position themselves on the water and their fishing gear under the water. They use the behavior of birds, weather phenomena, and the color and character of water to predict weather changes and movements of fish. They also learn to watch and identify the behavior of

other fishers in order to protect their own fishing spots; determine another fisher's fishing spots, equipment, and related success; and come to the rescue in case of an emergency. Since their watchful, secretive occupational style often appears deceptive, commercial fishers reinforce exoteric stereotypes of themselves as untrustworthy and unlawful.

Dedicated fishing people additionally share a wealth of traditional knowledge regarding the design, construction, maintenance, and manipulation of fishing equipment—from lures and jigs to nets, from skiffs to ships—all carefully calibrated to the locale. Familiar with a basic repertoire of knots for building fishing gear and securing equipment, fishers often associate skill with knots with fisherly competence. Secondly, their knots provide an individual signature for the identification of gear. With well-designed, properly knotted gear, a fisher also learns how to place it most effectively with respect to fish behavior, water and weather conditions, and the capabilities of the fishing boat. Critical to the placement of gear in most fishing operations are communication and coordination with others, learning rhythm, timing, and speed while running boats, handling gear, and removing fish from the gear.

Once fish are caught, fishers handle and process them using a variety of traditional techniques related to type of fish, weather conditions, market demand, and transportation concerns. Back ashore, fishers participate in several marketing networks to sell fish most effectively, gaining access to these networks and learning negotiation skills from others and through experience. People who avidly pursue fish generally consume more fish, more types of fish, and more parts of fish than do those whose experiences with fish are more limited. Accordingly, they practice a greater repertoire of methods for handling, preserving, and preparing fish for home consumption, and they regularly include fish on the menu for social occasions, private and public.

While commercial fishers share a basic repertoire of customs, subsets of other traditions depend on the size of the fishing operation and the extent to which a fisher makes a living from fishing. Typically, the smallest operations are broadly and well-integrated into shoreside communities; practitioners share maritime knowledge that is widespread within the shoreside community; and because they do not venture far offshore they exhibit neither highly exclusive occupational traditions nor strongly proscriptive superstitious behaviors surrounding their work on the water. The larger, more specialized, and more full-time the fishing operation, the more likely it takes place at some distance from home, in an environment perceived to be dangerous or different enough from landbased and near-shore locations that it requires special training, equipment, and support. Practitioners generally belong to specialized occupational communities within a greater maritime community separate from the broader shoreside and land-based society. They pass highly esoteric occupational knowledge among themselves and restrict access to membership. They often adhere to occupational rituals and proscriptive superstitious behaviors, and their entire family acts as a support system for the work pursued. Because of the location of work, specialized routines and schedules, family dynamics and interfamily dependence—all oriented toward the water—intensive, larger-scale commercial fishing can be seen as an occupation that fosters a distinctive subculture. Exoteric stereotypes often flourish in adjacent communities signifying the otherness of this subculture.

Larger fishing operations break down again into two types according to size. The smaller, what some anthropologists call “artisanal” fisheries, are small businesses in

which people make most of their living from fishing; in which family members, neighbors, and friends make up the work force and women, children, and elders are involved in shoreside activities; and in which each fisher practices a diversity of skills, having both the opportunity and the necessity to learn each angle of the business. These fishers perpetuate esoteric stereotypes of the strongly independent, individualistic, self-sufficient, professional fisher, and they actively tell personal experience narratives that express attitudes about work, an addiction to fishing, and views of fisheries bureaucrats, sportsfishers, pleasure boaters, and other commercial fishers.

In the largest ventures, what might be called *corporate* fisheries, job specialization increases, the hierarchy of jobs and management structures are stricter and more complex, crew backgrounds and onshore experiences are more diverse, and the involvement of women, children, and elders is restricted to social, political, and relief organizations that support fishing. Since fishers spend so much time with one another, isolated on board, they tend to create a complete social order in microcosm on the ship, in effect leading two separate lives, one with their family ashore, and the other with their “family” at sea.

Because specialized commercial fishing appears to promote a common occupational pattern regardless of where it occurs, it has been said to transcend ethnicity. Yet within most maritime communities where commercial fishing is pursued, a variety of fisheries and scales of operation coexist based on fish sought, gear used, intensity of fishing effort, and related management structures. Fishery divisions often follow ethnic and family lines, with fishers jockeying for position across and within groups, establishing a hierarchy of fishing operations informed by the status of fish sought and ethnic preferences in equipment, fishing terrain, group dynamics, and fish-handling techniques. While perhaps subordinate to an overall occupational pattern, ethnic and family variations are common, as are conflicts among the various ethnic and family groups. Esoteric stereotypes establish the differentiation in networks and fishing philosophies and styles. Finally, wherever commercial fishers occur, they complement occupational groups that serve them and other water-related and land-based groups. These often conflicting groups form a diversified maritime community, not unlike agrarian counterparts, offering a universe of traditions to examine from myriads of theoretical perspectives.

As fish disdain national boundaries, commercial fishing challenges the bounds of definitional constructs and, like fish to fishers, lures folklorists ever farther and deeper.

Fishing (Sport)

Recreational activity the popularity of which transcends racial, ethnic, social, and economic boundaries. Remarking on the curious allure of angling, folklorist and fisherman Andrew Lang suggested that “the passion, or instinct, being in all senses blind, must no doubt be hereditary. It is full of sorrow and bitterness and hope deferred, and entails the mockery of friends, especially of the fair. But I would as soon lay down a love of books as a love of fishing” (Lang 1891:7).

The assumption that fishing as a pastime affords pleasure to its participants as well as amusement to observers is so deeply entrenched in American folklore that it is necessary to remind oneself that fishing as a traditional sport is by no means a cultural universal, or even a historical constant in the traditions feeding our own. Anglo Saxon documents indicate that fishing in that era was regarded as primarily practical, deep-sea fishing being especially feared; only quite late in the Middle Ages does one find accounts such as that of the 15th-century prioress of the convent at Sopwell, Dame Juliana Berners, *On Fysshynge wyth an Angle* (1496), in which practical advice is mingled with commentary on the spiritual value of fishing as an aid to relaxation, concentration, and virtuous contemplation—values associated with fishing that recur throughout the British and Anglo American literature on fishing from Izaak Walton to the latest issue of *Field and Stream*. African American folklore is rich in the lore of fishing for pleasure as well, but it is more difficult to trace the roots of these in African tradition.

Despite the abundance of written and other media publications at all levels of sophistication concerning fishing, it is an activity learned initially almost invariably by example and direct tutelage, ensuring that the body of knowledge held by any one angler will have a strong and often conservative traditional component. The activity offers a curious combination of characteristics from the standpoint of cultural analysis: Although often pursued in solitude and intrinsically personal and isolated in nature, it contains several elements of performance. At the most primary level, the angler presents a deceptive performance for the fish that, if convincing enough, results in a catch. At the secondary level, the angler presents himself or herself to others using an array of expressive forms that define him or her as a member of one or several subgroups of anglers, and that account for triumphs or explain away defeats.

Although fishing for pleasure in the United States is not limited to a particular class or group of individuals and all generalizations are dangerous, it is possible to speak of types of American anglers in terms of certain “folk taxonomies.” Fly fishermen, for example, are understood to pursue a technique considered rarefied and a bit arcane, with an elaborate esoteric vocabulary, garb, and history all of its own. Its roots are deep in the aristocratic British angling tradition, although the demands of American stream terrain and species have brought about some characteristic innovations in custom and practice. At the other end of the continuum is the image of the bait fisherman—the barefoot kid with a cane pole (now more likely graphite) and a can of worms wending his simple way to the local fishin’ hole, innocently delighted to bring home a mess of obliging bluegill.

The powerful American tendency toward organization and competition can be observed in the rather recent phenomenon of groups of bass fishermen engaged in day-long fishing tournaments, vying for substantial cash prizes. One group of anglers large in number but neglected in traditional images of fishing in America is that of women—despite the example of Dame Juliana, their status remains marginalized and their stereotype remains tainted by the imputation of incompetence or dumb luck.

American fishing folklore offers folk taxonomies of fish as well as fishermen. Unlike the British tradition's relatively consistent distinction between "rough" fish and "game" fish, American categories are as diverse as the American communities of fishermen. Folk nomenclature reflects this diversity: *Pomoxis annularis* and *nigromaculatus*, for example, known most commonly as white and black crappie, go by at least fifty other regional and local names, including goggle-eye, papermouth, banklick, lamplighter, Dolly Varden, and sac-a-lait. From the fierce, elusive muskellunge and the glamorous trout, to lowly bottomfeeders such as carp and catfish, each variety of fish is characterized according to appetite, temperament, appearance, and savor by the communities of anglers who seek or reject them.

Customary folklore concerning fishing is extensive, providing some support for the theory that ritual and belief practices are especially strong where an activity's outcome is uncertain. It is by far the aspect of sport fishing most thoroughly documented by folklorists. Portents of good and poor fishing days involving observation of the weather, animal behavior, and lunar cycles are common: The latter can be found in any contemporary almanac or popular fishing magazine. Luck is attributed to the presence or absence of numerous factors, the variables of which encompass virtually every aspect of the fisherman's circumstances and behavior except those controlled by skill, experience, and observation.

Fishing folklore is by no means limited to the practice itself: Verbal lore concerning fabulous catches represents a whole category of exaggerated narrative, highly formulaic and entertaining in content, with skeptical reaction from the audience an expected part of the performance. Perhaps in response to this automatic skepticism, many fishermen nowadays document their more impressive catches by photographs in which the poses and composition are consistent in pattern—a practice that has largely taken the place of the older, more expensive tradition of taxidermy.

Flanders, Helen Hartness (1890–1972)

Foremost collector and editor of Vermont folk-music traditions and founder of the Helen Hartness Flanders Folk Music Collection at Middlebury College. A conscientious, enterprising, and intelligent woman, Flanders undertook her collecting in May 1930 for the Vermont Commission on Country Life, which had the 150th anniversary of Vermont's statehood (1941) in mind. The avocation of a lifetime began as an exercise to record Vermont heritage for the benefit of all Vermonters. The wife of Ralph Edward Flanders, a wealthy businessman who served Vermont in the U.S. Senate, she began documenting old songs and melodies in the living memory of Vermont descendents of early settlers, gaining an understanding of folk tradition in the process. Between May and December 1930, she recorded a small, yet impressive, body of early New England songs and music, including rare ballad texts with their tunes. Of that first season, Flanders said, "before undertaking Prof. Peach's challenge, I had never even heard a traditional song." That she found immediate satisfaction in fieldwork is evident from her assessment of that effort: "Desire in this quest mounts readily to passion. The fascination of this lore continues; its excitement is cumulative."

Flanders ventured upon the ballad-hunting scene at a most fortuitous time. American ballad scholars and collectors had broken new ground over the preceding quarter-century; had figured out an appropriate categorization, definition, and catalog of American ballads; and had fostered great interest among a small but dedicated band of ballad enthusiasts. New England had just attained its due as a repository of migratory ballads, and, although the active tradition was fast declining, tradition bearers were numerous enough to impart a respectable, even enviable, repertoire of Old World and New World pieces. Music annotation and analysis had become an important component of folksong fieldwork, and Phillips Barry had demonstrated the importance of the informant and the setting in documenting folk tradition.

In the tight circle of New England balladry, Flanders soon crossed paths with Barry. She benefited greatly from his mentoring, improving the scope of her fieldwork, applying appropriate archiving principles to her data, and getting to know everyone of importance in folk-music studies. She placed articles in newspapers (those of Springfield, Massachusetts, and Narragansett, Rhode Island, for example), greatly increasing her list of informants and correspondents. In 1939 she invited Alan Lomax of the Library of Congress for a week of recording her informants for the library and for her Archive of Vermont Folk Music, then at Smiley Manse, her home in Springfield, Vermont.

As her material came to the attention of ballad scholars, Flanders received many inquiries about specific items, enough to know that her collection had value within academe. This fact was a motivating force behind moving her archive to Middlebury College. (The college also boasted a ballad specialist on its faculty and a ballad course in its curriculum.) In February 1941, she established the Helen Hartness Flanders Collection there, containing New England folksongs, ballads, and folk tunes collected by her or under her direction. Disk records, dictaphone cylinders, typescripts of each recording, and items sent by her correspondents numbered about 2,000 items. A dozen years later, the collection accommodated close to 10,000 items. Flanders had large aspirations for the archive. She envisioned Middlebury students learning to sing (thereby, she naively

assumed, perpetuating the tradition), then returning to their home regions to collect like materials. The college indicated its intention of integrating the archive not only in literature courses, but also in history, music, and even the social sciences.

Flanders took delight in introducing informants to the public. In July 1940, she invited Lena Bourne Fish of Jaffrey, New Hampshire, to Middlebury's Bread Loaf College to present her songs to an audience of students, faculty, and townspeople. In February 1948, she delivered the Louis Charles Elson Memorial Lecture at the Library of Congress, where she presented Elmer George and Asa Davis of Vermont and Charles Finnemore of Maine to sing some of the ballads they had recorded for her.

Flanders began publishing out of her collection for local readers very early on, producing, in 1931, *Vermont FolkSongs and Ballads*, with music transcriptions by George Brown, a cellist from Melrose, Massachusetts. With Barry's professionalism as a guide, she produced *The New Green Mountain Songster* (1939), the first scholarly treatment of items from her collection. George Brown again supplied musical transcriptions, and her daughter, Elizabeth Flanders Ballard, took an active role. The volume was a success, reaching both a popular and a scholarly audience. Barry's introduction and annotations contributed a high order of scholarship, and the inclusion of short pieces, play parties, and dance materials found resonance in the lives of her rural New England readers.

Flanders hired musicologist Marguerite Olney to be her assistant, and they collaborated on the highly readable miscellany *Ballads Migrant in New England* (1953), which included an Introduction by Robert Frost. Olney became the first archivist of the Flanders Collection at Middlebury and annotated the long-playing recording *Eight Traditional BritishAmerican Ballads from the Helen Hartness Flanders Collection of Balladry and Folk Music* (1953).

Through her association and collaboration with professional ballad scholars, Flanders brought a depth to her fieldwork and related activities she could not have achieved on her own. She was admirably open to the guidance of veteran fieldworkers while never abandoning the original impulse of her efforts—to preserve Vermont's heritage for the benefit of all Vermonter. After Barry's death in 1937, Tristram Potter Coffin, a young scholar who had expressed an early admiration for Flanders' ballad collection, worked closely with her. Together they produced four scholarly volumes of Child ballads. Coffin wrote the headnotes, and Bruno Nettl provided musical transcriptions and notations.

Working in an era when a spirit of competition dogged the field, Flanders succumbed to a bit of bean counting. She was tweaked occasionally about including examples of spurious folk origins to inflate the breadth of her collection, especially in the area of the treasured Child ballads. While there is some evidence for this, the proportion of suspect items is minuscule. Flanders was influenced, one assumes, by the entrenched bias of the academic ballad scholars, even as the field was trying to move beyond the ballad-aristocracy mindset. This was an abiding problem for the amateur collector, who was often far more successful in garnering tradition than were the scholars but whose understanding of the tradition was usually rather shallow. To her credit, Flanders vaulted this gap by gaining the respect and collaboration of scholars among the most eminent of the time. Helen Hartness Flanders reached for the highest standards and achieved them.

Folk Ideas

Culturally held beliefs that are constituent parts of the larger worldview of a culture. (Worldview refers to the total manner in which the members of a culture see the nature of the universe and their place in it.) The term was coined in 1972 by Alan Dundes and has not been widely used by other folklorists.

Dundes proposed the term because he thought that worldview was such a broad concept that students of culture needed a way to refer to smaller “units” of it. He also hoped that “folk ideas” would replace the misuse of the term “myth” (which, to folklorists and anthropologists, means a type of narrative) to refer to the grand, controlling ideas of a culture (as in the “myth of the frontier”), a usage adopted by literary critics and others. The term “folk ideas” was not meant to refer to a specific genre of folklore but rather to concepts that might be embedded in various kinds of folklore or even in other, nonfolkloric cultural expressions, including literature and the mass media.

Dundes suggested that folk ideas included such “cultural axioms” as the American notion of unlimited good (there is no limit on the amount of something that can be produced or obtained) and the American belief that all persons have equal opportunity. The idea of unlimited good might be expressed, for example, in the folk expression, “There’s plenty more where that came from.” A culture may have contradictory folk ideas.

Folk ideas are related to folk stereotypes (such as those about ethnic groups), but Dundes saw the former as less consciously conceived than the latter.

Folk Museums

Museums displaying artifacts of traditional life, often in a park-like, rural, or “village” setting. The origin of the folk museum has been generally credited to museums established in Scandinavia in the late 19th century. Artur Hazelius’ idea of the folk museum led to what is known today as the Nordiska Museet and Skansen (meaning open-air museum) in Stockholm. In his earliest museum exhibit work at the 1878 World’s Fair in Paris, Hazelius is said to have “arranged his exhibits as stage sets with one side open facing the public, the figures arranged in highly emotional tableaux similar to the way it is done at a waxworks.” Bernard Olsen, founder of the Danish Folk Museum, found Hazelius’ method of exhibition unsatisfactory when he saw it at the Worlds Fair in Paris in 1878. He preferred the approach that the Dutch had employed, a complete room that one could walk into and where “each single thing came from old houses and stood in its accustomed position.” Olsen later recalled: “In contrast to the Swedish manner the effect was stirring, and from the moment I entered the room, it was as if one were in another world—far away in time and space from the crowded, modern exhibition. It was clear to me this is how a folk museum should be.”

These early reflections on the proper approach and organization of the folk museum were shaped also by the national Romanticism of northern Europe. Later, in 1891, Skansen, the first open-air museum, was founded in Stockholm, where old farmsteads and community buildings from Sweden and Scandinavia were saved, moved, and then reerected. Both the Nordiska Museet and Skansen provided the impetus for other nations and smaller community efforts in the development of folk museums.

These early folk museums fostered the concept of the open-air or outdoor museum and the spread of ethnological research in Great Britain and then to Canada and the United States. Folklife museums in the late 20th century explore a variety of approaches to the investigation and understanding of human social organization and stress the holistic nature of a traditional culture on all levels of society.

The concept of the open-air museum was utilized as a model for American museums such as the Farmer s Museum in Cooperstown, New York; Colonial Williamsburg, Virginia; Old Sturbridge Village, Massachusetts; and the Henry Ford Museum, Dearborn, Michigan. In Europe the influence of the Skansen model led to the growth of additional open-air museums on into the 20th century. Among the major museums were the Welsh Folk Museum, St. Fagans, Wales; Osterreichische Freilichtmuseum, Stubing, Austria; and SchleswigHolsteinisches Freilichtmuseum, Kiel, Germany. The growth of these open-air museums encouraged the development of smaller complexes across Europe, the United States, and Canada.

The open-air museum as a folk museum was designed to provide a focal point for the study, collection, and interpretation of national, regional, and local culture. The emphasis has been primarily on the assembly of buildings in a new interpretive setting where the cultural life of a particular place in time is re-created. Over the years, museum staffs have enhanced the presentation of the cultural life of the nation, region, or locale by

involving traditional artists and performers, tradition bearers, and interpreters, as well as re-creating the patterns of daily life by utilizing animals, plants, gardens, and features of the natural world to re-create a more natural context.

The idea of the folk museum has evolved to be a conceptual approach to various specific cultural traditions. The folkmuseum movement has been spurred by the scholarly desire to depict the history and lifeways of average families, typical communities, and everyday life. The result has been the creation of living history farms, museums linked to occupational traditions—such as those of miners, textile workers, or ironworkers—urban museums featuring tenement-house life or immigrant communities, and museums that serve to present local ethnic and cultural traditions.

Folklife as a discipline has contributed substantially to the development of these new community-based museums. With the goal of re-creating a living museum experience where the visitor encounters authentic contexts for learning, folklorists have played critical roles in re-creating everyday life and the historical processes that make a particular culture. The use of oral-history fieldwork, the involvement of informants as presenters, and the attention to the complexity of communitybased culture are critical elements in providing an effective and accurate learning environment.

An extension of the folk museum has been the emergence of the folk festival as a short-term living museum. The Smithsonian Institution's annual Festival of American Folklife in Washington, DC, has established a model in which folk arts, occupational traditions, and regional culture are presented with exhibit-like sets to evoke the original context. Professional ethnomusicologists, folklorists, and other cultural specialists are engaged as researchers and presenters to enhance the educational presentations. This approach has been adapted by other museums and cultural organizations in the creation of state and local folklife festivals.

In the later 20th century, folklife exhibits (continuing and temporary) and folklife collections have been developed by many art museums, history museums, and natural cultural history museums. Early open-air museums such as Colonial Williamsburg and Old Sturbridge Village have been followed by, among others, the Museum of International Folk Art in Santa Fe, New Mexico; the Museum of American Folk Art in New York City; and the Museum of Civilization in Ottawa, Canada—as well as museums devoted to specific cultural groups—all featuring folk traditions and emphasizing the folk process as well as the products of folk culture.

Folklife-museum interpretation has made a substantial contribution to museum interpretive theory as it is practiced today. The contextual approach to folklife stresses the expressive behaviors of tradition bearers. This approach has influenced the interpretive educational approach of history museums, leading to more hands-on activities, special demonstrations, and a wide array of museum-sponsored festivals and creative restagings of special cultural events and activities.

The growth of folk museums has been truly extraordinary over the past century. The Association of European Open Air Museums produces a guide to more than 350 open-air museums in twenty-one European countries. Communitybased folk museums are also being established at a rapid rate. Legislation such as the federal Native American Grave Protection and Repatriation Act has led to an explosion of tribal museums in the United States. Meanwhile, major history, natural history, and art museums are recognizing folk arts as valued materials to collect and present. This development has enabled museums to

achieve more representative collections of their communities and thus attract broader audiences. The folk museum movement continues to thrive as the basis of independent freestanding museums as well as a scholarly force that has shaped museology in Europe, North America, and now in other parts of the world.

Folk Schools

The English translation (sometimes “folk college”) of the Danish words *Folkehojskole* or *Hojskole*. In their various uses, the terms carry social, philosophical, educational, and political meanings, with certain paradigmatic relationships to the applied folkloristics of the mid- and later 20th century.

The folk-school movement was envisioned and inspired by Nikolaj Frederik Severin Grundtvig (1783–1872). Grundtvig was a theologian who loved Danish history and people and harbored a deep concern that everyone have access to education. In the years following 1830, this goal became an immediate necessity as the result of political change. South of the Danish border, a new German state was emerging, and it became Grundtvig’s desire that Danes reawaken to spirituality and strength of the individual self while promoting strength in national character. In publications of the early and mid-19th century, Grundtvig wrote passionately regarding the need for the *Folkehojskole*. A new movement was also beginning to spread throughout Denmark replacing Rationalism with Romantic nationalism. These shifts in worldview changed the dominant school of thought in the literary, visual, and performing arts. Coinciding with these movements was one that advocated that people take the spiritual concerns and matters of the church into the people’s own hands, much the same as the “Great Awakening” religious movement functioned in the United States during the 18th century. Grundtvig, influenced by all of these intellectual currents, was an advocate for the children of rural farm families, whom he wished to see acquire technical skills in a noncompetitive environment, while having their physical and spiritual needs enhanced. Thus, the *Folkehojskole* was viewed as an informal institution that would enrich the body, mind, and spirit while fostering independent thinking by enlightened, courageous, and conscientious citizens.

The first Danish *Folkehojskole* was founded in south Jutland on November 7, 1844, and was called *Rodding Hojskole*. By 1870 a total of fifty-two such schools had been founded, and by the late 20th century hundreds had been founded throughout Denmark, many of which are still in existence.

In England in the late 19th century a related movement to found “settlement schools” emerged. The settlement-school idea arose from desires, articulated by prominent persons of the time, to improve the lives of the poor (Charles Dickens, 1812–1870), to eliminate inhumane working conditions in factories (Robert Owen, 1771–1858), and to create a more even distribution of wealth (John Stuart Mill, 1806–1873). In 1884 Toynbee Hall was established as a settlement school in east London. This school has been characterized by Allen Davis as “the culmination of a diverse reform movement, closely allied with Romanticism, that sought to preserve humanistic and spiritual values in a world dominated by materialism and urban industrialism,” all concepts that were dear to the thinking of Grundtvig as well.

During the late 19th century in the United States, a generation of people, many of them women, left formal educational institutions in the Northeast after completing their educations and emigrated into regions of the Appalachians to perform “cultural work”

among the indigenous people. Part of this work included the establishment of cottage industries in the arts and functional crafts, and this practice helped usher in an arts-and-crafts revival in Appalachia, the impact of which is still felt in mountain communities.

The concept of the folk school in the United States, drew from the forces of the craft revival in Appalachia, the settlement-school concept in Britain, and the Danish *Folkehojskole*. During the early 20th century, New England native Olive Dame Campbell began to travel in the Appalachian Mountains with her husband, John C. Campbell, who was working on a social survey of Appalachian life for the Russell Sage Foundation. During her travels in which she implemented some of the first and most scientific ballad collecting in Appalachia, she formulated the desire to found such a school in the region. With folksong and folk-dance collector Cecil Sharp of England, she collaborated on *English Folk Songs from the Southern Appalachians* (1917). She was also a founding member of the Southern Highland Handicraft Guild, and thus instrumental in the revival of folk craft in Appalachia.

In 1925, after traveling and studying the folk high schools in Denmark, Olive Campbell and Margaret Butler of the Hindman Settlement School in Kentucky founded the John C. Campbell Folk School in Brasstown, North Carolina. Until her retirement in the mid-20th century, Campbell codirected the school and taught her students concepts of enlightenment for the body, soul, and spirit through nature studies, the construction of folk art and functional craft with an emphasis upon *process over product*, and the awakening of the inner self through music and dance in a spirit of noncompetitive interaction among a diverse cross-section of the populace.

As the 21st century approaches, the John C. Campbell Folk School serves more than 3,000 students per year. More than an educational institution, the school also maintains an archive and a collection of art and craft objects, presents weekly concerts that celebrate the musical traditions of the community and region, sponsors community dances that focus on local and regional dance styles, and maintains an ongoing folklore program, which documents and makes visible the intrinsic folklife of the region through a wide variety of publications and public programs.

During the 20th century, other such folk schools were established, but their emphasis has shifted as cultural, educational, and spiritual concerns have changed. The Highlander Folk School of Tennessee, for instance, became a training ground for social protest and civil disobedience during the late 1950s and 1960s. It was at the Highlander Folk School that Sister Rosa Parks and Dr. Martin Luther King Jr. were trained. In the mid-1990s, the Highlander Folk School is involved in environmental studies and related applied protest activities regarding environmental waste and pollution. The Hindman Settlement School of Kentucky, founded on the English settlement-school model and closely related to the folk-school movement, has evolved into an educational institution specializing in dyslexia-related reading disorders among children and young adults.

Thus, the humanitarian concepts and aspirations toward holistic education continues with a very few folk schools still in operation in the United States; of them, the John C. Campbell Folk School is the longest in continuous operation upholding the original strivings of the Danish *Folkehojskole*.

Folk Speech

Vernacular pronunciations, grammatical forms, and expressions associated with rustic or old-fashioned members of a culture. Folk *speech*, like folk *lore*, is transmitted from one generation to another within oral traditions of a culture rather than through public communications media or educational or institutional precept. It is associated primarily with the working class in both agrarian and industrial settings, particularly when spoken with a strong regional accent. Folk speech may be used by anyone, but it is most commonly associated with individuals who are past middle age, who have relatively little formal education, or whose income is well below the national average. Because folk speech persists through many generations, it contains many archaisms and is often used in folk sayings.

Many of the pronunciations, words, grammatical forms, and syntactic structures that are regarded as folk speech originated in earlier stages of a language and have been retained in some or many dialects for centuries. For instance, double or triple negatives and the use of *ain't* (*He ain't never done nuthin like that before*) derive from the use of augmented negation in Old and Middle English and the contraction of *are not/am not* and *have not/has not* (with later loss of *h* and weakly articulated *v* and *s*) in Early Modern English. Folk usages may also develop from nonhistorical forms of untraceable origin, such as *He ain't do that* ("He didn't do that") in African American Vernacular English. Some folk speech is found in all dialects of a language, such as double negatives and *ain't*, whereas other folk usages are specific to certain regions, such as the use of *y'all* in the American South. Folk forms may develop in English as a second language and be retained after acculturation, as in the German and Polish American use of *ainna/ enna* (from *ain't it*) as a tag question (*Hot today, ainna?*) used by residents of Milwaukee and South St. Louis. Occasional folk usages can be traced through millennia, such as the Chicano Spanish verb form *semos* for standard *somos* (we are), traceable to variant usage in Rome when Augustus Caesar used *simus* rather than *sumus*.

In the United States, the regions that were settled by native speakers of English before 1800—New England, the Southeast, Appalachia—are known for their folk speech, such as "Down East" language in Maine or "hillbilly" talk in Tennessee and northern Georgia. The Upland South, the Mississippi Delta, and the Ozark Mountains were settled by immigrants from lowland and upland areas of the Southeast and thus use folk speech forms derived from the language of their linguistic ancestors in the South Atlantic states. The Midwest and the West attracted a greater variety of immigrants and consequently a mixing of cultural and linguistic traditions; also, public education was widely available within two generations after these areas were settled, thereby widening the influence of "book language" on local speech. Thus, the expression "folk speech of Kansas" would have a much narrower range of reference than "folk speech of Maine" or "folk speech of Alabama."

The folk language of African Americans in the South developed through oral culture, not just during the time of slavery but well into the 20th century. Because of limited

educational and economic opportunities prior to the last quarter of the 20th century, African Americans not only have had less access to “book language,” but also have lived in social environments that contribute to the development of vernacular speech that is substantially different from the language of Americans who have economic, social, and political power. During Southern migrations to urban areas in the first half of the 20th century, folk speech forms in Black English vernacular spread across America (such as the uninflected *be* in *He always be tellin me somethin new*). Because Black folk speech originated in Southern states, the expression “folk speech of African Americans in California” would be relatively meaningless, whereas “folk speech of African Americans in the Mississippi Delta” is very meaningful.

Nonstandard verb forms are particularly salient in folk speech. In interviews for the *Linguistic Atlas of the United States and Canada* (see Editor’s Note) in New England, the Upper Midwest, the Atlantic states, and the Gulf states, a substantial number of Americans said *he don’t* rather than *he doesn’t*, particularly older speakers with less than a high school education. Similar results were found by fieldworkers for the *Dictionary of American Regional English* (Cassidy et al. 1985-; henceforth *DARE*). Most of the nonstandard verb forms that are regarded as folk speech derive directly or indirectly from regularization processes that were well under way in Early Middle English (ca. 1250). In Old and Middle English, the suffixes of past-tense verbs and past participles were weak (added a suffix with *d* or *t*: *talk/talked*, *say/said*, *buy/bought*) or strong (changed the root vowel but did not add *d* or *t*: *know/knew/known*, *find/found/found*). Virtually all new verbs that have entered the language since Late Middle English use the regular weak inflections (add *d* or *ed*), and many of the older verbs have changed their form (*boughten*→ *bought*). Present-day folk use of *knowed* and *growed* reflects the tendency for Early Modern English speakers to use the new form of suffixation, whereas *holp* and *clomb* reflect retention of an old form. Past-tense verbs like *he writ* and *he drunk* derive from strong verbs that used different root vowels in singular and plural forms (*he wroot/thei writ*; *he drank/thei drunk*); in the 18th and 19th centuries, authors of dictionaries and school grammars favored one of the competing forms but the “folk” often continued to use other form. Folk usages such as *hit* (it), *betwixt*, *three foot high/go three mile down the road*, and many pronunciations (for example, *sech* for *such*) also have historical explanations.

Folk usages do not necessarily derive from Middle English (1100–1500) or Early Modern English (1500–1700) grammatical forms. The present-day use of past-tense forms as past participles (*it was wrote that way*; *he should have went home*) developed in Modern English after the loss of distinction between past-tense and past-participle forms. Though these verbs are considered “wrong” by educators, they persist in oral contexts and thus are part of folk speech. The past-tense forms *dove* and *snuck*, following the older vowel-change forms of the past tense, apparently developed during the 19th century (*Webster’s Dictionary of English Usage*). In the late 20th century, writers tend to use *snuck* only for humorous effect or to suggest rural or unsophisticated speech, but both *dived* and *dove* are used widely in print. The competing past-tense forms of *dive* have regional distributions, with *dove* predominant in Atlas data from Northern states and *dived* predominant in data from Southern states. The distribution of *div* in Atlas surveys was similar to that of other archaic forms (thus folk speech)—namely, in northeastern New England and the Upper South and in the speech of African Americans.

Pronoun forms play a prominent role in folk speech. Throughout medieval and Renaissance Europe, the second-person-plural pronouns *vous* (French), *Sie* (German), and *ye/you* (Late Middle English) were used for singular reference in formal social contexts, and the singular forms *tu*, *du*, *thou/thee* were reserved for informal contexts. After *you* had become established as a singular form in Early Modern English, *you all* and *you ones* developed as folk plural forms. Over time, these forms were contracted to *y'all* and *youens*. Folk forms also developed in the possessive pronouns in Late Middle English as *my/mine* and *thy/thine* developed from Middle English *min* and *thin*. The *n* was elided when these words were modifiers of nouns beginning with consonants, and the longer forms were used in modifiers before vowels and in the pronoun form (*mine eyes*, *they are mine*). In Southern and Midland dialects in 14th-century England, the *n* came to be associated with the pronoun form and was added to other possessive pronoun forms (*your eyes*, *they are yourn*; *his eyes*, *they are hisn*). In Northern and East Midland dialects in 14th-century England, *s*, by analogy to noun forms, was often used to mark the possessive pronoun (*your eyes*, *they are yours*; *her eyes*, *they are hers*) (Mossé 1952:59–60). In Old and Middle English, none of these possessive pronouns had ever used *s*. The East Midland form, which would have been used in the London area, became the preferred form in printed documents. In interviews for *The Linguistic Atlas of the Gulf States* in the 1970s, *yourn* was used twenty-three times and *hisn* forty-two times. In vernacular Black English, *s* is often added to the pronoun *mine* in emphatic usage, particularly by young speakers (*What's mines is mines!*).

Loan transfers and borrowings in the speech of immigrant groups have become part of American folk speech, such as *schlep* and *Are you coming with?* from Yiddish influence. Elements of foreign accent often remain in speech well after acculturation, such as *dese tings* in urban Italian American settings in the East; *dis* and *dat* in the speech of Midwesterners of German ancestry; and the Scandinavian American pronunciation *rench* for *range* in the Iron Range of Minnesota. These usages are usually regarded as *ethnic dialect*; they are passed from one generation to another by processes that keep other elements of folk culture alive.

During the 1960s and 1970s, when national attention was focused on the education of children from impoverished homes, linguists used the term *social dialect* to refer to the language of socioeconomic and ethnic groups in America. Social dialects include not only the “nonstandard” language of minorities (Hispanics, Blacks) and poor Whites, but also language typically used by speakers of higher social status in certain contexts, such as the language of sales personnel in elegant shops catering to the rich. In this sense, Standard English is the dialect that educated people use in semiformal and formal social contexts.

Authors often use folk speech to indicate that a character is uneducated, rustic, or old-fashioned. Generally, an author uses only a few folk-dialect items, just enough to evoke the intended impression. Writers often spell words to give the impression of folk pronunciations, such as *duz*, *sez*, *wuz*, and *wimmin*. These spellings are known as *eye dialect*. In most standard varieties of English, *does*, *says*, and *women* are pronounced *duz*, *sez*, and *wimmin*, and in rapid speech *was* is pronounced *wuz* under weakened stress. Even though these spellings accurately represent standard as well as folk pronunciations, the “misspellings” give the impression of rusticity or low level of education.

Though slang and argots are transmitted through oral traditions, they are not folk speech because their use is limited to groups with specialized interests or to generations younger than middle age. Slang terms tend to be shortlived: What was *neat* in the 1950s became *cool* in the 1960s, *rad* in the 1980s, and *fly* in the 1990s. Such terms are used primarily by younger speakers and experience short lives, but *pot*, *dope*, and *crack* as terms for illegal drugs have become candidates for standard usage in public discussions of drugs in print and electronic media. If these latter terms continue to be used for several generations after other terms have replaced them, they, too, may be considered folk speech at some time in the future.

Though folk speech is generally associated with nonstandard usage, such as the examples used so far, much of our everyday language derives from oral traditions and, in this sense, is folk speech. For example, *soda*, *pop*, *tonic*, and *dope* are used in conversation to refer to carbonated soft drinks. *Tonic* occurs primarily in New England and *dope* in the Southeast, whereas the other two terms are used throughout the country, though with some regional distribution (*pop* in Kansas City and *soda* in St. Louis). In formal written contexts, *soft drinkis* preferred because the conversational terms are considered informal. Young people may introduce terms that later will be regarded as folk speech. For instance, most of the informants in the *Atlas* and *DARE* surveys had regional variants for *dragon fly* (such as *snake doctor*, *snake feeder*, *darning needle*), and interviews during the 1960s and 1970s found that young speakers had added *helicopter bug*. Some everyday terms have regional distributions that are rarely noted by anyone except dialectologists. For example, in *DARE* interviews, *armful* is common in Northern and Eastern states whereas *armload* is more common in Southwestern and Western states.

Though many competing grammatical forms and all conversational vocabulary ultimately derive from oral traditions, some are sanctioned by usage mavens, and others are not; whether a particular form would be considered folk speech depends on who is “passing judgment,” who uses the form, and the circumstances under which it is used. In a school setting, *He knowed just where it was—three mile down the road*, would be considered “incorrect,” and perhaps quaint, but the same sentence spoken by the pupil’s grandfather would be considered folk speech. *I seen him*, spoken by an elegantly dressed office worker would be considered “uneducated,” but the same phrase in the speech of a laborer digging a ditch for a sewer pipe would be considered working-class folk speech. English professors who use the phrase in any social context would be committing a gaffe, but animal husbandry professors who use it in conversations with pig farmers might be merely using the folk speech of those with whom they communicate in their profession.

Public Law 94-201
94th Congress, H. R. 6673
January 2, 1976

An Act

To provide for the establishment of an American Folklife Center in the Library of Congress, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That this Act may be cited as the "American Folklife Preservation Act".

DECLARATION OF FINDINGS AND PURPOSE

SEC. 2. (a) The Congress hereby finds and declares—

(1) that the diversity inherent in American folklife has contributed greatly to the cultural richness of the Nation and has fostered a sense of individuality and identity among the American people;

(2) that the history of the United States effectively demonstrates that building a strong nation does not require the sacrifice of cultural differences;

(3) that American folklife has a fundamental influence on the desires, beliefs, values, and character of the American people;

(4) that it is appropriate and necessary for the Federal Government to support research and scholarship in American folklife in order to contribute to an understanding of the complex problems of the basic desires, beliefs, and values of the American people in both rural and urban areas;

(5) that the encouragement and support of American folklife, while primarily a matter for private and local initiative, is also an appropriate matter of concern to the Federal Government; and

(6) that it is in the interest of the general welfare of the Nation to preserve, support, revitalize, and disseminate American folklife traditions and arts.

(b) It is therefore the purpose of this Act to establish in the Library of Congress an American Folklife Center to preserve and present American folklife.

DEFINITIONS

SEC. 3. As used in this Act—

(1) the term "American folklife" means the traditional expressive culture shared within the various groups in the United States: familial, ethnic, occupational, religious, regional; expressive culture includes a wide range of creative and symbolic forms such as custom, belief, technical skill, language, literature, art, architecture, music, play, dance, drama, ritual, pageantry, handicraft; these expressions are mainly learned orally, by imitation, or in performance, and are generally maintained without benefit of formal instruction or institutional direction;

(2) the term "Board" means the Board of Trustees of the Center;

(3) the term "Center" means the American Folklife Center established under this Act;

Folklife Movement

Scholarly approach beginning in the 19th century emphasizing the “folk cultural” or holistic study of everyday practices, artifacts, and expressions in community context. The roots of the movement date to the use of the Swedish word *folkliv* (folklife) in 1847, when it appeared in a Swedish book, *Folklivet i Skytts harad* (The Folklife of the Jurisdictional District of Skytt). By 1878 it was used in the title of a new periodical, *Svenska Landsmal och Svenskt Folkliv* (Swedish Dialects and Swedish Folklife). The German equivalents of folklife were *Volksleben* and *Volkskunde*, which regularly appeared after 1806. *Volkskunde* was variously defined, but a significant meaning for it emerged emphasizing everyday life and tradition of individuals and communities in ethnic-regional contexts. Richard Weiss defined *Volkskunde* in 1946 as “the study of the interrelationships between the folk and folk-culture, in so far as they are determined by community and tradition” (Weiss 1946:11). Influenced by German and Swedish models of folklife research, Don Yoder proposed that folklife study in American scholarship “is oriented toward holistic studies of culture regionally delimited and toward ‘life,’ the life of the society under study and of the individual within that society” (Yoder 1976:4).

The first general book on American folklife, *Zur Amerikanischen Volkskunde* (1905) was written by Karl Knortz (1841–1918) and was translated into English as *American Folklore* in 1988. Early English-language folklife titles included Heli Chatelain’s “African Folklife” (1897), William Greenough’s *Canadian Folk-Life and Folk-Lore* (1897), and Martha Warren Beckwith’s *Black Roadways: A Study of Jamaican Folk Life* (1929). In addition to folklife, terms such as “folk culture” and “regional ethnology” also are used to refer to holistic studies of traditional societies, particularly of regional-ethnic groups. From its relatively minor role in English American folklore scholarship during the late 19th century, folklife study has gained prominence in the United States, particularly after World War II.

The English scholarly approach of “folklore” inherited by the founders of the American Folklore Society was to limit the materials of folklore to oral tradition and to emphasize the organization of the subject by genres. Concentrating on the accumulation of narrative texts, English American scholars often constructed histories of literary types and themes. Folklife scholars expanded the cultural materials under study to all products of tradition, including rituals, customs, crafts, architecture, clothing, furnishing, and art. They also included the mental aspects of culture, such as concepts of shelter, settlement, space, and time. They organized the subject by cultures or culture areas and attempted to integrate the many aspects of culture in a regional or community context, taking into account cultural patterns, historical and geographical conditions, and social changes and movements. Using the active social references of “life” and “culture” as keywords, they examined their subject as a living tradition and, therefore, applied a combination of sociological, ethnographic, and historical methods.

German, Swedish, and Irish scholars used folklife and folk-culture research particularly in relation to enclosed peasant societies. Rooted in place and conducting their

lives according to tradition, peasants appeared to live in a community-bound folk culture. Because such cultures were considered stable over time but variable over space, they were examined to map the extent of regional and ethnic influence and relationships of cultures to one another. Within the communities, scholars analyzed the integrative functions of traditions within a society. Comparing the patterns of customs, narratives, architecture, and crafts, folklife scholars also sought to uncover guiding concepts (also called “base concepts” or “worldview”) of space, behavior, and time. In some nations, peasant societies were considered to constitute the cultural roots of the nation, and uncovering such concepts was thought to offer insights into the social patterns of national societies.

In the United States, European-type peasant societies were thought not to exist, but folklife scholarship found adherents particularly among Pennsylvania German researchers, who found the model appropriate to studying the community and regional variations within an ethnic-agricultural settlement. The Pennsylvania German folklife scholars emphasized the formation of traditional community life. As early as 1882, Phebe Earle Gibbons brought together descriptions of language, religion, festivals, quiltings, farming, holidays, and manners and customs to discuss communities of Pennsylvania Germans (Gibbons 1882). In 1888 Walter James Hoffman departed from the typical contents of the *Journal of American Folklore* by including considerations of foodways, architecture, and custom alongside speech and narrative (Hoffman 1888). In 1900 F.J.F. Schantz published *The Domestic Life and Characteristics of the Pennsylvania-German Pioneer* under the imprint of the Pennsylvania German Society, and up to World War II, Pennsylvania German researchers such as John Baer Stoudt, Preston Barba, and Thomas Brendle made substantial contributions to the study of Pennsylvania German folklife.

The big boost for the folklife movement in the United States came in 1948 when Alfred L. Shoemaker, who had studied folk culture in Germany, Switzerland, Ireland, and Sweden, established the first Department of Folklore in the United States at Franklin and Marshall College in Lancaster, Pennsylvania, and organized it around a folklife approach. With Don Yoder and J. William Frey, he directed the Pennsylvania Dutch Folklore Center, which published the *Pennsylvania Dutchman* (subtitled *Devoted to Pennsylvania Dutch Folk-Culture*) and held seminars on the “Folk Culture of the Pennsylvania Dutch Country” (intended for “serious students of American folk-life”). In addition, the center compiled an archive called the “folk-cultural index,” organized what came to be America’s largest folk festival, and began the Pennsylvania Folklife Museum. Shoemaker published studies in folk culture, including books on the Pennsylvania barn and on Christmas and Easter customs. “The center” Don Yoder recalled, “was based on European models and its purposes included the collecting, archiving, and disseminating of scholarly information on every aspect of the Pennsylvania German culture. In 1956, under the influence of the European *Volkskunde* and folklife (regional ethnology) movements, we changed the title of our organization to the Pennsylvania Folklife Society and the name of the periodical published by our society from the *Pennsylvania Dutchman* to *Pennsylvania Folklife*. In this way we felt that we might do justice to all of Pennsylvania’s ethnic groups” (Yoder 1982:18). Inspired by the appearance of *Ulster Folklife* in 1955, *Pennsylvania Folklife* became the first in the United States with “folklife” in its title.

In 1963 Yoder proclaimed the “folklife-studies movement” to be launched, and he called for research in regions outside Pennsylvania and applications in colleges, museums, and historical societies. At the University of Pennsylvania, Yoder became part of the first Ph.D.-granting institution with folklife in its title—the Department of Folklore and Folklife. Influenced by events in Pennsylvania, the Cooperstown graduate program, granting the M.A. degree in American folk culture with required courses in folklife research (sponsored jointly by the New York State Historical Association and the State University of New York at Oneonta from 1964 to 1979), was established by Louis C. Jones. In the Midwest, the Folklore Institute at Indiana University included folklife courses taught by Warren Roberts. In 1965 Jones helped bridge European and American folklife (Wildhaber 1965), research by publishing a translation of European *Volkskunde* scholar Robert Wildhaber’s bibliography of American folklife (Wildhaber 1965), and further communication was heralded in 1967 by the publication of “An Approach to Folklife Studies,” by Scottish folklife specialist Alexander Fenton, in the Pennsylvania journal *Keystone Folklore*.

A major contribution of folklife research to the English American model of folklore scholarship was a broadening of scope to include material culture. Norbert F. Riedl in 1965 made a special plea for the use of German *Volkskunde* research and its use of material evidence in American scholarship. In 1968 Henry Glassie, a product of the Cooperstown and Pennsylvania programs, demonstrated the appropriateness of folklife and material-culture research for a diverse American society in *Pattern in the Material Folk Culture of the Eastern United States*. On the basis of diffusion patterns evident from architecture, food, and craft, Glassie identified regional cultures emanating from four historic cultural “hearths” on the Eastern seaboard: North, Mid-Atlantic, Lowland South, and Upland South. Whereas Glassie emphasized historical development of regional cultures, more of the ethnographic approach to the individual in folk art and material culture was evident in the work of Michael Owen Jones, who studied at Indiana University and later taught in the Ph.D. program at UCLA. From the 1960s to the 1980s anthologies appeared—such as *Forms upon the Frontier* (1969), edited by Austin E. and Alta S. Fife and Henry Glassie; *Folklore and Folklife* (1972), edited by Richard M. Dorson; *American Folklife* (1976), edited by Don Yoder; and *American Material Culture and Folklife* (1992), edited by Simon J. Bronner—including both historical and ethnographic approaches to folklife and covering a broad range of groups, communities, and regions in North America. The scope of folklife research extended to Louisiana Cajuns, inner-city Blacks, Mexican Americans in northwest Mexico, African Americans from the South Carolina Sea Islands, and upstate New York Yankees. Indicating this expanded scope, a Ph.D. folklife program was established in the American Civilization Department at George Washington University in the nation’s capital.

In addition to making inroads into American academe, folklife became well established in the public sector during the 1960s and 1970s. Begun in 1967, the Festival of American Folklife on the National Mall in Washington, DC, led to the formation of the Office of Folklife Programs at the Smithsonian Institution in 1977. In 1974 the National Endowment for the Arts developed its folk-arts program to award grants for the presentation of community-based traditional arts and artists. In 1976 the American Folklife Preservation Act was passed establishing the American Folklife Center in the Library of Congress. The act defined folklife as “the traditional expressive culture shared

within the various groups in the United States: familial, ethnic, occupational, religious, regional” and directed the center to “preserve and present American folklife” through programs of research, documentation, archival preservation, live presentation, exhibition, and publication. As a result of these developments, the folklife movement is especially evident in the public sector. Of the forty-four public programs listed in the 1992 American Folklore Society directory, thirty-seven use folklife, folk culture, or folk arts in their titles. Museums employing folklife research, sometimes called “folk museums,” representing regional and ethnic cultures abound. Many museums such as Old World Wisconsin or the Museum of Frontier Cultures present outdoor village settings and demonstrate customs and practices of traditional cultures.

The folklife movement during the 1990s has been successful in introducing ethnographic concerns for individual and community contexts into American folkloristic practice. It has broadened the scope of the materials that folklorists study. Folklife has become an addendum rather than a replacement or umbrella term for text-based folklore research; as the titles of Dorson’s textbook *Folklore and Folklife* (1972) and the University of Pennsylvania’s Department of Folklore and Folklife indicate, it is frequently paired with, but second to, folklore in descriptions of the studies that folklorists undertake. Contrary to the agenda of the pioneer American folklife scholars, “folklore” has not been categorically subsumed by folklife. One indication is the handling of the potential confusion between folklore and folklife in Jan Harold Brunvand’s influential textbook *The Study of American Folklore* (1968, 1978, 1986). While conceptually defining folklife broadly as “the full traditional lore, behavior, and material culture of any folk group, with emphasis on the customary and material categories,” Brunvand, under the heading of “Folklife and Folklore,” nevertheless invoked “current usage” in his narrower operational characterization of folklife “to mean only customary and material folk traditions, even though there is good reason to substitute the word immediately and permanently for the much-abused term ‘folklore.’” (Brunvand 1986:401).

While widely employed, the keyword of “folklife” often lacks clarity, for it may be used loosely for the concern for context or the use of material evidence, or more specifically for an interpretation using the sociocultural idea of traditions serving integrative functions in a community. Folklife research originally claimed a distinction years ago because it focused on local social context and behavior in contrast to the kind of literary treatment that sought the global view of tradition. Yet, built into the folklife effort was the assumption that data could become comparative, even quantifiable, and that the role of the researcher was to systematically compile data and interpret the patterns of everyday life for individuals and their communities across time and space. Europeans had a head start, pioneer American folklife scholars opined, but with the rapidly growing vigor of American folklife studies, they imagined that traditional culture on the American continent could be charted and analyzed. The message of the the 1990s has been that, while promising, carrying out the social philosophy of accounting for each traditional community and activity in nations as complex as the United States and Canada is immense and problematic. In addition, the important psycho logical concern for investigating individual lives in the practice of tradition brings even more burden to this great task. Attempts to coordinate folklife research in the form of a cultural atlas for the

United States have not been successful, and efforts to organize team research in communities has been all too infrequent.

The lobbying efforts of the American folklife movement has taken different turns. In the mid- 1990s, there is still an active discussion of a single term—folklore, folklife, folk culture, regional ethnology—to describe what American folklorists do. Whether folklore is paired with folklife or subsumed under folklife implies certain strategies and directions for American students of tradition. Another point of discussion is the adaptation of folklife methods typically oriented toward bounded rural communities to diverse urban and postindustrial settings. The ethnography of organizations such as corporate cultures, boys' groups, and universities suggested by Michael Owen Jones, Gary Alan Fine, Jay Mechling, and others addresses large issues of how and why subcultures are created. Another issue is the role of the individual adapting to communities by negotiating between personal creativity and social tradition (Bronner 1992). This aspect is especially important to American folklife researchers commonly working within a field with mobile social networks, individuals with multiple cultural heritages and identities, and extended, often temporary, communities. The applications of folklife activity in public settings continues to be another concern of the new folklife movement, and new uses of folklife besides museums and historical societies in areas of education, human services, and government are actively being pursued (Jones 1993).

Folklore

Word coined in 1846 (to replace the term “popular antiquities”) by English scholar William J. Thoms, who defined it as “*the Lore of the People...* [comprising] the manners, customs, observances, superstitions, ballads, proverbs, etc. of the olden time.” To some degree, the antiquarian tone and the openended enumerative format of Thoms’ concept of folklore has remained, while at the same time the word has acquired several new connotations and faces competition from such terms as “folklife,” “expressive culture,” “traditional culture,” “verbal arts,” and “vernacular culture.” The greatest divergence in the 20th century from the original concept of Thoms and his times concerning folklore has been to remove the emphasis on the rural and the past in order to include now as well the “lore” of the modern, the urban, and the technologically advanced times.

The English word “folklore” itself gained international currency having its counterparts in such forms as *Volkskunde* in German and *folkeminne* in Norwegian. In English, folklore inspired compounds like folktale, folksong, folklorist (one who studies folklore), and folkloristics (the field of folklore study), as well as the negative term fakelore. The British FolkLore Society, founded in 1878, and the American Folklore Society, in 1888, both continue to this day. Still, there is considerable debate (especially in the United States) about exactly what parts of culture the word “folklore” refers to, and there is much disagreement on the wording of a suitable definition of the word. As a result, the editors of the *Standard Dictionary of Folklore, Mythology, and Legend* (1949) simply allowed each of twenty-one contributors to submit his or her own definition, and all of these statements were published in lieu of an agreed-upon common definition. But, as American folklorist Kenneth Goldstein suggested, “Despite variance of opinion, there is a certain core of materials which all definitions recognize as belonging to folklore.”

The three common features of the numerous cultural elements (including proverbs, tales, songs, dances, games, toys, foods, fences, and so forth) that are included in most folklorists’ concepts of what comprises folklore are: (1) that these elements are transmitted orally or by means of informal demonstration; (2) that these elements are traditional in form and content; and (3) that these elements (as a result of their traditional circulation) always exist in different versions, or “variants.” Secondarily, in a minimal definition of folklore, most folk-traditional elements of culture are anonymous as to origin, and they tend to become formularized in the ways that they are performed or expressed. Similar concepts of folklore prevail in the wording of most definitions of the word, including, for example, Jan Harold Brunvand’s definition, Robert A. Georges’ (“continuities and consistencies in human behavior...[expressed] during face-to-face interaction” [1980]), and Barre Toelken’s (“tradition-based communicative units informally exchanged in dynamic variation through space and time” [1979]). Another viewpoint, however, is that of Elliott Oring, who wrote in 1986: “At this point, a definition is not really necessary. The field is still being mapped and any hard and fast definition is likely to prove partial, idiosyncratic, or inconsistent.”

Beginning in the 1950s the European folklife movement (named after the Swedish word *folkliv*) began to strongly influence American folklore studies, inspiring more attention to customary and material traditions instead of primarily oral traditions. For example, Richard M. Dorson had written in 1959: “‘Folklore’ usually suggests the oral traditions channeled across the centuries through human mouths. In its flexible uses folklore may refer to types of barns, bread molds, or quilts; to orally inherited tales, songs, sayings, and beliefs; or to village festivals, household customs, and peasant rituals. The common element in all these matters is tradition.” But in 1968, taking these ideas further, Dorson admitted that “my own view of the subject matter of the folklorist has shifted somewhat from the established genres to what might be called the unofficial culture.”

In 1976, a major piece of national legislation supporting folklore study was enacted, The American Folklife Preservation Act, which established in the Library of Congress the American Folklife Center. The short definition of “American folklife” quoted in the act was “traditional expressive culture shared within the various groups in the United States: familial, ethnic, occupational, religious, regional...mainly learned orally, by imitation, or in performance, and...generally maintained without benefit of formal instruction or institutional direction....”

In the 1960s, a strong behavioral, or performance- and communications-oriented, movement influenced younger American folklorists, whose statements of their “new perspectives” on the theory and practice of folklore research found expression (among other places) in 1972 in a special issue of the *Journal of American Folklore*. Distilling the essence of this approach in a concise phrase, Dan Ben-Amos proposed as a definition, “...artistic communication in small groups.” The major influence of the behavioral approach is a shift in focus from recording merely the items of folklore and their histories to analyzing the processes and functions involved in the events in everyday life during which folklore is performed. Echoing most of the varying approaches to folkloristics of the past and present, the American Folklore Society itself, in a booklet published in 1984, declared: “We now speak of folklore/folklife as song and story, speech and movement, custom and belief, craft and ritual—expressive and instrumental activities of all kinds learned and communicated directly or faceto-face in groups ranging from nations, regions, and states through communities, neighborhoods, occupations, and families.”

Although the aspect of constant variation of folk materials and folk expressions is something that is not always stated directly in their formal definitions, the scholars’ interest in different “versions” and “variants” is amply demonstrated in many of their published studies. In a booklet written by folklife specialist Mary Hufford, titled *American Folklife: A Commonwealth of Cultures*, published in 1991 by the American Folklife Center, the importance of folklore variation—changes in both form and in function—is emphasized in a paragraph that begins: “Traditions do not simply pass along unchanged.”

In the 1980s, influenced by such movements as Marxism, feminism, postmodernism, and cultural studies, American folkloristics made yet another change of direction, this time toward what is often referred to as “the culture of politics” (or “the politics of culture”). The introduction (published in 1993 in *Western Folklore*) to a 1992 American Folklore Society symposium that reviewed the “new perspectives” of twenty years before states simply that “folklore as a discipline is concerned with the study of traditional,

vernacular, and local cultural productions.” The editors further suggest that folkloristics examines “the ways in which traditionalizing (identifying aspects of the past as significant in the present) [is] a dynamic cultural process.” But the editors also warn that some people “...have challenged the authority of any nation, group, gender, or class to represent the experience of an-Other.” Thus, these contemporary folklorists allude to the political nature of current folklore study in the United States. No longer does it seem politically correct to define folklore (even jokingly), as one American folklorist did in 1973, as”...what folklorists study,” since we must now be aware of who is studying whose traditions, plus how, why, and for whose advantage the study is being conducted.

Folklore and American Literature

Study of the relationships between American folklore and American literature, these relationships involving both of the disciplines and their materials. It is difficult to separate the discipline of American folklore from that of American literature because the two fields developed from common interests and an overlapping group of scholars. Their early histories are inevitably bound together. Academic training in folklore was begun in the United States at Harvard University by Francis James Child and George Lyman Kittredge, scholars of language and literature. The American Folklore Society, formed in 1888, began only five years after the creation of the Modern Language Association of America and included several literary scholars and writers, among them Mark Twain, Joel Chandler Harris, and Edward Eggleston, as charter members. The study of folklore for some time was widely accepted as a key component to the study of any national literature, modern or classical; as a result, folklore courses in the late 20th century are still most often taught in university Departments of Language and Literature. Over time, both disciplines have grown. Folklore, like linguistics, comparative literature, computer science, and other 20th-century offspring of well-established academic areas, has come to generate its own disciplinary identity. Nevertheless, the American Folklore Society and the Modern Language Association of America still have a number of close ties, many common members, and similar interests among the memberships.

As for the materials themselves, almost inevitably scholars have begun their task by considering folklore and by trying to differentiate it from literature. Even though folklore is related to many other disciplines—from art and architecture to music and recreation—literature has remained the key one. Scholars have proposed at least three different means to distinguish the materials.

One viewpoint is that while literature is an art, folklore is more like a craft; in other words, folklore is literature minus the art. This may be fairly characterized as an elitist view of literature, although American folklore's historical pursuit of marginal peoples—rural, poor, immigrants, and others—and their folklore has certainly contributed to this perception. This view denies that folk arts are art at all, and tends to be fundamentally socioeconomic- and class-based; that is, the wealthy can afford (both in money and time) art, while the working class may not, and the poor and isolated cannot, and therefore they have none. Conversely, rural and poor peoples have folklore, while urban, educated, and wealthy Americans do not.

American folklorist Alan Dundes has proposed that “we are all folk,” and this conception is particularly appropriate for the United States, a country founded upon democracy, equality, and freedom. This viewpoint has ramifications as to who has art, including verbal art. No longer is art necessarily elite, something necessary to import into rural and impoverished communities; indeed, folklorists, anthropologists, and other scholars have turned their attention to “indigenous” arts or folk arts that arise from, and already exist in, traditional communities. Also, American folklorists have worked for more than a generation to document and study urban folklore. Nevertheless, artistic status

and significance are granted more easily to formally trained performers in tuxedos and evening dresses on a concert stage than to traditional blues singers performing in a nightclub or storytellers on a porch. In American culture, however, fine storytellers are, in fact, “verbal artists.” Similar cases can be made for wood-carvers, clock makers, quilters, potters, and other folk performers—art is fundamental to them all. In fact, one of the similarities between American folklore and American literature is that historically they are *not* class-based. American authors have come from all groups and classes, and the same is true for American folklore. All classes and groups in America have art, literature, and folklore, even if they have not all yet been studied adequately.

A second viewpoint—the belief that folklore and literature are fundamentally and clearly separable, according to one criterion or another—has led to a number of dividing lines, none of which finally stand up to scrutiny. Perhaps the most commonly used is that of *medium*; that is, folklore is oral, while literature is written. Some scholars from both literature and anthropology see this as a firm dividing line and then consider folklore as simply the precursor of literature, because cultures developed oral communication before writing. Thus, for example, H. Monro and Nora K. Chadwick’s monumental study *The Growth of Literature* (3 vols. 1932–1940) views folklore (including ballads, romances, and epic) as the predecessors to written works of literature in cultures around the world. To be sure, oral folklore did precede written literature, but oral folklore has not died out over the thousands of years since writing or even the hundreds of years since printed books have been available. Nor have literary works necessarily developed in all cultures that have developed writing and print. Thus, to depict the distinction as unidirectional and evolutionary based on technological development is misleading and simplistic. Indeed, oral traditions have persisted, and new traditions have been created; they are all thriving well into the era of electronic communication.

Further complicating the matter is that the line drawn according to the medium of transmission is no longer widely accepted. Folklorists have accepted and studied a number of traditional written forms, including graffiti, and literary scholars have moved away from the criterion of writing. After all, there are still thousands of different languages active within the United States. Is it accurate to conclude that so many cultures have no literature? If by “literature” one means written works of artistic merit, then yes, but more and more literary scholars have adopted the term “oral literature” as a means of acknowledging and accepting oral performances as works of artistic merit and significance as well. As a result, the claim that medium provides a clear distinguishing line between folklore and literature is no longer valid.

A number of other criteria for distinction between folklore and literature have been proposed, most based upon a gross generalization from a few select, but not always representative, examples. For example, attempts have been made to differentiate the materials according to *permanence*. That is, folklore is fluid and transitory, while literature, because it is fixed in print, is permanent. Here one must consider what is meant by permanent. While it is true that most folklore is transitory in the sense of its orally performed characteristics, one must recall that oral genres and even specific texts can be traced back several thousand years. The texts of many literary works are hardly as “fixed” as some literary scholars represent, and their reputation or place in the culture can change just as dramatically and quickly as oral performances. Thus, permanence has not turned out to be a wholly satisfactory or clearly distinguishable characteristic. Another

criterion proposed has been the *orientation*: folklore expresses the traditional within a culture, while literature (as art) forsakes the traditional for the creative and innovative. To be sure, folklore does capture traditional aspects of a culture, but each performer invigorates the traditional with his or her own creative use in performance, and literature certainly has its own traditional elements. Therefore, literature and folklore cannot be fairly characterized as though one looks forward while the other looks backward; they are both complex artistic forms combining traditional elements with innovation in performance. Still other scholars have attempted to separate them according to what might be termed *ownership*: Literature is signed and identified, while folklore is anonymous. This may be due more to convention and copyright law than anything else, but, even so, it is not completely true. Many literary works, such as Walt Whitman's *Leaves of Grass*, were published anonymously, while in many cultures certain stories are told only by (and thus, in effect, "owned by") a particular performer. Others have suggested *complexity* as a distinguishing criterion: Literatures style and structure is more complex than folklore's. This distinction depends in large part upon which works one selects as representative examples of literature and folklore. Furthermore, it depends on how scholars account for all of the different levels of complexity—including metrics, structure, and style. Finally, some scholars persist in asserting that folklore and literature are distinguished by *who creates it*; that is, folklore is created by groups, while literature is generated only by individuals. Folklore scholars long ago dismissed the notion of folklore being created by groups. Individuals generate performances for others, whether they read or listen in groups or individually.

In general, the attempt to create neat and simple dichotomous categories for folklore and literature has led to frustration. In fact, the boundaries between folklore and literature are neither natural nor secure. Any number of works are problematic. What does one call *The Odyssey*, Grimm's *Household Tales*, or Joel Chandler Harris' *Uncle Remus: His Songs and Sayings*? Are these examples folklore, oral literature, orally based literature, literature based upon folklore, or simply literature itself? Perhaps one key to understanding that cultural expressions can be either—and even both—and that the interaction between folklore and literature is necessarily fluid and complex lies in realizing that folklore and literature are different kinds of cultural products, valued essentially by different groups.

Literature, at least until quite recently, has been viewed primarily as a written product (although in the 1990s this is being revised to include oral forms for many cultures) whose value and significance are not limited to the ethnic and national group from which it comes; that is, the artistic merit and human values expressed are not specific or unique to one culture. Indeed, in some cases it has been readers from other cultures around the world who have called attention to particular artists' works, rather than readers within the author's native group. In contrast, folklore is a wider category (in that it includes more than verbal forms), but the value and significance of traditions are fundamentally within or between particular cultures. As a result, outsiders may see folklore as exotic, quaint, or even disturbing in contrast to their own familiar artistic expressions. Both folklore and literature, therefore, function as artistic and significant cultural expressions for their respective audiences.

Particular examples of folklore—proverbs, songs, tales, legends—have been recorded, transcribed, printed, and distributed to become part of American literature. Examples

range from American Indian myths and folktales to Anglo American ballads and folksongs. The original oral tradition may continue independent of, and perhaps wholly oblivious to, the written product. Similarly, a work of literature can help generate an oral tradition while the original written work remains intact. Biographical narratives about famous American figures—from George Washington and John F. Kennedy to Lizzie Borden and Marilyn Monroe—have helped create or spread stories into oral tradition. Further, a written tradition may interact with an oral tradition in any number of different ways. In fact, the history of American culture provides many rich opportunities for case studies of the interaction between folklore and literature.

The study of the relationships between American folklore and American literature is complex at least partly because any artist, whether oral or a writer, takes some cultural knowledge and combines it with creativity and inspiration, and thus inevitably reshapes the raw material. There are often differences, sometimes quite major, between one work and another. One might consider the difference in form and style between traditional American Indian tales, Henry Rowe Schoolcraft's *Algic Researches* (1839), and, finally, Henry Wadsworth Longfellow's *Hiawatha*. Connections between folklore and literature in general, and specific texts in particular, may seem obvious, but folklorists have learned to assess relationships very carefully. Richard M. Dorson proposed that scholars studying the relationships of folklore and literature consider at least three kinds of evidence (biographical, internal, and corroborative) before asserting any direct connection (Dorson 1957). *Biographical evidence* would include pertinent data that an author did indeed know about a particular culture and information about how he came to know it firsthand. Longfellow, for example, never lived among American Indians as preparation for writing *Hiawatha*, nor did he live among Cajuns before he wrote *Evangeline*. On the other hand, George Washington Cable grew up and lived much of his early life in New Orleans and was employed by the U.S. Census Bureau for work across southern Louisiana. His representations of Cajuns and Creoles, while not always flattering to those cultures, are at least based on his personal experiences. Dorson's *internal evidence* involves evaluating whether a particular product (tale, song, proverb, joke, and the like) is set in an appropriate context for the particular culture and community represented. If the writer faithfully depicts the scene, this adds evidence that the writer does indeed have firsthand knowledge of the culture and its folklore. Finally, *corroborative evidence* consists of proof that the particular material (a story, proverb, joke, custom) has had an independent traditional life. This requires checking other appropriate collections to confirm the existence of this item in oral tradition. For instance, examining collections of Cajun folk history and legends will produce virtually no evidence for an oral version of *Evangeline*. On the other hand, Mark Twain recalled a traditional ghost legend ("The Golden Arm") told to him in his youth and wrote Joel Chandler Harris to ask if he knew the story as well. Harris had not heard it, but he later collected it and used it as the basis for a tale in *Nights with Uncle Remus*, while Twain used his version for part of the essay "How to Tell a Story"—and alternated between the two versions in his performances on the lecture circuit.

The history of American literature is inevitably and deeply tied to American folklore. Early American writing clearly contains numerous examples of folklore and stands as an expression of Americans' peculiar concerns and experiences. Illustrations abound in Richard M. Dorson's *America Begins: Early American Writing* (1950), a sourcebook of

American colonial writings. The volume contains selections from many familiar colonial authors: John Josselyn, Increase and Cotton Mather, John Smith, John Winthrop, and others. However, Dorson groups the readings not by author and work but according to issues and themes pertinent to those encountering the New World: voyages to the New World, natural wonders, remarkable providences, Indians (including captivity stories), witchcraft, and so forth. By doing this, Dorson illustrates the colonists' lifestyles and culture as manifest in both their folklore and the written accounts. These early American writings are strongly rooted in American folklore and New World experiences.

Over the next century and a half, however, prominent American writers looked more to the Old World for models, especially literary models. Forms popular in France, Germany, and England became the norm for American writers—the essay, short story, and romance among prose forms, for example. With those forms came their concerns, including class distinctions and the development of refinement and taste.

By shortly after the Civil War, at least one prominent writer spoke up to criticize American literature—specifically, for forsaking American folklore and American themes. In fact, Walt Whitman, in *Democratic Vistas* (1877), claimed that so far there was virtually no American literature. He recognized that the heart of any national literature was what made that particular culture different and unique—especially its experiences and its peculiar genres. Whitman denounced earlier American writers for following Old World themes and Old World forms, such as the romance. He argued that American writers instead should pay attention to American experiences, such as the Civil War. He pointed out that the national character of Old World countries was best found and expressed in their ballads (part of their folklore), and that the goal for American writers was to find the appropriate forms for this in the New World. To be sure, Whitman's contribution to American literature is not at all limited to this stance. His free verse broke the tradition of English metrics and offered opportunities to future generations of writers, and for much of his career he wrote powerfully about America and his love of it (including "I Hear America Singing," "Song of Myself," and many other works). Still, Whitman is remarkable in his outspoken views about the importance of America (the New World); its folklore, its themes, and its forms of American literature were to develop as something more than an emulation of Old World authors and styles.

Whether one attributes the change to Whitman or not, American literature changed during the 19th century and moved to incorporate and depict American experiences, themes, and issues, including the Civil War, slavery and racial prejudice, opportunities for economic success, the woman's changing role in society, and the Vietnam War, among others. New forms—such as slave narratives and other kinds of life stories—became important sources. Many American writers, from Horatio Alger and Edward Albee to John Barth and T.S.Eliot, from William Faulkner and Sylvia Plath to William Styron and Eudora Welty, have used folklore in some ways in their writings. Clearly, the focus on the American experience, including its particular themes, issues, and folklore, has had a major impact on American literature.

Literary critics, however, have sometimes associated folklore primarily with regional literature. In their view, folklore consists primarily of regional dialects, folk humor, and peculiar character types and is chiefly found in humorous writings of the Old Southwest and New England. The impact of folklore is much broader than this and is by no means limited to regional literature. In fact, the finest works of American Literature are deeply

rooted in American folklore; including Herman Melville's *Moby Dick*, Twain's *The Adventures of Huckleberry Finn*, Ralph Ellison's *Invisible Man*, Faulkner's *Absalom, Absalom*. Several writers specifically address the importance of folklore in American life. Huckleberry Finn, for instance, learns far more about life and how to live among others from the runaway slave Jim than from his book-learned friend Tom Sawyer. Jim's lessons, often on signs and customs but occasionally using personal narratives, are often humble, but always heartfelt, and it is his respect and affection to which Huck ultimately responds.

In the past, the primary focus and methodology for studies in folklore and literature lay in the identification of items of folklore within works of literature. Over the last several decades, scholars have urged that both identification and interpretation be part of the process: that is, if folklore is indeed part of a written work, how and why is that relevant? How does the folklore influence the audience's associations and perceptions? Most recently, the area of folklore and literature has expanded to include the complex interactions between the two related expressive forms. This includes not just the identification of, and relationships between, particular texts, but also the choices that artists make when creating a work in a particular medium or tradition. In some cases, issues such as form (genre), style, structure, and tone may be just as significant as the text. Quite a few American writers, including Washington Irving, Nathaniel Hawthorne, Twain, and others have used the fairy tale (*Märchen*) form—not a traditional *American* oral form—for a wide range of purposes. James Thurber's "The Girl and the Wolf," for example, parodies the form. More recently, authors have turned to this form in an attempt to redraw the distinctions in the roles in traditional tales. Because the study of folklore and literature involves expressive forms that are fluid and that interact with each other, this area has also grown to include the relationships of orality and writing in general. The study of oral performance, composition, aesthetics, and repertoire has become inevitably connected to the study of writing, print, and electronic media. In many contemporary cultures, performers must choose from among several media and many forms. Those studying the relationships between folklore and American literature can contribute to a better understanding of how artists make their choices and how creativity can be expressed and manipulated.

Folk-Say

A term coined by Benjamin A. Botkin and first publicly used as the title of the regional literary anthology he created and edited from 1929 to 1932 while teaching at the University of Oklahoma. The *Folk-Say* volumes contained literature of the folk, literature about the folk, and discussions of the meaning of the terms “folk” and “lore.” Throughout a long career, Botkin continued to use the term and to elaborate on its meaning. After a lifetime of studying folklore, he wrote,

“My dual interest in the folk values of literature and the literary values of folklore, with which *Folk-Say* began, did not end with the series but continued to grow and expand in a number of directions, interregional and interdisciplinary, with special emphasis on the interrelations of written and unwritten traditions and history and sociology.”

Given both the academic and the popular understanding of the term “folklore” in 1929 (and later), Botkin thought he needed a new word to cover the cultural phenomena he wanted to examine and to encourage. From the beginning, the word “folk-say” was associated with Botkin’s belief in the value of regional folk traditions, in interdisciplinary approaches to the study of the folk and their lore, in an acceptance and celebration of American diversity, and in a role for the student of folklore in promoting intercultural understanding and a cultural renaissance through the study and appreciation of folklore. By using the term “folk-say,” Botkin also wanted to call attention in particular to the relationship between oral and written literature (between “folk-say and book-say,” as he once put it), and in general to the constant interaction he saw in the modern world among folk, popular, and high culture. The very term “folk-say” described a contemporary activity and, therefore, constituted an implicit rejection of the idea that folklore was a vanishing survival of an early stage in humankind’s evolution that was destined to disappear with progress.

Botkin coined folk-say, he later wrote, “not as a substitution for ‘folklore,’ but as an extension of it.” He wanted a word “possessing a wider and fresher connotation, not fixed by academic usage.” Botkin thought folk-say emphasized “*folklore as literature* rather than as science,” called attention to the “*oral, linguistic, and story-telling...aspect of folklore and its living as well as anachronistic phases,*” focused on “*literature about the folk as well as literature of the folk*” (emphasis in original), and, unlike the word “folklore,” did not have the ambiguous “double sense of the material and its study.” (This last explanation is the same as that given in defense of the term “folkloristics,” a subject of more recent debate.)

When Botkin became folklore editor of the New Deal’s Federal Writers’ Project (FWP) (1938–1939), he saw an opportunity to present folk-say to a larger audience than he had previously. As in the *Folk-Say* anthologies, his idea involved experimenting with ways of offering this material to a diverse American audience. Looking back at his work

on the FWP, Botkin wrote: "Next to collection, the most important problem was presentation. In the attempt to reach a large audience, we emphasized the folk-say (oral, linguistic, and story-telling) aspects of folklore." He also noted a shift in emphasis from his use of the term during his Oklahoma period. Earlier he had employed folk-say to indicate his rejection of evolutionary anthropology's view of history and the role of studying folklore as a relic useful in reconstructing earlier stages in human history. Working on the FWP, Botkin wrote, he had moved from a primary concern with folk-say as literature to an exploration of folk-say as history. A direct connection runs through the mix of materials that Botkin included in the *FolkSay* volumes, his encouraging creative writers on the FWP Living Lore units he created to listen actively to ordinary folksay, and the editorial procedures that governed his selection of materials for his later work, such as *A Treasury of American Folklore* (1944) and his other regional and topical folklore treasuries.

Richard M. Dorson's 1950 neologism "fakelore" attacked not only the legitimacy of the materials Botkin called folk-say, but also the role Botkin advocated that folklorists play in the larger culture. Botkin, nevertheless, or perhaps in response, reiterated the idea that the term "folk-say," indicated not only a new definition of the material to be studied, but also a new role for the folklorist and a new relationship between the folklorist and the layman. At a time when his critics, such as Dorson, regarded interdisciplinarity as a threat to their effort to establish folklore as a respected discipline in the academy, Botkin insisted that a proper study of folk-say was inherently interdisciplinary.

Botkin gave a central place to the history of his use of the term "folk-say" in his 1953 essay "Applied Folklore: Creating Understanding through Folklore," a major theoretical statement about the role of the folklorist and the utilization of folklore (Botkin 1953). In this article, Botkin noted that while working on the FWP, "folk-say came to mean what the folk have to say not only for but about themselves, in their own way and in their own words," what he began to call "own stories" and folk history. He had viewed it as his responsibility as a folklorist to see that the FWP shared with other Americans what it had learned from the folk-say it had recorded. In an unpublished 1967 conference paper that constituted an intellectual biography of his ideas about folklore, Botkin declared, that "in the interdisciplinary and intercultural folklore studies of the Federal Writers' Project, I made the workers' and their informants social problems so much mine that 'living lore,' folk-say, myths, and symbols came alive for me in a very personal and practical way and I acquired not only a social point of view but a liberal social education" (Botkin 1967a).

In a 1967 article, Botkin commented on the history of folk-say in American dictionaries (Botkin 1967b). He reported that the term had been noted for the first time in the *American Collegiate Dictionary* in 1947 and in the *Random House Dictionary of the English Language* in 1966. In both cases, there was a narrow emphasis on sayings of the people. In the 1990s, lexicographers largely ignore Botkin's neologism. Nevertheless, the term reflects not only the outlook of a prominent American folklorist, but also an important phase in the history of American folklore studies. Although the use of the term has narrowed and declined, the values that Botkin advocated in his use of folk-say are now shared by many folklorists.

Folksong

Traditional sung verse that exhibits characteristics shared by other kinds of folklore. Its natural performance settings are customary occasions of group work, leisure, ritual, and play; its participants' social identities remain overwhelmingly those of neighbor, kin, or workmate and are not displaced by the personae of singer and audience member; it is social rather than personal in meaning and function; it enjoys a strong and direct relevance to "real life"; it displays continuity over time along with adaptability to each context of performance; and it relies heavily on stylized form and reusable content. Song traditions matching this depiction have decreased enormously in vitality since the late 19th century, particularly in Anglo American culture, as we have handed over what was once a kind of everyday practice to professional surrogates and become chiefly consumers of song rather than users of song, seldom participating in singing occasions keyed to the habits of daily life. Consequently, the picture sketched here is largely a historical one.

In their portrayals of the genre, folksong scholars have embraced a number of categorical schemes: by topic (for instance, songs about war, songs about thwarted lovers), by geography (folksongs of Indiana, folksongs of the South), by origin (imported songs, indigenous songs), and by culture group (songs of the cowboys, of the lumbermen), among others. For an overview of the present sort, however, the most frequently employed distinctive features have been the verses' poetic conventions, without reference to the music of songs, to the circumstances of their performance, or to singing style. In such an overview, folksong is a way of articulating a topic in sung verse, and over time several such "ways" have jelled into fairly distinct—but not mutually exclusive—models. We can recognize three such ways or models as dominant in Anglo American folksong tradition: the catalog, the lyric, and the ballad.

Even though probably the oldest of the three, the catalog has been least analyzed by folklorists. Indeed, we do not even possess a commonly agreed-upon name for the type, usually subsuming it under more empirically observable categories like lullabies, play-party songs, local songs, and so on, thereby masking the commonality of such pieces under a mishmash of disparate traits—functional, situational, and geographical, among others. But there is great formal unity throughout the type that these more parochial divisions disguise: In essence, the topic is held suspended in time and space and its component parts inventoried or listed (hence catalog). For example, members of a team of lumbermen are named and portrayed one by one (a common kind of catalog song, and not confined to occupational groups either, that are often called "moniker songs"), or if the topic is an individual rather than a group, his or her most salient traits are menued:

I wouldn't have an old maid;
I'll tell you the reason why:
Her neck's so long and stringy

I'm afraid she'd never die.

I wouldn't have a preacher;
I'll tell you the reason why:
He's always in the pulpit
A-preachin' chicken pie.

I wouldn't have a lawyer
I'll tell you the reason why:
He's always in the courthouse
Swearin' many a lie.

Similarity and/or contiguity among parts is a striking feature of catalog songs, not only in the portrayal of those parts (as in the consistently unfavorable depictions above), but even in actual verbal repetition. Indeed, some catalog songs, especially the cumulative (like "Old MacDonald Had a Farm") and dialogic (like "Soldier, Soldier Will You Marry Me?" or "Where Have You Been All the Day, Billy Boy?") kinds, depend for much of their effect on repetition. As these examples suggest, whenever song is linked with physical action, especially in group activity—game playing, dancing, manual labor, ritual custom—more likely the catalog will be the preferred model.

The second major genre of Anglo American traditional song is the lyric, the most recognizable surface feature of which is its subject matter: the emotional reaction of a protagonist (often the song's first-person "speaker") to a past experience rather than the nature of the experience itself. The lyric song articulates its topic by linking its images in a more sophisticated way than the catalog's listing method: Topic-parts are interrelated by imaginative associations of shared mood, texture, implication. For example:

Come all ye fair and tender ladies,
Be careful how you court young men.
They're like bright stars in a summer morning,
They first are here and then they're gone.

While many sacred songs follow the format, secular songs predominate in the traditional lyric repertoire; in these songs, sorrow and bitterness at a failed love affair are by far the most common emotions. Lyric songs in general, but particularly lyric love songs, are deeply symbolic in that their images connote strongly contrasting ideas like superfluity and dearth, amplification and abatement, movement and stasis:

Oh, love is sweet and love is charming
And love is pleasant when it's new.
But love grows cold as love grows older.

And fades away like the morning dew.

The third folksong model common in Anglo American community-singing tradition is the ballad. The ballad is like a tale in sung verse: It tells a story, and so links its stanza-images, or topic component parts, in a narrative way—actions result in reactions; causes are followed by effects; decisions lead to their implementation, and so on, all unified by a small cast of interacting characters and a chronologically unfolding “plot.” Folksong collectors have found four ballad subtypes prominent in American folk tradition, two inherited from Old World culture, one homegrown, and one whose flowering was more or less transatlantic. These are, respectively: the medieval, or Child, ballad (so called to honor Francis James Child, the great 19th-century authority on the genre), the broadside ballad, the blues ballad, and the parlor ballad. The Child type is the oldest, emerging in Europe in the late medieval period and remaining a usable model for new songs up to the late 1600s. More than 100 songs of this type have been found in 20th-century American singing tradition, all diffused to this country from the British Isles and more often than not retaining their premodern ambience (they often feature *dramatis personae* who possess titles, live in castles, and ride finely accoutered steeds). Child ballads are most notable within the ballad model for their internally symmetrical, balanced, parallelistic form, often very like the catalog but, of course, telling a story rather than just listing parts of the topic’s anatomy:

She had not been on sea three weeks,
I am sure it was not four,
Until fair Ellender began to weep,
And she wept most bitterly.

“Oh, do you weep for your house carpenter,
Or do you weep for your gold,
Or do you weep for your sweet little babe
Whom you never will see any more?”

“I neither weep for your gold,” said she,
“Neither do I weep for your store,
But I do weep for my house carpenter and sweet little babe
Whom I never will see any more.”

She had not been on sea three weeks,
I am sure it was not four,
Until the ship sprang a leak
And sank to rise no more.

The broadside ballad, is of more recent vintage, its emergence associated with the issuing of songs (invariably just the words) on single sheets of paper for sale on street corners, and at market stalls and country fairs. As folklorists use the word, “broadside” denotes primarily a style of song that coalesced in 18th-century Britain (though, once again, it was a pan-European form and followed European culture’s diffusion to other continents). It tells its simple tale more concretely than its older relative, the Child ballad, specifying the journalistic variables of who, what, where, when, how, and why; it is more linear, sequential, and not as repetitive in its plot development; and it betrays its relatively modern history by portraying a more varied society in which working- and middle-class people are invariably the main protagonists:

My name is Daniel Martin,
I’se borned in Arkansas;
I fled from those base rebels
Who fear not God or law.

I left my aged father
And my beloved wife;
I’se forced to go to Rollie
For to try to save my life.

I jined in Phillip’s regiment—
I’m not ashamed to tell—
My colonel and my officer
They treated me mighty well.

I served four months at Rollie
Through sleet, snow, and ice,
And next received my orders:
Go meet old Sterling Price.

The third ballad type is of American origin, though similarities to its way-of-telling-a-story-in-sung-verse can be found in other cultures. We call this type the blues ballad, and it fuses traits from African American song traditions, especially catalog and lyric types like worksongs and spirituals, with Anglo American song traditions, most notably (but not exclusively) the broadside ballad. The blues ballad holds up in sharp relief striking, dramatic scenes selectively chosen from its topic at large, unifying them with a common mood of celebration or lament, but, in ballad-like manner, the images generally follow a chronological sequence, though in a more fits-and-starts than cause-and-effect progression. And like so many broadside ballads—especially the indigenous American ones—a blues ballad is invariably based on an actual event in the region’s immediate past and does allude to people, places, and actions in a quasijournalistic way, though so

impressionistically and elliptically that someone unfamiliar with the historical event would be quite unable to reconstruct it in any detailed way from the song:

My father was a gambler, he learnt me how to play,
 My father was a gambler, he learnt me how to play,
 Saying, "Son, don't go a-begging when you hold the ace and tray,
 When you hold the ace and tray."

Chorus:

Hang me, O hang me, and I'll be dead and gone,
 Hang me, O hang me, and I'll be dead and gone;
 I wouldn't mind the hangin, it's bein' gone so long,
 It's layin' in the grave so long.

They took me down to old Fort Smith as sick as I
 could be,
 They took me down to old Fort Smith as sick as I
 could be,
 They handed me a letter saying "Son, come home to me,"
 Saying, "Son, come home to me."

The fourth ballad type is the parlor (or sentimental) ballad. Ballads of this type collected from American folk tradition often (but not always) date from the late 19th century and are traceable to known composers, many of whom copyrighted their compositions and issued them on sheet music. Parlor ballads exhibit a self-consciously "literary" style of more formal—and less formulaic—diction, greater unity and continuity of plot, stricter regularity in meter and rhyme, and especially more extravagant expressions of sentiment than do other ballad types, even the broadside ballad:

Oh, the sun was setting in the west,
 And it fell over the lingering way,
 To the branches of the forest,
 Where a wounded cowboy lay
 Neath the shade of a palmetto
 And beneath the sultry sky,
 Far away from his loved old Texas
 They laid him down to die.

His comrades gathered round him

To hear what he might say,
 And the tears rolled down each manly cheek
 As his life-blood ebbed away.
 One loved friend and companion
 Was kneeling by his side
 Trying to stop the life-blood flowing,
 But alas, in vain he tried.

In sum, parlor ballads, like the parlor songs in general that entered folk tradition, apparently exemplify bourgeois sensibility, worldview, ethic, and taste.

We must remember that, like all folklore, folksongs were constantly being adapted by those who sang them to their children, their playmates, their neighbors, their comrades-inarms, and so forth in the course of everyday life. Thus, a song may have followed chiefly ballad conventions in one enactment, chiefly lyric in another. The models, in short, are not mutually exclusive straitjackets; indeed, most songs invariably draw upon not just one way, but two and even more ways, of articulating their topics, even though one way will generally predominate. It is that quality of variability more than any other that has consistently stimulated scholarly interest in folksong.

Folktale

A fictional narrative varied in length and rich in symbolic and metaphorical meaning, oral in origin but now found more often in printed collections. The term “folktale” is often used loosely to describe all forms of traditional narratives, from brief jokes and anecdotes to lengthy adventure tales. Here the term applies only to the more complex narratives, the wondertales (*Märchen*), of European origin that were brought from Europe to the New World in oral and printed form by successive waves of settlers. This kind of story is popularly known as a fairy tale, though this is not an accurate description of its content or significance.

The broader definition of folktale is more current in Europe, where comparable terms refer to oral fictitious stories in general. In the New World, the generic use of “folktale” is often not appropriate; hence, the narrower definition is more useful. For example, “folktale” is not a suitable description of aboriginal narratives, many of which are more appropriately viewed as sacred or historical legends.

Folktales are filled with fantastic creatures, events and objects, but their main characters are ordinary people (lazy Jack, clever Polly, common farmers, among others) who are the recipients of wondrous bean trees, cups that never empty, or the granting of three wishes. Such tales have been regarded either as escapist fantasies that take one out of reality, or as profound metaphors that carry one deeper into an inner reality. There is continuing controversy over their suitability for children, given their fantastic nature as well as the violence often a part of these tales. It should be noted that while fairy tales now appear mostly in books intended for children, the original oral tales were and are more often directed to adult listeners, though children were not necessarily excluded.

Many of these stories still exist orally in the United States (notably in regions of the South) and in Canada (in Quebec and the Maritime Provinces). These regions were among the first colonized and farmed by Europeans and their descendants in the 17th and 18th centuries. Many early settlers were from England, Scotland, Ireland, and France; hence, folktales from the British Isles and France exist to this day in these older rural regions of both the United States and Canada, though much diminished. In later decades, settlers from other parts of Europe, and from non-European areas as well, added their own wealth of oral narratives to the growing treasury of New World folktales. Changes in social and economical environments and the loss of original languages have taken a heavy toll on folktales in the New World, but they persist.

Folktales arise in an oral tradition; thus, one cannot identify original or authoritative texts. There are as many texts of any particular folktale as there are people who have told it over many generations. Widespread stories like “Cinderella” and “Beauty and the Beast,” for example, have countless variants, each as original and authoritative as any other, although the aesthetic quality of a text also depends on the artistry of the individual teller. This rich variety is reflected in the titles of contemporary folktales from five different North American collections. “Beauty and the Beast,” one of the most widely collected tales, has eighteen separate titles, including “Bully Bornes,” “The Pretty Girl

and Her Lost Children,” and “White Bear Whittington.” Even more popular is the clever and often lazy young man known as “Jack” or “Little Jack” in English-speaking tradition and “Ti-Jean” in French tradition, the protagonists of stories still told in the 1990s. Despite the wealth of such stories, modern reworkings of folktales still focus on popular European tales instead of New World counterparts such as the Kentucky variant of “Cinderella,” called “The Girl Who Could Do Any Job of Work.”

Each folktale has an author, since active tellers reframe stories from their own experiences. Unfortunately, some collectors failed to include the names of those who told the stories, which gave rise to the notion that folktales were anonymous, communal creations. This is an inaccurate reflection of the skill and sophistication of excellent narrators, the best of whom are comparable to authors of written literature. Even in the New World, where storytelling traditions often did not survive the passage across the ocean and the hard life that followed, there are still a number of skilled traditional narrators with a rich legacy of folktales handed down in family and community settings. The Hicks and Ward families from North Carolina, for example, have kept alive tales from their ancestor Council Harmon (1807–1896). Many of these family stories were collected and then rewritten by popularizer Richard Chase, who claimed them as his own property (cf. Chase 1943, 1948). Other North American collectors have been more careful in crediting the individual tale-tellers themselves.

Collections of New World folktales, unlike those of Europe, date from the middle decades of the 20th century. European collectors were initially inspired by the works of the Grimm brothers in Germany in the early 19th century, a time when the United States was still a young nation and Canada was not yet a unified country. Thus, the nationalism that fueled European collecting found different expression in the New World; regional, ethnic, and racial considerations were more significant motivators in North American collecting.

There was a resurgence of interest in folktales in libraries and schools in the early part of the 20th century, drawing largely on the stories of Charles Perrault, the Grimm brothers, and Hans Christian Andersen. The more recent rekindling of interest in the early 1970s grew from this earlier book-oriented tradition but has blossomed to include stories from oral, printed, and electronic media. This new form of storytelling parallels, but does not arise from, the older oral tradition. Each has unique social and communal needs, aesthetic patterns, and performance contexts. The older oral storytelling usually exists in small family and community groups already familiar with both tellers and tales, and this tradition rests firmly on oral tales brought from Europe by their ancestors. The newer storytellers, still reliant largely on written tradition, are individual artists generally independent of a particular community; many perform for large audiences not directly connected with the tellers or their tales.

Folkways

Habitual actions, such as manners, customs, usages, and mores. An expanded sense of the term includes values and meanings in an attempt to describe the complex interlocking parts of a cultural system. Folkways might best be thought of as cultural artifacts, actions that due to their repeatability have the stability of objects. An example might be as simple as the custom in the United States of shaking hands when first greeting someone; the same encounter in France would require the mutual kissing of both cheeks.

Folkways as a term first appeared in 1906 with the publication of American sociologist William Graham Sumner's book of the same name (Sumner [1906] 1960). The term has remained in circulation mostly among historians and sociologists, especially those who work within the American context, having never really attracted much attention from folklorists. Folkways research is most often focused at the national or regional level and often emphasizes instances of ethnocentrism, the belief that one's own practices are right and natural and those of another culture are wrong or illogical. The anthropologist Edward Hall's many books focus on just such issues.

Sumner conceived of folkways as being the result of instincts becoming customary: Basic drives for food or shelter come to be satisfied in particular ways accepted by the group.

Children or other novices learn mostly through imitation and less often through instruction. Even in instruction, however, the reasons for a particular action remain largely unknown to both teacher and pupil. In some sense, folkways challenge conventional understandings of meaning

as explicit; the meaning of habitual actions is in the actions themselves, repeated through space and time. If asked, most people will not be able to tell why they cross themselves whenever they pass a cemetery, yet the action in itself has significance—it gives comfort, connects the individual with a particular perspective on death, and/or pays respect to the dead.

An enumeration of things that could be considered as folkways includes: (1) speech: conventions of writing or speaking as well as pronunciation, vocabulary, syntax, grammar, and inflection (such as the different forms of the second-person plural in the United States, including “you guys,” “y’all,” “You ‘uns,” and the like; (2) housing: what kind of homes people build as well as how they live in them; (3) family: parenting responsibilities, marriage customs, and social relations between family members; and (4) food: what people eat and how they eat it, special feasting or fasting occasions (note the term “foodways”). The list could be much longer, and it could include folkways of sex, religion, magic, dress, sports, work, and more. Readers examining particular studies would find that they only augment this list.

Folkways should not be taken as standing in opposition to modernity, as habits of limited use and practiced unconsciously. As some scholars have made clear, the more advanced a society becomes in material terms, the stronger its folkways become, concretized in technologies and sometimes required by institutions (Fischer 1989:10). For example, the fondness of Cajuns for such foods as crawfish is only redoubled by the establishing of modern crawfish-farming methods.

Folkways Records

Recording company founded by Moses Asch and Marian Distler in 1949, the third record company Asch had started. The earlier Asch and Disc labels had ended in bankruptcy, but Folkways was a success by almost any standard. Between 1949 and 1986, Asch issued more than 2,000 LP titles on the Folkways label (the early 78-rpm albums were all reissued on LP). Folkways was a key participant in the folk-music revival from the 1940s on, and it published many tides recorded, compiled, or annotated by folklorists, ethnomusicologists, and anthropologists.

The record business has always been dominated by a few major recording companies with their own distribution systems. National in scope and corporate in organization, they usually left the smaller niche markets to smaller companies until those markets proved profitable enough to invest in. The small companies used other forms of distribution and sold to targeted audiences. Folkways was one such relatively small company. Its market consisted largely of libraries and the urban middle class; its editorial policy was the opposite of corporate—based on the vision of a remarkable individual, Moses Asch, and a group of collaborators who advised him. Raised in an international, politically-active, urbane, literary home, Asch created a company that was international in scope, included hundreds of albums of literature, and captured the intense creativity of the diverse musical, literary, and political activities of his times.

Several key features distinguished Folkways Records from most other niche-market record companies. First, Folkways did not specialize in any given genre or ethnic group: its recordings ranged from the last chanters in Tierra del Fuego to African polyphony, Appalachian fiddle players, rural blues singers, American Indian chanters, John Cage and electronic music, and a large number of children's artists. The Folkways catalog included hundreds of spoken-word albums in dozens of languages, natural sounds, and documentaries of current events from the McCarthy era to Watergate, with a strong series on the civil rights movement. Second, every Folkways record had some kind of pamphlet inserted in the jacket. These notes varied from a few sheets with song lyrics to fifty or more tightly printed pages with extensive descriptions of context and style. This format was ideally suited for bringing unfamiliar material before the public, as well as for schools and libraries. Third, once a record was published, it was not deleted from the catalog. This was extremely rare in an industry that traditionally focused on hits and deleted slow-selling items without compunction. Asch not only kept Folkways records in print, he sometimes published recordings that the major labels had not kept in print in order to bring the music of earlier periods to a new audience—as in the famous *Anthology of American Folk Music* (1952) compiled by Harry Smith, which influenced many folk-revival musicians, folklorists, and others.

Moses Asch was ahead of his times in his interest in wedding print, visual media, and sound into a single package—which today would be labeled “multimedia.” He was a partner in Oak Publications, which published songbooks of many Folkways artists. He was involved with *SingOut!* magazine in the early years. Some of his “liner notes”

became separate books—as in his instruction albums. At one time he called his operation “Record, Book, and Film Sales.”

Folkways published recordings that other companies would not touch for political, economic, or other reasons. Throughout the 1950s and 1960s, Folkways published blacklisted performers—among them Pete Seeger, with fifty-four albums on Folkways—and the only known recordings of Jose Miguels, a Communist Portuguese poet living in exile. Folkways would publish recordings for which sales projections were minimal partly because Asch wanted to represent the whole world, and partly because he estimated that no matter what the recording, he could sell about 400 copies. If he kept the costs low enough (and he was well known for doing so), he could publish almost anything. This was one reason he published so many field recordings—they were inexpensive to produce, and they were recordings of music made in a more natural context than that of a recording studio.

During the 1960s, the success of the folk-music revival

turned a niche market into a hit market. This brought both the major companies and new independent record labels into the field. With their larger royalties and wider distribution, they attracted many artists who earlier might have published on Folkways. In the 1970s and 1980s, a similar process occurred with music from other parts of the world (“Worldbeat”). Folkways survived as a label characterized by field recordings and largely supported by its sales of recordings for children.

Although some Folkways titles are more enduring than others, the Folkways Records catalog came to include a vast number of highly significant recordings. Largely through the efforts of Ralph Rinzler, Folkways Records was acquired by the Smithsonian Institution, which committed itself to keeping all of the recordings in print, in 1987. In addition to the master tapes and associated rights, the Smithsonian acquired the business papers and files of the company. The collection is housed in the Smithsonian's Center for Folklife Programs and Cultural Studies, which archives the papers, maintains the entire collection in print on cassette, and started Smithsonian/Folkways Recordings in 1988 to reissue selected Folkways titles as well as new projects. The center subsequently acquired two other small record labels, Cook and Paredon. A free catalog of Folkways recordings, as well as those of Cook and Paredon, may be obtained by writing the Center.

Foodways

The intersection of food and culture. Foodways entered the stream of American folklore studies during the 1880s—the decade that saw the founding of the American Folklore Society and the holding of the Cotton Centennial Exposition. The development of foodways as a subdiscipline of folklore has retained the stamp of identity placed upon the discipline by the odd circumstances of its origin. Briefly recounted, these circumstances revolve around Lafcadio Hearn, a struggling journalist and traveler, who in 1879 sought to supplement a meager writing income by opening a small restaurant in New Orleans, which he advertised as “the cheapest eating house in the South.” The restaurant closed in short order, Hearn's silent partner and cook taking off with the little cash Hearn had raised to open its doors.

In order to pay the debts incurred by this failed venture, Hearn turned to William Coleman, a friend and bookshop proprietor. Hearn pitched Coleman on the idea of publishing several small books on New Orleans life and tradition to be sold to visitors expected at the Cotton Centennial Exposition, an event of World's Fair scale planned for New Orleans in 1884. Hearn was chiefly looking for an opportunity to publish a collection of proverbs, the fruit of his ongoing, self-guided explorations of New Orleans' Creole culture. Coleman agreed to publish the proverbs, but only if Hearn agreed to write an additional collection of Creole recipes. Misfortune continued to plague Hearn's ventures, as printing delays prevented the books from reaching bookstores until 1885, by which time the exposition and its thousands of tourists had left town. The two books—*Gombo Zhebes* and *La Cuisine*

Creole—were published to poor sales and reviews.

La Cuisine Creole met its author's claim as the only work in print that described the methods of New Orleans' Creole cooks. But for folklorists and others who, in the decades to follow its publication, were to value detailed, firsthand accounts of traditional expression, particularly among America's racial minorities, *La Cuisine Creole* came to represent the tangible, visible part of an otherwise invisible world, mixing African, Caribbean, and European cultures. *La Cuisine Creole* clarified Hearn's sketches of street life, transcriptions of street vendors' cries, and collected proverbs.

However, Hearn's choice of food as the expressive "medium" through which to communicate the cultural "message" of Creole tradition served over time to distance this body of work from his other ethnographic writings. Even as Hearn's stature as an ethnographer rose among American folklorists, the medium of foodways, which had proven so successful in his depiction of Creole life, failed to find the same scholarly acceptance as custom, music, dance, or verbal folk genres.

In 1884 the term "foodways" was not in English currency. A stowaway among European folk-cultural concepts that made their way into American scholarly usage a half-century later, "foodways" owes its intellectual identity to "folklife." The efforts of American folklorists such as Don Yoder and Warren Roberts to broaden the range of genres touched by tradition was at first largely perceived as a modest correctiv an attempt to change folklore's rules of evidence by adding material culture to the verbal and customary expressions that formed the academic canon at the time. While folk craft, folk architecture, folk costume, and other material genres did gain a heightened degree of professional respect as the result of the folklife movement, foodways gained the most, and for reasons that had more to do with imported ethnology than with food. The European theoretical emphasis upon "common" culture—the ordinary structures of everyday life—found in foodways a bridge to American folklore studies and an opportunity to contribute to those intellectual trends in postwar America that sought to widen the category of people considered "folk."

Interestingly, the demand for a culture-based understanding of food within the social sciences had been articulated in America far more eloquently and forcefully than in Europe, largely due to the efforts of Margaret Mead and her colleagues at the National Research Council's Committee on Food Habits. In the late 1930s and early 1940s, Mead worked with a large contingent of anthropologists, home economists, sociologists, and nutritionists to develop profiles of cultural food preferences. The strongest of these preferences, called "food habits," became the data upon which statistical projections of required foodstuffs and the hypothetical effects of wartime rationing could be calculated. The data proved more hypothetical than the theories that prompted its collection, but Mead succeeded in demonstrating the utility of applied anthropology and the close association among foodways, cultural identity, and community.

In the late 1970s, foodways also proved to be the vessel for a revised model of tradition in culture that combined two emergent concepts unrelated to any particular genre: first, an expanded notion of "context," and, second, increased attention upon folk expression as "symbol making." Unlike other genres, foodways were seldom anonymous: The intentions of a person producing food to eat and the expectations of the people consuming it were either evident or easily documented. Field research that focused upon foodways was as likely to plumb the cultural significance of the names of foods as to document the tools or techniques used to prepare it. Similarly, what folk informants identified as traditional about a food could range from the occasion for which it was prepared, to the origin of special ingredients, to customs that invested food with luck.

As a consequence, almost as soon as foodways came to be recognized within the enterprise of folklore, the new genre branched out in nearly as many directions as there were researchers. Not surprisingly, the patterns of this new work reflect accepted folkloristic approaches to identity and community: age, ethnicity, gender, locale,

occupation, religion. In an inclusive discipline, foodways became the most inclusive and least-disciplined genre.

In this regard, at least, foodways research enjoys the benefits of a broad definition and suffers few of the negative consequences. The term “foodways” has come to mean the intersection of food and culture. Lines of research, analysis, comparison, or theory that approach this intersection or pro

ceed from it are generally viewed with equal acceptance. There is no mission for foodways research—no priority list of work to be done and no palpable displeasure about the absence of one. In some respects, it has been of benefit to foodways as an emerging discipline that no single sector of the broad subject has come to dominate discussion: The production of foodstuffs, patterns of marketing and processing, cookery, the sale of foods in commercial venues, and even the customs and manners associated with eating have garnered equivalent scholarly attention.

What have emerged as defining characteristics of American foodways research are, first, a serious tone of voice, and, second, high regard for imaginative description. The first of these characteristics distinguishes foodways scholarship from the voluminous output of popular and promotional writings about food that flood the nation's book racks, magazines, and newspapers. The second is, ironically, a recognition that good writing about food and culture turns up frequently in virtually every corner of the literary marketplace.

One useful way of surveying the work that contemporary scholars have brought to the study of American foodways is to examine what this body of work contributes to folklore's preoccupation with community.

Food and Age. With the exception of oral-history work, foodways research is less likely to focus upon the food-related customs or behavior of a single age group. Foodways pays respect to community elders—from the matriarch who presides over Thanksgiving dinner to the sage Lake Erie fisherman whose skills in spotting fish suggest a third eye—but probably less so than other disciplines. When cooking or eating is involved, the attention is more likely to be focused upon household members personally involved in these enterprises, and less likely to focus upon people either too young or too old to actively participate.

Food and Ethnicity. Foodways has been identified as ethnicity of last resort—the last bit of ethnic difference to be shed in America's rush to assimilation. One might expect this view to attract greater numbers of scholars interested in the display of ethnicity, but the opposite is more nearly true. The loss of singing, craft, costume, and other traditions seems more acute when “all” that is left is an occasional meal that conjures the preimmigrant past. Nonetheless, foodways is probably the most available, quantifiable, and comparable information offered to today's students of ethnic community.

Food and Gender. Unlike other subdisciplines, which have seen new research into gender-based roles, styles, and notions of tradition, American foodways scholarship has paid little attention to the ways in which foodways represent gender. Folklorist Thomas Adler's useful speculations on sexual provinces in cookery and meal schedule are a noteworthy exception (cf. Adler [1981] 1983), but they have not inspired further inquiry. The constant reinforcement of popular stereotypes depicting farmers as men, cooks as women, and eaters as families may discourage a closer examination of the varied activities associated with foodways and a more particular look at who does what—and why.

Food and Locale. “Regional foodways” represents the consummation of the long-sought marriage of folklore and geography, and the demonstration of functionalist theories about how culture conserves nature. In theory, at least, it follows (in a backwards sort of way) that if people are what they eat, and they eat where they are, they are where they are. An Iowa farm family sitting down to a groaning table of vegetables, fresh from the garden, and home-cured ham; a warming Maine chowder, simmered from the day's catch; Maryland crab cakes; Boston baked beans; a Rhode Island clambake; Texas chili—each of these images conjures a connection between a place, its native foodstuffs, local styles of cookery, and—in some cases—social events that encapsulate several of these elements.

As vernacular culture, the stuff of images and advertisements, this notion of regional foodways is demonstrably “authentic.” There are more pictures of dancing red crabs on restaurant marquees in Baltimore than in Phoenix; more log cabin-lettered roadside billboards advertising barbecue in the Blue Ridge than in the Catskills. But while these culinary animations do proscribe regions in a somewhat coherent way, their coherence does not derive from agriculture, horticulture, or aquaculture. Worse, these images often conceal shifts in what people are actually growing, cooking, and eating.

Food and Occupation. Some of the best folklore research on occupational traditions belongs under the broad rubric of “foodways” but predates the folklife movement.

Folklorists' attention to fishermen, farmers, and cowboys begins before the turn of the century and has been nourished by continued interest in customs, beliefs, worksongs, and stories that configure the worker, the worker's peers, a job, and the dangers that bind them. As the notions of occupation and occupational folklore have diversified, the appeal of these few occupations has remained strong to scholars. Integrating research about them into foodways studies requires little more than recognition of the appetites and market forces that have historically driven these occupations, and willingness (not yet in evidence) to apply the high standards of prior research to other food-related occupations.

Food and Religion. The range of associations between food and religion is extensive—from dietary rules that limit what a member of a particular faith may eat, to the symbolic connection between nutritional and spiritual sustenance, to the frequent use of food events such as church suppers and bake sales as fund-raisers and social events benefiting religious groups. Religious communities are seldom formed *because* of their attitudes toward foods, but they may come to be known by, and differentiated from, other communities as a consequence of food-related beliefs, rituals, or other practices. Such is certainly true for Jewish kosher-food practices, Muslim dietary laws, and Catholic abstention from meat on Fridays—the source of the derogations “fisheater” or “mackerel snapper.”

More than anything else, American foodways are characterized by the marketplace—a plethora of choices and patterns of consumption that respond to impulse, trend, season, or times. Such whimsy leads many folklorists to look past much of consumer behavior in search of those aspects of foodrelated culture more deeply rooted in the kinds of communities listed above, or elsewhere. Table manners seem to survive passing fashions that affect the foods being eaten. The foods prepared for special occasions—birthday dinners, Thanksgiving, religious holidays, Fourth of July picnics, and such—also seem more resistant to change. But to invest too much importance in these seeming constants is to place too heavy a burden upon them for “carrying on” the broad legacies we assign them. Important food events have symbolic value because they are important in the first place, and many, if not all, of the participants are aware of what is symbolically being “said” when a Thanksgiving turkey is carved or birthday-cake candles are blown out.

The seriousness that anthropologists brought in the late 1930s and early 1940s to the study of food habits offers an indication of key questions American foodways research must tackle. What does the term “food habit” mean in a consumerist society? Where is significance located in the twisted trail from field to table? Tradition is no less active in decision making about what seed to plant in a suburban backyard garden or the choice of a pizza venue. The study of American foodways holds the promise of offering an approach to folklife in its broadest sense and widest reference—a scholarly enterprise that locates significance in common experience and cultural variety.

Fortier, Alcée (1856–1914)

Collector of Louisiana French folklore. Born in St. James Parish, Louisiana, son of a sugar planter, Fortier was a member of a prominent Creole family. In 1884 he became professor of French at the University of Louisiana, which later became Tulane University, and he spent his academic career there. He was an important figure in New Orleans educational and intellectual circles, and a school, a park, and a street in the city are named after him.

His own French heritage and devotion to French culture influenced his interest in collecting folklore, though he had other scholarly interests. His principal contribution to folklore is his book *Louisiana Folk-Tales* (1895), the second volume published in the American Folklore Society's Memoir Series. The tales it contains were collected by Fortier and two of his nieces from Creole-speaking African Americans, and they were published in both English and French. He also published an article on customs and superstitions in the first volume of the *Journal of American Folklore*, drawn mostly from his childhood memories of African American life on his family plantation, and he made a field trip to the Acadian country in 1890.

Fortier was a talented organizer who in 1892 established the Louisiana Association of the American Folklore Society, one of several branches of the national society and the only one located in the South. For several years, this organization played a role in the cultural life of New Orleans, and a number of prominent educators, writers, and community leaders were members who collected and discussed folklore. Fortier was also active in the national society, becoming its president in 1894.

Foxfire

Magazine and educational project. In 1966 Eliot Wigginton began teaching ninth- and tenth-grade English at the Rabun Gap-Nacoochee School, a private religiously oriented institution in the Appalachian Mountains of northwestern Georgia. His failure to interest students in the conventional curriculum encouraged him to seek new pedagogical methods. Publishing a magazine appealed to the students, who determined that at least part of its subject matter would involve the region's folkways, particularly those that

seemed to be in danger of disappearing. Consequently, the first issue of *Foxfire*, which appeared in 1967 and sold out of two 600-copy printings, supplemented the standard fare of student-published literary magazines with material on local folk beliefs and traditional remedies. These were illustrated with photographs and drawings, the entire production being the work of students under Wigginton's direction.

The local reception of the first issue of *Foxfire* encouraged Wigginton and his students to plan a second. Gradually, short articles on such subjects as soap making, planting by the signs, butter churning, and ghost stories dominated the contents of the magazine, which within a year had become a quarterly. Special issues on topics such as the "old-time religion" and logcabin building also appeared. Several other special issues of *Foxfire* have surveyed the history and culture of mountain communities near Rabun Gap. Publicity by the local and state press, as well as awards from state education associations, resulted in notices in national newspapers and magazines, and by 1970 *Foxfire* had achieved considerable recognition. Wigginton emphasized student involvement in every stage of the magazine's production and distribution: researching (usually through interviews) and writing the articles, editing, developing layouts, soliciting subscribers, and determining costs, for example.

In 1972 Wigginton edited the first anthology of material from *Foxfire*. The commercial success of *The Foxfire Book* (with more than two million copies sold) contributed to public awareness of the magazine and helped ensure the financial stability of the Southern Highlands Literary Fund (later the Foxfire Fund), the organizational base that Wigginton had developed for his project. Moreover, *Foxfire's* reputation attracted the attention of the Washington-based Institutional Development and Economic Affairs Service (IDEAS), which sought funding to encourage other schools from around the country to undertake similar programs that allowed highschool students to write pieces, usually based on interviews with family members and neighbors, about local history and folklore. The first *Foxfire*-inspired magazine started under the auspices of IDEAS was *Hoyekiya*, published by Lakota students on the Pine Ridge Reservation in South Dakota. Other projects that have imitated *Foxfire* include *Loblolly* (Gary, Texas), *Salt* (Kennebunkport, Maine), and *Nanih Wayah* (Neshoba County, Mississippi), all of which emphasized regional culture. In terms of visibility, among the most successful of *Foxfire's* imitators has been *Bittersweet*, begun in 1973 by Ellen Gray Massey in Lebanon, Missouri. Two anthologies of material from this Ozark-oriented student magazine have been published (cf. Massey 1978).

The successes of *Foxfire* and *The Foxfire Book* have also generated a considerable publishing phenomenon. By the mid-1990s, the original anthology had been followed by nine other collections of material originally published in the magazine, most edited by Wigginton; a cookbook featuring Appalachian foodways; a volume on Christmas customs; a book on toys and games from the region; a biographical study of Aunt Arie Carpenter, one of the principal sources from whom Wigginton's early students collected their information on Appalachian folkways; and several books by Wigginton detailing his pedagogical philosophy and methodology (Wigginton 1975, 1985). Some of these were originally published locally by the Foxfire Press and reprinted by national presses. For a time, *Foxfire* had its own record label, and the Foxfire String Band, comprised of student musicians, appeared on the Grand Ole Opry and at the Knoxville, Tennessee, World's Fair. Moreover, *Foxfire* has inspired a play of the same name written by fantasy novelist

Susan Mary Cooper and actor Hume Cronyn. The play opened in New York City in 1983 with Cronyn and Jessica Tandy heading the cast.

Since becoming aware of Wigginton's project, academic folklorists have had mixed feelings about *Foxfire*. On one hand, many have recognized that having high-school students collect folklore provides rich possibilities both for the students, who thereby have the opportunity to learn more about their own heritages, and for the study of folklore, which may benefit from

the data so collected. Wigginton's students, for instance, have documented the material culture of their community, a complement to the record of folksong and folk narrative that folklore collectors have been making in the Appalachians for almost a century. Moreover, the positive reputation of *Foxfire* has contributed to an educational climate to

which folklorists involved in public-sector work have responded. For example, programs funded in part by local, state, and federal arts councils, whose support may have been easier to obtain because of the publicity surrounding *Foxfire*, have brought tradition bearers into classrooms to demonstrate their skills.

At the same time, though, many folklorists deplored the antiquarian emphasis in *Foxfire*, which seems to equate folklore exclusively with a way of life that is growing increasingly obsolete. Though Wigginton's students often did not even use the term "folklore" to refer to what they were gathering from their neighbors, reviewers of the magazine and the anthologies have usually identified the publications' contents as folklore, thus reinforcing one popular view of the term's meaning. Folklorists have also criticized the nostalgic romanticism in the methods and presentation of the material in *Foxfire*, a tone derived in part from Wigginton's unfamiliarity with the formal study of the subject. To his credit, Wigginton responded to the criticisms of folklorists by attempting to involve them in his work. Richard M. Dorson, for example, wrote an afterword for *Foxfire 4*, which came out in 1977, and folklorists such as Edward D. Ives, Joseph Hickerson, and Ralph Rinzler have served on the magazine's advisory board. George Reynolds, who had taken a master's degree in folk studies at Western Kentucky University, joined Wigginton's staff in 1976. Respondents to critics of *Foxfire* have also stressed that the project's intention has been to employ cultural journalism to teach basic communications skills, not to teach folklore research methods.

Franklin, Benjamin (1706–1790)

Statesman, scientist, inventor, publisher, and author. His untiring energy and keen mind made Franklin one of the most influential members of 18th-century America. In addition to his numerous diplomatic and entrepreneurial accomplishments, he also was much interested in his average fellow citizens. It was for them that he published his instructive and entertaining almanac for twenty-five years from 1733 to 1758. His sense of humor, his practical advice, and his pragmatic worldview made these annual publications of twenty-four to thirty-six pages a major success. Under the pseudonym of Richard Saunders, the *Poor Richard's Almanack* was published in editions of more than 10,000 copies each year, setting new standards for the moralistic, pragmatic, and entertaining content of similar publications.

While Franklin included short folk narratives, weather superstitions, and various other folkloric texts, he was primarily interested in providing his compatriots with proverbial wisdom. Contrary to popular belief, he coined hardly any new proverbs but copied them from major English proverb collections. Of greatest influence was his essay titled "The Way to Wealth" that appeared in the last almanac, of 1758 (cf. Gallacher 1949). This short essay contains 105 proverbs culled from the previous issues of the almanac, and the wisdom contained in them became the proverbial philosophy of virtue, prosperity, prudence, and, above all, economic common sense that guided the population of this young nation. These five proverbs appear to be his own: "Three removes is as bad as a fire," "Laziness travels so slowly, that poverty soon overtakes him," "Sloth makes all things difficult, but industry all easy," "Industry pays debts, while despair increases them," and "There will be sleeping enough in the grave." The name of Benjamin Franklin or at least the popular pseudonym "Poor Richard" became attached to many traditional folk proverbs. While Franklin originated few new proverbs, he deserves much credit in popularizing old proverbs as pragmatic American wisdom.

French Canadians

Immigrants and their descendants from France—*Canadiens*. North America was discovered by the Venetian John Cabot in 1497, sailing for Henry VII of England. In 1534 Jacques Cartier began the first of three voyages of discovery on behalf of François I of France, but it was not until 1604 that the first serious attempt was made to implant French settlers in the New World. Port-Royal, in Acadia, was founded in 1604–1605; the future city of Quebec, by Samuel de Champlain in 1608.

Colonization was slow at first; in 1671 there were no more than 500 colonists in Acadia, 300 of these at Port-Royal, on the Bay of Fundy. By 1663 there were 3,000 settlers in the three centers of Montreal, Quebec, and Three Rivers, along the St. Lawrence River. The two colonies were separated by a considerable distance and were administratively distinct. The distinction was enhanced by the origins in France of the settlers; the majority of French Canadians had come from the Ilede-France, Normandy, and nearby provinces; most Acadians came from the center-west provinces of Saintonge, Aunis, and Poitou. The French spoken in Quebec is quite distinct from that of the Acadians of Canada's Atlantic Provinces (Nova Scotia, New Brunswick, Prince Edward Island, and Newfoundland).

Wars between France and England led first to the loss of Acadia, definitively ceded to England by the Treaty of Utrecht in 1713, and then to the loss of New France as a result of the Seven Years War, sealed by the Treaty of Paris in 1763. When that war broke out in 1756, there were no more than 64,000 settlers in New France, compared to the million or so in the English colonies. Yet in the 150 years or so of French colonization, *voyageurs* (canoe men) and *coureurs de bois* (woods runners) had opened up the land west of the English colonies, explored the Mississippi, established numerous posts, including New Orleans in 1718, and laid claim to the vast western lands known collectively as Louisiana.

From 1763 until the 1960s, the survival of French culture in Canada was greatly influenced by the Catholic Church, whose priests defended their flocks against cultural attack by the English in whatever province they might be. French Canadian *voyageurs* and *coureurs de bois* had been to the fore in opening up the West, pushing ever forward from the earliest decades of the 18th century, so that by the end of the 19th century important French communities were found in northern Ontario, in Manitoba and Saskatchewan, and to a lesser extent in Alberta and British Columbia. Their presence was felt, too, in many American states of the Midwest and Far West.

Apart from the Atlantic Provinces of Canada and along the Lower St. Lawrence River, where the fishery naturally remained a dominant aspect of culture, farming was always a central activity of French Canadians, supplemented by work in the lumber woods, still a major industry in eastern Canada. The Catholic Church was to maintain its influence in Quebec until the "Quiet Revolution" of the 1960s; it controlled education and influenced all areas of life. It was, however, an agent of conservatism, which perhaps explains in part why an intellectual elite did not begin to emerge in Canada until the middle of the 19th century; it also explains the force of oral tradition as a potent agent of cultural maintenance, and why, in most French Canadian settled areas of Canada, folklore in its many forms has remained a vibrant force in the social fabric.

An awareness of tradition as a unifying, cohesive factor of French Canadian civilization began to emerge only in the 1860s, with the writings of Joseph-Charles Taché and Philippe Aubert de Gaspé; they wrote with understanding and sensitivity about, in Taché's case, the life and legends of the lumbermen; in Aubert de Gaspé's, the seigneurial and peasant life in Quebec.

Their writings were, understandably enough, of a literary rather than an ethnographic bent, but they helped define the emerging sense of identity of the Quebecois *habitant* (settler). A further impulse in this direction was given by the publication of the first truly folkloristic work to appear in Quebec, Ernest Gagnon's *Chansons populaires du Canada* (1865). Gagnon was ahead of his time in that he noted the melodies of the 100 or so songs he wrote down, as well as information on his informants.

Gagnon's achievement was not to be followed up, however, for another fifty years or more, although he had brought to public attention what was to prove to be one of the richest folksong traditions in the French-speaking world.

Folk tradition was neglected very largely between Gagnon and the advent of Marius Barbeau on the folklore scene in Canada in 1914; apart from the occasional literary adaptations in family magazines of traditional materials, and the abortive Canadian branch of the American Folklore Society founded in Montreal by Honoré Beaugrand in 1892, the only work of note was by the American travel writer William Parker Greenough, whose *Canadian Folk-Life and Folk-Lore* (1897) is a remarkable survey of many aspects of peasant life of the period. Probably the first book published in North America to include the term "folk-life" in its title, the work is still worth reading for its sympathetic historical background, and its evocation of the customs, stories, songs, occupations, and character of the French Canadians.

Marius Barbeau (1883–1969) had an enormous impact on the organized collection and study of folklore in Canada, not only in the Francophone regions but also among Anglophone Canadians and native peoples. Attached to the National Museum of Canada in Ottawa, following a meeting with Franz Boas in 1913 Barbeau began a lifetime of collecting, in the course of which he not only amassed more than 7,000 French Canadian folksongs, but also influenced several generations of French Canadian scholars in folklore.

It was Barbeau who brought to the attention of folklorists the incredible richness of the French folk narrative tradition in Canada, publishing whole series of *Märchen* (fairy tales) in the pages of the *Journal of American Folklore*, of which he was an associate editor for many years. His interests were all-encompassing, however, as his more than 600 articles and books, in both French and English, attest. He explored and documented such diverse aspects of folk culture as clothing, foodways, housing, furniture, weapons, domestic utensils, games, formulas, customs and beliefs, and folk art and imagery, in addition to his collections of folktales, legends, anecdotes, songs, and music; folksongs, however, were closest to his heart, and he published four major collections of them, in addition to numerous scholarly articles.

Most of his work was in his native province of Quebec, and it was there, either directly or indirectly, that he set the course of future research in French Canadian folklore. His foremost disciple was Luc Lacourcière (1910–1989), who began teaching folklore at Laval University in 1944 and organized the Archives de Folklore there. Lacourcière collected extensively in Quebec and New Brunswick, his chief interest being

in folktales; his goal was to publish a definitive catalog of French folktales found in North America, and, while largely complete, it remained unpublished at his death.

Lacourcière's main influence was through his teaching; he supervised several generations of Quebec folklorists in their research and influenced many more Francophone scholars, Acadians and Franco-Americans alike. The Publications of the Archives de Folklore Series, which he edited, remains a major contribution to the readily available folklore documentation of Quebec; it has a preponderance of works, usually theses or dissertations in origin, dealing with aspects of folk narrative, although six of the twenty-five volumes to have appeared by 1991 formed the bulk of Conrad Laforte's massive *Catalog de la Chanson folklorique française*, a work attempting to impose a logical order on the whole corpus of French folksong from around the world.

Though song and narrative were Lacourcière's main concerns, like Barbeau his interests extended beyond oral folklore; one of his students, Jean-Claude Dupont, who was to succeed him at the head of folklore studies at Laval, has devoted much of his professional career to the study of the material culture of Quebec life and was responsible for giving a new emphasis to folklore studies at Laval. While scholarly and popular works on French folktales continued to appear—notably a series edited by Lacourcière's student Jean-Pierre Pichette, begun in 1978—Dupont instituted in 1981 a new series at Laval called *Ethnologie de l'Amérique française*, under the aegis of the newly formed CELAT (*Centre d'études sur la langue, les arts et les traditions populaires des francophones en Amérique du Nord*); this series was broader in scope than that of the Archives de Folklore, including volumes on leather-working traditions, traditional religious iconography, domestic heating, dance, forestry and woodworking, domestic and community life, vernacular architecture, and children's folklore, as well as volumes on aspects of the folksong and narrative traditions. Dupont's early research was in the art and technology of the blacksmith.

The emphasis given to narrative by Lacourcière is nonetheless evident not only in the volumes that appeared in the Archives de Folklore Series, but also those edited by his student Jean-Pierre Pichette. Catherine Jolicoeur, Germain Lemieux, Hélène Bernier, Nancy Schmitz, and Jean-Pierre Pichette in the former series; Jean-Claude Dupont, Conrad Laforte, Clément Legaré, Bertrand Bergeron and Gérald Aucoin in the series *Mémoires d'Homme*—all have published collections of narratives even when, as is the case for Dupont and Laforte, their reputations were made in material culture and folksong, respectively.

Folksong studies have remained central to Laval-generated scholarship; works by Russell Scott Young, Dominique Gauthier, Conrad Laforte, Donald Deschênes, Charlotte Cormier, Madeleine Béland, and others testify to the longstanding influence of Marius Barbeau, quite apart from the intrinsic interest of the songs themselves. Besides material culture studies, areas such as custom and belief, foodways, folk speech, and other genres have been less well studied than narrative and song. As is often the case, some kinds of research are entirely dependant on the interests of one individual; thus for several years, Madeleine Doyon-Ferland was alone in the study of material culture, children's lore and games, and dance; latterly, Simone Voyer for dance, Jean Simard for folk art and religion, and Jean DuBerger in narrative and popular culture have broadened the scope of published research. In the Laval tradition, studies by these scholars have been chiefly comparative and historical in emphasis.

Mention should be made here that while Laval scholars have naturally been preoccupied with Francophone traditions, they have not totally eschewed non-Francophone traditions in Quebec; Nancy Schmitz's work among the Quebec Irish is a case in point. Acadian scholars, of course, have always been only too well aware of the realities of living in a bilingual culture; this was underlined by the Acadian Catherine Jolicoeur who, during her presidency of the Folklore Studies Association of Canada (*l'Association canadienne d'ethnologie et defolklore*), readily switched from one language to the other.

The fact that Canada is a bilingual nation has required cooperation between French and English scholars, if only for the necessary federal funding; such cooperation began formally in 1976 with the first volume of an annual journal entitled *Culture & Tradition* (the ampersand being bilingual), put together by students of the folklore programs at Laval and Memorial Universities. It was followed in 1979 by the organ of the national association, *Canadian Folklore canadien*, which generally includes an equal number of articles in French and English.

A scholar much influenced by Lacourcière was Robert Lionel Séguin (1920–1983), whose path diverged however from that of his illustrious colleague. As much as Lacourcière was a scholar of oral traditions, so Séguin was of material culture. With his base at the University of Quebec at Three Rivers, Séguin labored to produce a portrait of the whole of daily Quebecois life from the 17th through the 20th centuries, his writings dealing with topics as diverse as farm equipment in the 17th and 18th centuries, mills and barns, costume, entertainments, toys, witchcraft, utensils, swearing, work techniques, and customary life. Séguin also founded and edited the *Revue d'Ethnologie du Québec*. Beginning in 1975, the series included twelve issues before its demise in 1980. In his Introduction to Volume 1, Séguin stressed the growth of interest in Quebec in ethnohistoric research, suggesting it to be a logical path in the search for his people's identity.

This approach to the study of folklore has been the unifying thread of folklore studies in Quebec and, indeed, in French-speaking Canada as a whole. While it was not explicit in the writings of Barbeau and Lacourcière, at least not to the point of it becoming part of the French Canadian folklorist's credo, subsequent generations have certainly stressed more and more openly their interest in their traditional heritage as the key to their identity—as Quebecois, or Acadians, or FrancoOntarians, or French Newfoundlanders.

This was in part a consequence of the "Quiet Revolution" of the 1960s, which saw the rejection on the part of younger generations of many traditional values and institutions, and an assertion, within the larger Canadian context, of their distinctiveness. The more extreme adherents to this position took up the cause of Quebec nationalism and began pursuing the goal of a separate and independent Quebec state. Many turned to the study of folklore and ethnology to find the roots and nature of their cultural distinctiveness, and at Laval University, where folklore studies had been established since 1944, they found a ready-made resource. The general preoccupation with the past led ultimately to the absorption of folklore as a distinct discipline into the larger field of history; folklorists trained at Laval now take their degrees in history, with specialization in *Arts et Traditions populaires*.

Lacking the same unified political status as the province of Quebec, Acadians have not followed the same path. While by the mid-1990s they constituted up to 30 percent of the

population of New Brunswick, Acadians in Nova Scotia and Prince Edward Island have nowhere near the same substantial minority, with populations of Francophones below 10 per-cent. The Acadian element in Newfoundland, even when taken together with other groups of French speakers, constitutes less than 1 per cent of the province's population.

Here again the influence of, first, Marius Barbeau and then Luc Lacourcière was significant. The former had influenced the Acadian journalist Joseph-Thomas Leblanc, who used his newspaper, *L'Évangéline*, to collect 1,200 Acadian folksongs in the 1930s. Another pioneer collector of Acadian folklore was Anselme Chiasson who, with his cousin Br. Daniel Boudreau, published five modest but significant series of folksongs between 1942 and 1979; his 1961 study of the history and traditions of Cheticamp, in Cape Breton Island, his home community, was widely praised for its exploration of a hitherto little known Acadian enclave. Chiasson subsequently published a volume on the folklore of the Magdalen Islands in 1980, covering many aspects of the social, material, and spiritual life of the inhabitants.

Lacourcière's influence on Acadian folklore studies went back, in fact, to Chiasson's initial work in 1942; Chiasson was in touch with Marius Barbeau, and Barbeau had sought Lacourcière's advice on a problem raised by Chiasson. But Lacourcière's greatest influence was as a teacher, not only of Quebecois folklorists, but also of many of the major Acadian scholars from the 1950s onward. Indeed, Jean-Claude Dupont, the Quebec native who succeeded Lacourcière at Laval, taught at the University of Moncton before returning to Laval, his research there leading to two major studies of Acadian tradition (Dupont 1977, 1978a).

Well before Dupont's work in Acadia, Lacourcière had collected there, and drew to him the first academically trained Acadian folklorists—notably, Catherine Jolicoeur, whose 1963 dissertation supervised by Lacourcière, on Acadian phantom vessel legends, was subsequently published in the *Archives de Folklore Series* (Volume 11, 1970); Antonine Maillet, whose celebrity as an author has cloaked her studies in folklore, which have nonetheless informed her fictional writings; and Lauraine Léger, whose study of traditional sanctions in Kent County, New Brunswick, was a novel departure from the more common preoccupations with song, narrative or material culture.

The most significant development for Acadian culture was the creation, in 1963, of the Maritime Provinces' only Francophone university at Moncton, New Brunswick, and, more specifically still, the foundation of its *Centre d'études acadiennes* (Cea) in 1970. The Cea has been geared to the amassing of every available document in the world relative to the history of the Acadians, but from the start oral traditions were not neglected; important contributions from Anselme Chiasson, Charlotte Cormier, and Ronald Labelle (both taught by Lacourcière), as well as by collectors already named, have made of the Cea a major folklore archive of Acadian traditions. Labelle, a Quebec native, currently directs the center, but his training has been invaluable in instituting major research projects on oral history, foodways, and folk medicine, among others.

The leading Acadian folklorist in Prince Edward Island, Georges Arsenault, was also trained by Lacourcière. Besides an important volume on Acadian ballads published in 1980, he authored a unique study of Candlemas festivities on the island in 1982. Significant collections have also been made in Acadia by Vivian Labrie and Robert Bouthillier, chiefly of tales and songs; by Dominique Gauthier, of songs; by Marielle Boudreau and Melvin Gallant of foodways, by Gallant of tales; and, on Cape Breton

Island, by Gérald Aucoin of tales. The most important work to date on the Acadians of southern Nova Scotia remains Alain Doucet's little known study of the oral literature of the St. Mary's Bay region, published in 1965.

The handful of French villages on the coast of Newfoundland's Port-au-Port Peninsula represent a quite different set of historical circumstances than those pertaining to the Quebec or Acadian French. The original French settlers were, in the main, deserters from the 19th-century French fishery prosecuted on Newfoundland's West Coast, coming from Brittany, Normandy, and other maritime regions of France, as well as from St. Pierre and Miquelon, off Newfoundland's South Coast. Intermarrying with Acadians from Cape Breton Island who began settling nearby regions at the same period, the Portau-Port French, despite their infinitesimally small numbers (less than 3,000), have maintained a remarkably rich tradition of folktale, folksong, music, and other traditions in the face of constant pressures to assimilate to the dominant Anglophone majority. Their French culture is one of the few in eastern Canada not to have been explored in depth by Quebec scholars; work there has been based at Memorial University of Newfoundland, led by Gerald Thomas and a small number of his students. In light of his training, the differences of approach between French Canadian and Anglo Canadian folklorists is apparent in Thomas' 1983 study of the folktale tradition and Gary Butler's 1990 analysis of supernatural beliefs.

Ontario, traditionally considered the heartland of English Canada, nonetheless has a Francophone population of approximately 450,000, which makes it by far the largest such minority in any of the Canadian provinces and territories. Ontario is also the site of the national capital, Ottawa, where the National Museum of Canada (now the Canadian Museum of Civilization) is situated. The museum has always had a significant role to play in folklore studies in Canada, and the attention paid to French Canada, while less in the late 20th century than in the past, has been important.

It was Barbeau, who was attached to the National Museum, who launched research on French Canadian traditions on a systematic basis; apart from his own extensive collecting and publishing, he influenced many researchers in the first half of the 20th century and was a key figure in promoting Lacourcière's career at Laval. In addition, the museum provided support of various kinds for institutional and independent researchers, and has created a large and important archive. Major development of the Folklore Section was made by Barbeau's successor at the museum, Carmen Roy. A native of the Gaspé Peninsula, she is the author of the *Littérature orale en Gaspésie* (1955), which was derived from her 1953 doctoral dissertation from the Sorbonne in Paris and was a major survey of a region but little explored at the time. She also made a survey in 1966 of the French islands of St. Pierre and Miquelon, which has not received the recognition it deserves.

The one person who stands alone in the collection and publication of Franco-Ontarian folklore is Germain Lemieux, S.J. In the late 1940s and early 1950s, Lemieux was collecting local history and traditions for the *Société historique du Nouvel-Ontario*, and upon meeting Luc Lacourcière in 1950, he was little by little beguiled into pursuing graduate studies at Laval. There he completed both his M.A. and his Ph.D. degrees, his dissertation being the comparative analysis of an international tale type, versions of which he had collected in the French region of northern Ontario. His collecting continued with renewed vigor, and in 1972 his work *Les jongleurs du billochet*, which served as an

introduction to subsequent volumes of folktales, was published. Volume 1 of a proposed thirty appeared in 1973, as a publication of the Centre FrancoOntarien de folklore of the University of Sudbury. Volume 29 appeared in 1990. The series is quite remarkable, not only for the large number of tales included, but for Lemieux's effort to provide both a scholarly transcription of his texts and a more accessible standardized version following.

Much of Lemieux's work is being continued by the embryonic Folklore Department of the University of Sudbury, where Jean-Pierre Pichette, Lacourcières last doctoral student, has a program in place that emphasizes field collections. Its archive is an important addition to archives of French culture in Quebec and the Atlantic Provinces. Franco-Ontarians themselves are for the most part the descendants of 19th-century Quebec settlers, whose traditions they brought with them.

The present-day province of Manitoba was claimed for France as early as 1738; but even after the English conquest of French Canada in 1763, English commercial interests employed large numbers of French Canadians there. By the beginning of the 19th century, there were as many as 6,000 or 7,000 French Canadians implanted there, many of whom married native women, which facilitated the maintenance of peace in the region. There was a slow but continuous immigration of Quebec natives into the Red River area; by 1871, half of the population of what was to become St. Boniface, opposite Winnipeg, was described as *Métis* (those with a French father and an Indian mother). However, the Manitoba Act of 1870, which brought the province into the Canadian Confederation, also ushered in an influx of settlers from Ontario and a gradual decline of French rights.

The erosion of French culture in Manitoba has had numerous opponents from the days of Louis Riel and his abortive rebellion. Its chief defender in the late 20th century is the *Centre d'études franco-canadiennes de l'Ouest*, organized by Annette Saint-Pierre and Robert Painchaud in 1975. As its name implies, its concern is with French language and culture in all of the Western Provinces. Relatively few works of interest to folklorists have been published, for want of qualified scholars, with the notable exception of Marcien Ferland's *Chansons à répondre du Manitoba* (1979).

French Canadian folklore scholarship can be characterized in the following ways: First, as one would expect, it is most solidly based in Quebec, chiefly at Laval University; it has several subsidiary bases, both in Quebec and in the Atlantic provinces, chiefly at Moncton. The farther west one moves, the less well entrenched it is as a subject for academic study. Second, folklore is used by French Canadians as an important tool in the preservation of their cultural heritage, and in some circles as a justification or an illustration of their distinctive identity (and, therefore, of their right to political distinctiveness). Third, folklore studies have been largely historical and comparative in nature, in part because that approach was the dominant one everywhere until the 1960s, and in part because since the 1960s folklore has acquired the cultural-political function noted previously.

French in the United States

Immigrants and their descendants who came to the United States directly from France or indirectly through Canada or the West Indies. The history of the French in the United States is complicated by several factors: shifting political boundaries on the North American continent from the 17th through the 19th centuries, the mobility of different French-speaking populations, and their various degrees of acculturation and senses of identity. The study of French folklore and folklife in the United States is further complicated by the variety of sources available, ranging from romanticized local histories to scholarly histories and ethnographies of specific groups. French, French Canadian, Franco-American, and American researchers also have had distinctive theoretical perspectives on the French experience in America, although the 1994 retrospective conference “L’Ethnologie des Francophones en Amérique du Nord, 1944–1994: Bilan et Perspectives” at Laval University in Quebec City symbolizes a critical rapprochement.

This entry briefly traces French vernacular culture in the United States through folklife studies growing out of the initial exploration and settlement in 17th- and 18th-century New France; *Métis* culture; 19th-century French Canadian immigration; Acadians in New England; and current FrancoAmerican identity issues.

New France

Through their explorations, 17th-century fur traders, *coureurs de bois* (woods runners), *voyageurs* (canoe men), explorers for the Crown, Jesuit missionaries, and the colonial militia expanded the territory of New France, centered in Quebec City and Montreal (founded by Samuel de Champlain in 1608 and by Maisonneuve in 1643, respectively) to what is now a large part of the continental United States. They explored the Great Lakes and the Mississippi and its tributaries, the Missouri and the Ohio, and established fur trading posts, military forts, and missions at strategic points along these waterways. They paved the way for French Canadian settlements, which grew up around these sites in the 18th century. These settlements were relatively small—the total population of New France has been estimated at only 60,000 *habitants* (settlers) by 1760. Yet, a case can be made for French folk cultural influence extending into the 20th century, despite France’s loss of its colonial empire and the subsequent loss of the French language among *habitant* descendants.

France ceded to the British by treaty in 1763 the Upper Midwest, that area north and west of the Ohio River that would become the Northwest Territory by ordinance of the U.S. Congress in 1784. It ceded to the Spanish the vast Louisiana Territory which the Americans later obtained in 1803. Detroit, which was founded in 1701, New Orleans in

1718 and St. Louis in 1764 are just a few examples of the 3,000 places in the United States whose names still mark the outlines of what was once New France.

The *voyageurs* have a special place in American folklife study. Although their image is part of the romanticization of the frontier, an earlier generation of scholars—notably, French Canadian folklorist Marius Barbeau and American historians Theodore Christian Blegen and Grace L. Nute—traced these boatmen’s distinctive folk patterns, especially their *chansons* (songs). The *chansons*, like other worksongs, apparently helped the *voyageurs* paddle in unison and build morale and identity through two centuries: first, for the French fur-trading monopolies; then for the North West Company; and, finally, for the American Fur Company. Typically, novice boatmen, called *mangers de lard* (pork eaters), brought manufactured goods from Montreal to a point on the north shore of Lake Superior, now Grand Portage, Minnesota, to exchange for furs. The experienced boatmen, called *hivernants* (winterers), traveled there from far-flung posts in the interior with pelts for the manufactured goods in return. The *hivernants* shared their repertoires, polished by long winter nights of singing and fiddling, with the less experienced men before returning to their posts to begin the cycle anew.

Yet, their songs also connected the *voyageurs* to *habitant* culture because they usually selected and adapted 17th-century traditional tunes and lyrics also sung in settlements throughout New France. Barbeau writes that folksongs were “as familiar as barley-water to the home-keeping villagers of Quebec, Acadia, Detroit and Louisiana.” Marcel Bénéteau, a researcher at Laval University, has found, for example, that this folksong tradition was extant in the Detroit River region settlements the 1940s (Bénéteau 1991). French families, whom he has interviewed on both sides of the border since the 1980s, have given him “scribblers,” or handwritten books, with song texts. They have also remembered songs sung at *viéllees* (traditional evening gatherings), as well as at weddings and other celebrations whose versions date back to this early period. Both *voyageurs* and *habitants* once sang “A La Claire Fontaine” (At the Clear Fountain), now called the unofficial anthem of French Canada, and the familiar “Alouette” (The Lark), for instance.

Other *habitant* folklore and folklife has been recorded in states created from the old Northwest Territory—Illinois, Indiana, Michigan, Minnesota, Ohio and Wisconsin—and from those states once part of the Louisiana Territory—Louisiana and Missouri, in particular. These works suggest that distinctive verbal arts, social folk customs, and material culture, once based in the French colonial agricultural and mercantile economy and Catholic religious structure, are, for some, cultural memories and, for others, ongoing or revived traditions in these localities.

M.C.W. Hamlin, writing *Legends of le Détroit* in 1884, noted *les peurs* (horror stories) about *la chasse galerie* (the phantom canoe), *le feu follet* (fairy lights), and *le loup garou* (the werewolf) as well-remembered narratives among French families “on the strait” between Lakes Michigan and Erie. WPA (Works Progress Administration) folklife researchers recorded these same stories as memory culture in 1930s Vincennes, Indiana. Folklorist Ron Baker edited their findings in his *French Folklife in Old Vincennes* (1979). Baker discusses Vincennes’ strategic position in New France from the 1730s; as a fort, then a village, it was located at the confluence of the Wabash and Ohio Rivers and so allowed water access from Detroit to New Orleans. French Canadian folklorist Joseph Médard Carrière also recorded *contes* (classic wonder tales) about the hero ‘Tit Jean

(Little John) in the 1930s from residents in Old Mines, Missouri, a village dating from the 1760s that was originally made up of French colonials who had come from France or from the Illinois Territory, which had gone to the British. In the mid-1990s, folklorist C. Ray Brassieur is continuing folklife study among Missouri Creoles.

In his article "The Lingering Shadow of New France," Dennis Au notes that the French custom of *charivari* (shivaree) is still practiced in Monroe County, Michigan, in what was once the River Raisin settlement of the 1780s, augmented by French families leaving Detroit once British rule was established there (Au 1987). Mary Agnes Starr found the same tradition in some Wisconsin French communities in her *Pea Soup and Johnny Cake* (1981), noting that the custom of making noise outside newlyweds' home was once a sign of community disapproval of an inappropriate marriage (for example, one spouse was much older, too recently bereaved or not a Catholic), but was now just one more prank played by friends on the new couple. Traditional Christmas suppers after Midnight Mass and New Year's gift giving and blessings are other customs not only surviving but also evolving within families on the eve of the 21st century.

Baker and Au outline *habitant* material culture, including settlement and agricultural patterns. The "ribbon farm," in which houses cluster at river's edge and fields stretch out in long, thin plots behind, occurs often, and there is other typical log-cabin construction and tool use. They also note foodways legacies, including use of outdoor bakeovens, construction of traps and trapping techniques, and a variety of dishes for everyday and festival use. Au traces muskrat eating, for example, still current in some parts of Michigan and Ohio, to the *voyageurs*, who learned the techniques for trapping the animal and preparing it from the Native American groups originally in the area. These muskrat-eating French call themselves and their patois "Mushrat French" to distinguish themselves from the Quebecois and continental French.

Métis (Michif or Mechif) Culture

The *Métis* are descendants of 17th-century French *voyageurs* and/or 18th-century Scottish and Irish trappers and Native American women. As almost all settlements in New France included interracial marriages, conducted either according to "the customs of that country" or according to Quebecois tradition, many of those who trace their ancestry to that colonial period are "of mixed blood." Many French Canadians who immigrated to the United States in the 19th and 20th centuries to work in the lumber camps also married Native American or *Métis* spouses.

Métis communities in Canada have a stronger sense of a distinctive ethnic grouping than do those in the United States, perhaps because *Métis* Louis Riel led an 1869 rebellion in what is now Manitoba and a second in 1885 in what is now Saskatchewan and has been memorialized in folk ballads. *Michif* or *Mechif* are the terms used more often in the United States for those of mixed ancestry. Individuals in the United States may define themselves as *Métis*, *Michif*, or *Mechif*, French, or French Canadian, or as Native American. Aunt Jane Godreau, interviewed by folklorist Richard M. Dorson in Michigan's Upper Peninsula in the 1940s, for example, was French Canadian and Ojibwa

(Dorson 1948). Her repertoire of anecdotes, legends, and jokes about “half breeds” and Dorson’s comment that she lived in one of the “half breed” villages along the shores of Lake Superior suggest that she could have been defined as *Métis* or *Michif*, although she was either self-identified or identified by Dorson as a *canadienne* in his *Bloodstoppers and Bearwalkers* (1952).

Filmmaker Michael Loukinen and his consultants found that the fiddlers they documented in the 1991 ethnographic film *Medicine Fiddler* defined themselves ethnically in all of these ways. Although the focus of the film is on Native American and *Métis* incorporation of a European instrument and musical styles into blended but distinctive repertoires, the French or French Canadian strands emerge through the accompanying booklet edited by folklorist James Leary (Leary 1992). Fiddlers define an older style of playing as “the old furtrading way” since it was the French *voyageurs* who first introduced fiddles and step dancing to native peoples at trading posts and weddings. French Canadians continued the traditions in lumber camps and taverns. The fiddlers also recognized specific tunes, such as “Red River Jig” and “White Fish on the Rapids,” as French contributions.

Nineteenth-Century French Canadian Immigration

So many French Canadians left Quebec Province for the United States between the 1840s and the 1920s that *La Belle Province* was said to have lost one-third of its population, and communities in the United States dating from colonial New France were designated “Old French” to distinguish them from the new. As indicated above, many Quebecois came to work in the white-pine lumber industry in New England and the Upper Midwest. Folklore researchers have noted French Canadian traditions in the lumber camps and towns from Maine to Michigan, reminiscent of the *voyageur* traditions two centuries before and connected to the folklife in contemporary Quebecois camps. Loggers shared similar *contes* and *légendes* at *des veillées d’cahiers* (evening gatherings in the camps) and often brought them home to kitchen hearths through the 1940s. Dorson, with French folklorist Ariadne Felice in Michigan, French Canadian folklorist Jean-Claude Dupont in Michigan, Vermont, and New York, and American folklorist Horace P. Beck in Maine, found, for example, that loggers supplemented the older stories and songs with newer genres of tall tales about extraordinarily strong men. Dorson also recorded a new genre of dialect stories performed by French Canadian and Franco-American raconteurs in Michigan’s Upper Peninsula from the 1940s that commented humorously on language differences and issues of acculturation and identity (Dorson 1948).

Even more Quebecois (many, but not all, farm families) emigrated to work in New England industrial centers, especially in textile mills, shoe factories, and construction companies. French-Canadian sections of towns and cities, called *Petits Canadas* (Little Canadas) sprang up in Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont. Researchers at the French Institute at Assumption College in

Worcester, Massachusetts (cf. Quintal 1983), and at the Franco-American Resource Opportunity Group at the University of Maine at Orono, for example, have documented the social, political, and historical dimensions of these diverse communities. They have found that Little Canadas had fluctuating populations since many residents moved freely back and forth between the United States and Canada. Some residents repatriated; others moved out as they acculturated to American life. Although Little Canadas no longer exist geographically, a great percentage of New Englanders are of French Canadian descent so that folk-cultural matrices remain within Franco-American contexts.

Folklorists and folklife specialists have documented French Canadian folk cultures and Franco-American folklife in mill towns and former mill towns. Brigitte Lane's comprehensive study *Franco-American Folk Traditions and Popular Culture in a Former Milltown*, based on her fieldwork in the 1980s, traces aspects of ethnic urban folklore and the dynamics of folklore change in Lowell, Massachusetts (Lane 1990). Lane finds, as Dorson did earlier for Michigan's Upper Peninsula lumber towns, that the older French Canadian genres, often Quebecois cultural survivals, are memory culture with symbolic implications, while the newer joking forms as well as immigrant stories and personal-experience narratives are current in Lowell. These newer narratives have a self-reflexive quality, playing on Franco-American understandings of language maintenance and change.

The Lowell Folklife Project, sponsored by the American Folklife Center at the Library of Congress in 1987–1988 with folklorists Peter Bartis as director and Doug DeNatale as field coordinator, was designed to document Lowell's then-current cultural traditions (cf. Bartis 1988; DeNatale 1988). Researchers found that Franco-Americans, one of the oldest groups represented in the study, negotiated their own ethnic awareness juxtaposed with Irish, Greek, Portuguese, Puerto Rican, and Cambodian communities in a folklore of ethnicity. The fieldwork data are available at the Library of Congress.

The American Folklife Center's 1979 Rhode Island Folklife Project included a Franco-American component as well. Folklorist Jerry Johnson focused on folksinger and tradition bearer Roméo Berthiaume, then living in the former mill town of Woonsocket. Berthiaume, whose family had moved back and forth between Quebec and Rhode Island and who had worked in the mills, recalled the family *veillées* in both countries as instrumental in developing his love of French Canadian cultural traditions. He once said that his repertoire of 350 songs helped him express feelings that were "dear to those who are interested in our ethnic background." He also wrote his own songs, short stories, and plays, which extended his Franco-American cultural expression. Field research material is also available at the Library of Congress (Lane 1990:145–148).

Franco-American storyteller Michael Parent draws on his memories, personal-experience narratives and family stories of growing up in Lewiston, Maine, for his performances and writing as well. His award-winning audiotape *Sundays at Grandma's House (Dimanches chez memère)* (1988) evokes memories of family life within a bilingual-bicultural mill town, as does his piece "Olive and Bidou" in *Lives in Translation: An Anthology of Contemporary Franco-American Writings* (1991) edited by writer Denis Ledoux. Both Berthiaume's and Parent's work confirm what folklorist Julien Olivier told Lane in a 1982 interview: "Qu'il y ait une culture qui est surtout une culture orale, pour moi c'est du folklore aussi." ("Where there's a culture that is completely oral, then, for me, it's also folklore") (Lane 1990:154). Olivier's work on

Franco-American traditions in New England, directed toward education of young people in confirming their ethnic and regional identity, is a relatively early example of putting folklore to use (cf. Olivier 1979).

Acadians in New England

When the Maine state legislature funded the creation of the Acadian Archives (*Archives Acadiennes*) at the University of Maine at Fort Kent in 1989 and the U.S. Congress passed the Maine Acadian Culture Preservation Act in 1990, these official acts sanctioned a cultural identity long recognized in the state's Upper St. John River Valley, located in the northernmost county of Aroostook. Acadians, many from Brittany and Normandy, had settled in a region the French called "Arcadie" or "Acadia" after a Micmac name for what is now Nova Scotia, New Brunswick, and Prince Edward Island. Their principal settlement of Port-Royal (now Annapolis, Nova Scotia) had been founded by Samuel de Champlain in 1605 before he moved up the St. Lawrence River to found Quebec in 1608.

The British and the French contested claims to Acadian lands for a century and a half. The British governor in Nova Scotia deported many Acadians in 1755, questioning their allegiance in the impending war with France. Some settled in the Upper St. John River Valley, while others went down the Mississippi River to Louisiana, where they became known as Cajuns. At the conclusion of the French and Indian war in 1763, more Acadians from Cape Breton and Ile St. Jean (later Prince Edward Island) settled in the valley as well. *La Grande Dérangement*, as the Acadian Diaspora is called, lasted officially from 1755 to 1763, but its cultural significance remains among Acadians in the late 20th century. The Acadians were joined by French Canadians from Quebec by 1831. Although the Acadian cultural presence is more strongly marked in this region, its French language and culture draw from both groups. Once the international boundary line between New Brunswick and Maine was established in 1842, more settlers moved across the border to augment the communities in the United States.

A number of folklorists have noted Acadian and blended-French folklife in the Upper St. John River Valley in the 19th and 20th centuries. The bibliography *Folklore and Folklife in the Upper Saint John Valley* (1994), prepared by folklorist Lisa Ornstein, director of the Acadian Archives (*Archives Acadiennes*), shows that French folklorist Geneviève Massignon, French Canadian folklorist Luc Lacourciere, Acadian folklorist Catherine Jolicouer, and Franco-American folklorist Roger Paradis have been among those who have documented the folk arts of the region. Paradis' article, "Franco-American Folk-Lore: A Cornucopia of Culture," based on a series of lectures at the University of Maine at Fort Kent, looks at the connections between folklore and history—for example, in evaluating some of the region's historical legendry, including that about *la guerre des sauvages* (the French and Indian War) and the Acadian Diaspora—within his argument for critically recognizing this French regional folk culture (Paradis 1974).

Paradis also briefly summarizes *la coutume* (social folk customs) of the early settlers, which include domestic arts and crafts such as foodways, weaving and embroidery, medicine making for the women, and lumbering, farming, hunting, and trapping skills for the men. The American Folklife Center's 1990–1991 Maine Acadian Cultural Survey, with folklorists David A. Taylor as director and C. Ray Brassieur as field coordinator, documented their retention and change in the valley in the late 20th century (Brassieur 1991). Foodways traditions, which Brassieur notes are both Acadian and regional, are especially long lasting. *Pâté chinois* (a shepherd's pie made of mashed potatoes, ground meat, and corn) and "JoJo potatoes" (batter-fried potatoes), reflect the major agricultural crop of the region. Buckwheat *ployes* (thin pancakes) are a regional specialty as are *tourtières* (meat pies, originally Quebecois, made for special occasions).

Out migration to southern New England to work in the textile mills drew many Acadians from the St. John Valley in the late 19th and 20th centuries as it had the Quebecois. Acadian communities, therefore, are scattered throughout the New England states, especially in Connecticut and Massachusetts. Brassieur writes that the connections between the valley and these communities continue, evidenced most clearly in a whole system of summer family reunions, the annual Acadian Festival Family Reunion being a more public sign of the private get-togethers.

Franco-American Identity Issues

Patrice Higonnet, writing about French immigration to the United States from the time of the English colonies to the late 20th century, in the *Harvard Encyclopedia of American Ethnic Groups* (1980), states that most emigrés did not maintain a cultural identity and that most came as middle- or upper-middle-class individuals whose culture it was to assimilate to American values. This acculturation process was especially true of the French Huguenots, or French Protestants, such as Paul Revere's father, who identified with English Protestants more readily than with the French Catholic regime that had deported them when the Edict of Nantes granting religious freedom was revoked in 1685. Elliott Barkan, writing in the same encyclopedia about French Canadians in the United States, notes that the movement from French Canadian to Franco-American to American is the most common one, and inevitable once the French language is lost. James Parker suggests that a French American identity is a mythic one, in his *Ethnic Identity: The Case of the French Americans* (1983).

Given the sense among these scholars that a Franco-American identity is not a viable one, how folklife specialists and the communities they have studied see these issues is instructive. Roger Paradis, speaking of French culture in Maine in 1974, said that "within a few years, Franco-American folk-lore as a folk culture, at least in its traditional form, may have ceased to exist" (Paradis 1974:44). Franco-American folklorist Julien Olivier and French folklorist Brigitte Lane, speaking of Quebecois in New England, agree that the old social structures have been changing since the 1940s and that traditional folklore forms are endangered, but they also agree that new forms and adaptations are emerging, many of them closer to popular culture, so that the definition of "Franco-American

folklore” needs expansion. Folklorists C.Ray Brassieur and Dennis Au, speaking for the Old French and Creole communities in the Midwest, see that submerged identities and corresponding folk cultural behavior can exist regardless of communities’ self-perceptions. Lane concludes her 1990 study with the hope that “as ethnic pride seems to be thriving among the Franco-Americans” so ethnic rediscovery and folklore revivals will follow. She writes, “Obviously the battle for ‘*notre langue, notre foi, et nos coutumes*’ [our language, our faith, and our customs] is not over, even if it is assuming today new and different dimensions within the group itself” (Lane 1990:462).

Friday the Thirteenth

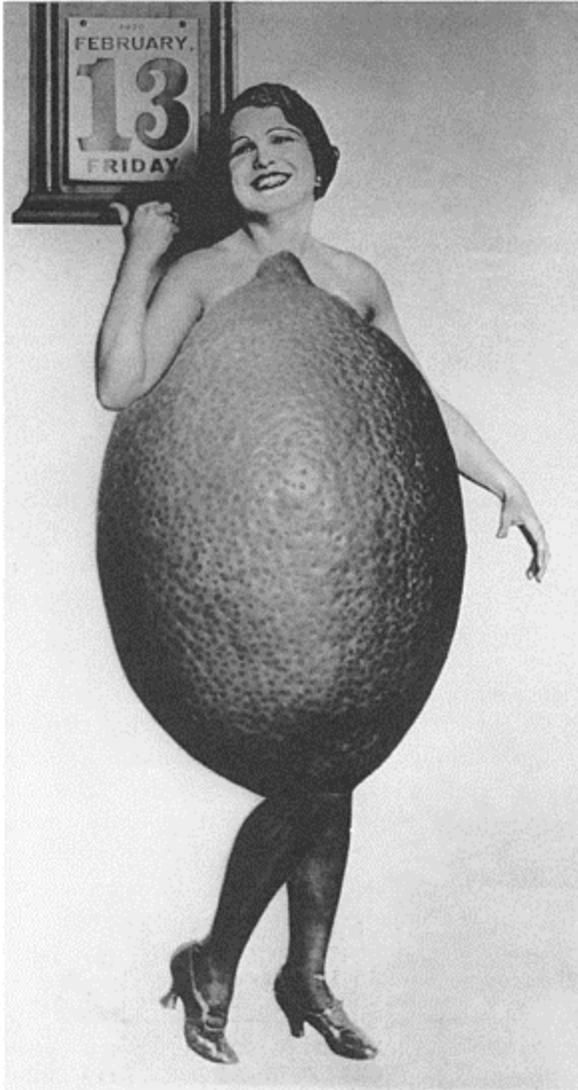

A date—occurring from one to three times a year—widely believed to be unlucky. Although widespread, the notion that Friday the Thirteenth is unlucky has received surprisingly little attention from scholars. Aside from entries on “Friday” and “thirteen” in the major collections of popular beliefs and superstitions, one must turn to the news media to find published references to the persistence of the belief.

The association of Friday the Thirteenth with bad luck is the result of a complex interaction of ancient folk beliefs. Friday has long carried negative connotations, in great part because, according to Christian tradition, Christ was crucified on a Friday. In addition, Friday was a holy day in many early cultures. Work was considered inappropriate or was even prohibited on Fridays in such societies. This tradition persists in the belief that one should not begin a project on a Friday unless it can be completed the same day. (Some people attach this belief to Friday the Thirteenth.) In addition, early Christian missionaries associated the holy day of pagan people with evil.

The number thirteen, although considered a lucky number in some cultures (for example, the Chinese, the Hebrews, and some Central American Indians), is widely believed to be unlucky. To some people, twelve symbolized completion; thus, thirteen represented excess. Thirteen people were present at the Last Supper—Jesus and his twelve disciples—one of whom was to betray him.

Various cultures have told stories of gods and goddesses or magical beings who attend a banquet for twelve guests. An uninvited thirteenth guest arrives and wreaks havoc. (Loki kills Baldur in Norse mythology; Eris tosses a golden apple inscribed “For the Fairest” into the midst of the Greek deities, which eventually leads to the Trojan War; the thirteenth fairy at the celebration of Sleeping Beauty’s birth curses the child.)

Triskaidekaphobia, the fear of the number thirteen, manifests itself in many ways. Numerous contemporary tall buildings have floors numbered one through twelve, followed by fourteen. At least one major airline (no longer in business) did not use thirteen on gates, on rows of seats, or in flight numbers.

Rose Cade, Queen of the Lemons, points to a reminder of her nomination as the “Swat thejinx” girl. Southern California, 1920. Library of Congress.

People often cite examples of negative events associated with the number thirteen. The lunar mission Apollo 13 suffered an explosion on April 13, 1970 (a Monday) and had to return to Earth earlier than planned. Of course, not all instances of thirteen are believed to

be unlucky in America. Consider the thirteen stars and other occurrences of thirteen on the seal of the United States, or the extra item in a baker's dozen.

With many negative associations, the number thirteen, when combined with an evil day—Friday—has come to be considered especially unlucky. Some people claim that Friday the Thirteenth is unlucky for all except those born on such a day. In contrast, others believe:

A child born on Friday the thirteenth must carry with him a rabbit's foot from a rabbit killed at midnight by a cross-eyed farmer. Otherwise, it will bring bad luck to die family. If he loses the rabbit's foot, he will die. (Puckett, item 3865)

Just as people can cite examples of the negative influence of the number thirteen, so do the media play up the connotations of Friday the Thirteenth. An immensely popular series of movies, *Friday the 13th* and its numerous sequels, began in 1980. The films spawned a television series as well. The movies center on a fiend—Jason in most of them—who murders teenagers with bloody glee.

Consider also the following three examples from October 13, 1989, that were discussed by major newspapers in relation to Friday the Thirteenth. The Dow Jones Index dropped 190 points in that day's final hours of trading. The next Friday the Thirteenth, in April 1990, the market was closed. (Of course, it was also Good Friday.)

The American Cancer Society had planned to hold a medieval festival in Saratoga Springs, New York, on that Friday. After complaints from fundamentalist Christians about the day's evil associations, the rhyme of "medieval" with "evil," and plans to include fortune-telling at the event, the society dropped the theme in favor of a costume ball. The date was not changed.

Finally, the media widely reported the threat supposedly facing personal computers in the United States: a computer "virus" dubbed Friday the Thirteenth. Although the virus was expected to destroy the data in many computers, few people reported actual attacks.

Ironically, the persistence of fear of Friday the Thirteenth may be due in large part to the media's keeping the tradition in the public's consciousness.

Fuller, Blind Boy (Fulton Allen) (1908–1941)

Piedmont blues artist. Born in Wadesboro, North Carolina, in 1908, Fuller learned guitar as a teenager. By 1935 he had mastered the techniques of the Piedmont tradition, a blues style associated with the Carolinas and Virginia. Solo or working with Gary Davis, Sonny Terry, or washboard player Bull City Red, Fuller recorded a substantial body of work over a six-year span. He was one of the most recorded artists of his time and by far the most popular and influential Piedmont blues player of all time.

Initially discovered and promoted by Carolina entrepreneur H.B.Long, Fuller recorded for ARC, Decca, Vocalian, Okeh, and Columbia. He also served as a conduit to recording sessions, steering fellow blues musicians to the studio. In spite of his recorded output, most of his musical life was spent as a street and house-party musician. Adept at various guitar styles, he could reinterpret or cover other artists' hits. In this sense, he was a synthesizer of styles, parallel to Robert Johnson, his contemporary. Like Johnson, Fuller lived fast and died young.

Fuller was a fine expressive vocalist and a masterful guitar player best remembered for his uptempo ragtime hits "Rag Mama Rag," "Trucking My Blues Away," and "Step It up and Go." At the same time, he was capable of deeper material, as evidenced by his versions of "Lost Lover Blues" and "Mamie." Because of his popularity, he may have been overexposed on records, yet the majority of his songs stayed close to tradition, and his repertoire and style are kept alive by North Carolina and Virginia artists.

Functionalism

A theoretical perspective that attempts to explain folklore and other sociocultural phenomena in terms of their functions or effects on the wider social or cultural system. "Function" is distinguished from "purpose" or "use" in that it does not presuppose any conscious or deliberate intention in bringing these effects about.

The concern with "function" in the social sciences depends on an analogy drawn between biological and social processes. The analogy began with Auguste Comte (1798–1857) and was extended by Herbert Spencer (1820–1903), who argued that, like biological organisms, societies were built up from discrete structures that fulfilled distinct functions. Biological and social life depended on component structures functioning to fulfill the needs of the organism. Emile Durkheim (1858–1917) emphasized the importance of both causal and functional analysis in the understanding of social facts. Causal analysis focused upon the antecedents of a particular social institution, whereas functional analysis concentrated on the contribution that institution made to the larger social system of which it was a part. For Durkheim, the ultimate contribution, and the one he emphasized in virtually all of his analytical works, was the reinforcement of "collective sentiments" and the strengthening of those bonds essential to holding society together.

A.R.Radcliffe-Brown (1881–1955) and Bronislaw Malinowski (1884–1942) both read Durkheim, and each introduced a type of functionalism into anthropological theorizing. Radcliffe-Brown directly followed Durkheim, focusing on the structure of social relations and the contribution of these structures to the integration of society. When the function of a particular structure in integrating the society could be shown, that structure was, in effect, explained. For example, Radcliffe-Brown regarded the taboos against eating dugong, pork, and turtle observed by expectant parents in the Andaman Island as standardized expressions that symbolized the significance and importance of the reproductive event to the parents and the community. The care and concern required in observing such ritual prohibitions establish and fix those fundamental values that bind a society together.

Malinowski attempted to present a theory of society based on needs that had to be fulfilled if a society were to endure. There were the basic biological needs—nutrition, reproduction, bodily comforts, safety, movement, growth, and health—that every culture had to satisfy, at least minimally, if it were to survive. The satisfaction of these basic needs, however, creates derived cultural needs that demand economic systems, mechanisms of social control, education, and political organizations for their fulfillment. Culture itself depends upon the fulfillment of *symbolic* or *integrative* needs. Knowledge ensures the continuity of experience within society. Magic and religion provide intellectual, emotional, and pragmatic means to deal with chance and the inevitability of human death, while myth explains and validates a society's institutions. The particular institutional forms that might fulfill basic, derived, or symbolic needs would necessarily vary from society to society, but these needs would have to be met by all societies in

some way. The contribution of an institution to meeting a basic, derived, or integrative need constitutes its function.

Functionalism was introduced into folklore by anthropologists. William R. Bascom (1912–1981), in his essay “Four Functions of Folklore,” enjoined folklorists to pay more attention to the social and cultural contexts of folklore and to the functions which folklore fulfilled in society (Bascom 1954). Drawing directly on Malinowski’s work, Bascom defined and illustrated four particular functions of folklore. The first was *escape*; that is, escape in fantasy from the restrictions and frustrations imposed on the individual by his or her society or environment. For example, Zuni folktale motifs concerning the abandonment of children might permit the expression of a resentment against children that the Zuni could not express more directly. The second function was *validation*; folklore could be used to justify the rituals and institutions of the society. A myth might be used to justify a particular ritual, or a proverb might be used to validate why a particular course of action was the correct or appropriate one. The third function was *education*. Folklore could inculcate the values of the society in the younger generation. Folktales frequently illustrate moral principles and describe the consequences of failing to strictly obey them. The role of folklore in education was noted as particularly important in nonliterate societies in which all education was conducted orally or through customary example. The fourth function was *social control*; folklore could be used to reward and punish individuals in order to ensure conformity to group standards. A traditional song, riddle, or proverb could be recited to express disapproval or to ridicule someone who had violated a social norm. Bascom recognized that these four functions were not the only functions of folklore. Nevertheless, he saw these as the most important ones. Each could contribute to the maintenance of a cultural system through time.

During the late 1950s and 1960s, a number of folklore essays began to appear with the term “function” in their titles. Alan Dundes reprinted a series of essays on function—including Bascom’s 1954 essay—in his anthology *The Study of Folklore* (1965), thereby introducing a burgeoning generation of folklore students to the functional perspective. Function became a basic element in the teaching of folklore analysis. American folklorists made particular use of the psychological function of escape in their efforts to explain seemingly irrational behaviors and fanciful narrative motifs and episodes.

Fishing superstitions, dowsing, ethnic humor, cruel jokes, lullabies, and whaling songs are some of the forms of American folklore that have been examined from a functional perspective. For example, superstitions among Texas coastal fisherman were studied by Patrick B. Mullen (Mullen 1969). Despite their employment of the latest in communications and fishing technologies, coastal fishermen would not sail with women on board, they would not bring black suitcases or utter the word “alligator” on board, nor would they turn a hatch cover upside down. Following Malinowski, Mullen claimed that such superstitions were the fishermen’s response to the anxiety engendered by the dangerous and uncertain conditions of their enterprise. The superstitions functioned to reduce this anxiety by giving the fishermen a sense of mastery of forces over which they had no real control. Mullen’s hypothesis was supported by the fact that the more hazardous sea fishery involved twice as many magical beliefs as the safer bay fishery.

By the mid-1970s, the heyday of functionalism had passed. The rationale for functionalist analysis had been undermined in anthropology and sociology. Functional explanations were shown to be illogical, teleological, and grounded in questionable

assumptions. At best, they could serve to point out important, if unnoticed, effects of, and interrelations between, a cultural practices, but they explained nothing. In folklore studies, the embrace of functionalism had largely been the embrace of a culturally and socially situated analytic and interpretive paradigm—a paradigm absent in earlier diffusionist and literary approaches to folklore. As emerging structuralist, semiotic, performance, and phenomenological perspectives offered alternatives to, or subsumed, functionalist assessments, functionalism faded as an explicit approach to the analysis and interpretation of folklore.

Fund for Folk Culture

Nonprofit, publicly supported foundation established in 1991 to help answer the need for increased funding for the field of folk arts and culture. The Fund for Folk Culture (FFC) is dedicated to the preservation, dissemination, study, and appreciation of the multiplicity of folk cultures in the United States and abroad. The fund raises monies from foundations, public-sector sources (such as the National Endowment for the Arts), and private individuals, and then regrants funds to organizations, individuals, and projects in the folk arts and culture. The FFC also provides technical assistance, education and consultation as services to the field.

The fund was created as a vehicle to provide a national, non-profit corporation as a response to the increasing need for a flexible, private organization that could bridge the gap between private-sector funding sources and the growing folkculture field. In 1990 conversations began between Jillian Steiner Sandroock, who had initiated the now-discontinued folks-arts funding program of the L.J. and Mary C.Skaggs Foundation, and several important individuals in the folkculture field. These individuals, who formed a Fund for Folk Culture planning committee to assess the feasibility of creating the FFC, included Alan Jabbour, director of the American Folklife Center at the Library of Congress; Joseph T. Wilson, executive director of the National Council for the Traditional Arts; folklorist Archie Green; and cultural historian Raye Virginia Allen. This planning committee for the fund ultimately became the organization's founding board of trustees. The FFC's initial funding came from the National Endowment for the Arts folk arts program, the National Council for the Traditional Arts, the L.J. and Mary C.Skaggs Foundation, and contributions from individuals.

Shortly after its incorporation in 1991, the organization entered into a partnership with the James Irvine Foundation to create and administer a folk-arts regranting program. This was a specialized program to support folk arts and tradition bearers in the state of California, with funding provided by the James Irvine Foundation. In May of the same year, the Lila Wallace-Reader's Digest Fund commissioned the FFC to undertake a national needs assessment for the folk-culture field. Results of this national survey, which involved approximately 900 individuals, led the Lila Wallace-Reader's Digest Fund to launch a major initiative to support the folk arts in the United States. As part of this initiative, the fund made a \$1 million grant to the FFC to underwrite the Lila Wallace-Reader's Digest community folklife program. The FFC's first national regranting program, the pilot effort supported communitybased activities to preserve, strengthen, and document folklife and folk-arts traditions, as well as to present them to the public in educational and celebratory programs.

A relatively new organization, the Fund for Folk Culture envisions a future in which it will continue and expand state, regional, national, and international technical assistance and grant-making programs and function as an advocate for folk culture in the broader spheres of the arts and humanities, economic development, and education.

Games

Recreational, usually competitive, activities with agreed-upon rules that organize play and provide criteria for determining winners and losers (Roberts, Arth, and Bush 1959). Games may be played either alone or with others, and opposition may occur between players or teams or with impersonal obstacles or fortune. The desired outcome or goal is only sometimes achieved. Like play, games are generally voluntary and non-utilitarian, but they are sufficiently systematic in their rules and procedures that they can be repeated by others (Avedon and Sutton-Smith 1971). Sports are generally distinguished from games by the vicarious participation of persons other than the players and a more formal institutional structure.

Like much of the early study of folklore and folklife, serious scholarly interest in games began in the last half of the 19th century and reflected the Romantic impulses of the period. The early collectors combined an interest in identifying patterns of cultural contact and diffusion with an antiquarianist concern for preserving the vestiges of ancient lore. William Wells Newell, a founder of the American Folklore Society who published the first major collection of American children's folklore, *Games and Songs of American Children* ([1883] 1963), reflected both of these concerns.

Like many others at the time, Newell believed that the traditions he was studying were rapidly dying out. This led him to collect the childhood memories of adults rather than the ongoing traditions of contemporary children. He assumed that the further back in time he reached, the richer the traditions would be and the closer he would come to their "original" forms. This perspective characterized most of the work on games well into the 20th century and may still be found in contemporary game collections.

Newell also systematically annotated his collection with similar rhymes and games found in historical documents and in non-English-speaking countries. He argued that cultural diffusion was the only reasonable explanation for these similarities. Early anthropologists like Edward B. Tylor and Stewart Culin, who wrote *Games of North American Indians* (1907), also studied games for clues to patterns of cultural evolution, contact, and diffusion, and for vestiges of primitive magical practices. They also observed, however, that many children's games mimic culturally important adult activities like hunting and combat, and they proposed that games continue to play an important role in the enculturation of children.

The other major 19th-century English-language collection of children's games, Lady Alice B. Gomme's two-volume work *The Traditional Games of England, Scotland, and Ireland* ([1894, 1898] 1964), also reflected a greater concern for what children's games

could tell us about the past than for what they could tell us about the present. She believed that children's games were imitations of adult customs, preserved over centuries only in the play of children. Like Newell, Gomme relied primarily on the recollections of adults, looked for patterns in the geographical distribution of games in the British Isles, and annotated connections with folk customs and similar rhymes and games in historical documents.

American Paul G. Brewster, who published extensively on games from many parts of the world beginning in the late 1930s (see bibliography in Avedon and Sutton-Smith 1971:162–164), continued the diffusionist and antiquarianist tradition. His *Children's Games and Rhymes* (1953) represents the most extensive early collection of children's games in the United States.

While interest in the origins and diffusion of games has continued, studies of children's games are no longer primarily driven by the belief that they are historical documents to be preserved and deciphered. Educator Dorothy Mills Howard, who began collecting games in the early 1930s, was a pioneer in studying the ongoing traditions of contemporary children and collecting games directly from children themselves. The changing focus of games studies is most evident, however, in the work of Iona and Peter Opie, who began collecting children's folklore in the British Isles in the 1950s, and Brian Sutton-Smith, who studied games in New Zealand in the late 1940s and the early 1950s and, later, games in the United States.

in the games they ought to play...[or] instructing adults on how to instruct children in the games they ought to play," the Opies used extensive surveys of schoolchildren to "record games children in fact play...of their own accord when out of doors, and usually out of sight" (Opie and Opie 1969:v). In their *Children's Games in Street and Playground* (1969) and *The Singing Game* (1988), and in Iona Opie's *The People on the Playground* (1993), they documented a rich and dynamic body of ongoing tradition. The remarkable historical preservation and broad geographical distribution they found in children's games were strong evidence for the vitality and continuity of children's lore in Great Britain. Children's games were far more than hollow vestiges of the past, and they did not appear to be in immediate danger of extinction.

The Opies were influenced by Sutton-Smith, who had documented a similarly vital and dynamic body of children's games, but while the Opies focused on continuity in childhood traditions, he focused on how they changed over time.

Sutton-Smith set out to place contemporary New Zealand children's games in historical context by collecting from both children and adults and by extensively reviewing historical documents. He used newspapers and radio to solicit written accounts, conducted interviews, surveyed hundreds of college students, visited and collected reports from schools, and observed children's play at one school over a period of two years. In *The Games of New Zealand Children* (1959, reprinted in 1972 in his *Folkgames of Children*), Sutton-Smith organized his material historically within game type, contrasting the games played between 1870 and 1920 with those played between 1920 and 1950. *A History of Children's Play: The New Zealand Playground, 1840-1950* (1981) extended the historical record back to the English settling of New Zealand in 1840.

In these works, Sutton-Smith documented the explosion of traditional games that accompanied the introduction of compulsory schooling in the last half of the 19th century, and "the taming of the playground" (Sutton-Smith 1972:13) that occurred as adult supervision of playgrounds increased in the early 20th century. Rougher types of play decreased, even as more active types of play increased among girls. He showed how, especially from 1920 on, the influence of organized sports and recreation for children and the increasing presence of commercial toys led to the loss of traditional games. Many that survived were relegated to younger children, especially to girls.

Sutton-Smith also outlined a developmental progression from the choral and simple central-person games (like ring-around-a-rosy, hide-and-seek, and various forms of tag) played by children younger than ten years old to the more complex competitive and team games (like king of the mountain, marbles, hopscotch, dodgeball, and keep-away) played by older children. He proposed that dramatic, central-person games were popular among younger children because they replicated children's common experiences of family relationships. At the same time, he believed, they helped children master the give-and-take with peers necessary for the more complex competitive games of later years.

This early work launched Sutton-Smith on the most varied and persistent career of any researcher in the area of children's games in the United States. An educator and developmental psychologist by training, he has brought to his work an interdisciplinary perspective often guided more by the social sciences than by folklore. Over the years, he has drawn on historical, anthropological, developmental, and psychological theory and methods to explore children's games and game involvement. His *Folkgames of Children*

(1972) covers topics as diverse as the “it” role in children’s games, sex differences in play choices, historical changes in American children’s game preferences, and adolescent kissing games.

Numerous collections of games have appeared since these pioneering works. Many are small local or regional collections that are widely scattered through the literature (Sutton-Smith, Mechling, Johnson, and McMahon 1994 presents an extensive bibliography of children’s folklore, including games). Other collections, like Roger D. Abrahams’ *Jump-Rope Rhymes: A Dictionary* (1969) and (with Lois Rankin) *Counting-Out Rhymes: A Dictionary* (1980), are compilations of texts associated with particular game types. More general collections of American children’s folklore, like Mary and Herbert Knapp’s *One Potato, Two Potato: The Secret Education of American Children* (1976) and Simon J. Bronner’s *American Childreris Folklore* (1988), also include sections on children’s games.

There is no single, complete, and broadly accepted system for classifying games. Collectors have employed literally dozens of different game categories, and different collectors have categorized the same games in different ways. Some, like Gomme, simply presented their games alphabetically by title. Others, like Newell, ordered their collections in part around themes like love, history, and mythology.

Most collectors have relied on similarities in game structures or actions to group their games into categories and subcategories. Some of the more common categories of traditional games are: singing games (like London bridge), counting-out games (like one potato, two potato), chasing games (like tag), catching games (like prisoner’s base), seeking games (like hide-and-peek), leader or central-person games (like Mother, may I? or statues), daring games (like truth or dare), guessing games (like odd or even), fortune-telling games (like cooties), dueling games (like the dozens), acting games (like fox and chickens), pretending games (like cops and robbers), ball games (like dodgeball or foursquare), rhythmic games (like jump rope, hand-clapping and ball-bouncing games), gambling games or games of chance (like dice), parlor games (like charades or tic-tac-toe), games of skill (like jacks, marbles, hopscotch, or string games), and board or table games (like chess and various card games). Many other categories can be found in the literature, and it is likely that new types of games, like video games and fantasy role-play games, will eventually expand them still further.

Since the 1960s, cross-cultural studies have used a much simpler scheme for classifying games. In “Games in Culture,” anthropologist John M. Roberts and his colleagues categorized games based upon whether their outcomes depended on physical skill, chance, strategy, or some combination of these elements. They went on to demonstrate that the types of games played in different cultures are related to various dimensions of cultural complexity and evolution, and to variations in child-rearing practices (Roberts, Arth, and Bush 1959).

According to these analyses (reviewed in Chick 1984), complex cultures have more complex games and more types of games than simpler cultures. Games of physical skill (like races, hopscotch, and many marble games) seem to be very ancient. They are the most widespread among world cultures and appear at all levels of cultural complexity. In contrast, games of strategy (like checkers, go, and tic-tac-toe) appear to have developed later and are common only in societies with complex political and social structures. Games of chance (like bingo and a variety of dice and fortune-telling games) are more

common in societies characterized by environmental uncertainty, regardless of the degree of social complexity. Further, these analyses found that games of physical skill were associated cross-culturally with training children for high levels of achievement; games of strategy, with high obedience training; and games of chance, with training for high levels of responsibility. Combination games (like football which relies on both physical skill and strategy, and poker, which combines elements of strategy and chance) show even more complex and interactive patterns of relationship to childhood socialization practices.

Roberts and his colleagues explained these connections by proposing a “conflict-enculturation hypothesis” of game involvement. They believed that societal demands for particular qualities induce conflicts in children, who are then drawn to activities like games that allow them to explore and master these conflicts in a playful, buffered environment. From this perspective, games are “expressive models” of important cultural qualities and a medium through which children are gradually enculturated to core values and behaviors.

In the 1960s and 1970s, Roberts and his colleagues also extended this model to adult involvement in games like eightball pool, tennis, trapshooting, and soccer. In a series of ethnographic studies (reviewed in Chick 1984), they explored why individuals choose and abandon particular games, and how novice and expert players differ in their patterns of involvement in particular games. These are some of the very few studies of adult games in American culture outside of the context of sport.

Studies of the games of non-Anglo American children are also less common. A notable exception is Bessie Jones and Bess Lomax Hawes’ *Step It Down: Games, Plays, Songs, and Stories from the Afro-American Heritage* (1972). This is a compilation of children’s lore drawn from Bessie Jones’ experiences growing up in Georgia and the Georgia Sea Islands in the early 20th century. It includes many types of games, including baby games, clapping, jumping, and skipping games, singing and ring plays, dances, house plays, and outdoor games.

In her introduction, Hawes notes that almost all of the games reported by Bessie Jones are group activities involving music and dance. She reflects on how these games differ from the more individual, competitive games common in Anglo American culture, noting that many are miniature dramatic “plays” that publicly dramatize the conflicts and confrontations inherent in Afro-American life.

Comparisons like this of the games played by different groups within American society are rare. The only major exception is the games played by boys and girls. Game researchers have long noted gender differences in children’s games (reviewed by Hughes in Hollis, Pershing, and Young 1993:130–148). Boys and girls largely play in separate play groups and play different types of games throughout childhood, especially in the school settings where most children’s games have been observed and collected.

A number of differences have been noted in the games typically played by boys and girls. Boys’ games (like baseball, cowboys and Indians, and more recently video games) have been characterized as more complex, competitive, active, and aggressive than girls’ games. They more often involve physical contact, larger and outdoor spaces, larger and more mixedage play groups, and well-defined outcomes with clear winners and losers. In contrast, girls’ games (like hopscotch, jump rope, and clapping games) have been characterized as simpler and more passive, cooperative, and verbal. They more often

involve indirect competition among individuals rather than teams, smaller and more indoor spaces, smaller play groups (often twos or threes), more waiting in line, turn-taking, and sustained cooperative, choral activity (like clapping or skipping) rather than clear winners and losers.

It has been suggested that these differences prepare boys and girls for different adult roles. The small, intimate play groups common among girls, and the more cooperative, verbal, and passive quality of their play, has been associated with preparing girls for traditional domestic roles. The more active, aggressive, and competitive qualities of boys' team games and sports have been similarly associated with preparation for work roles.

One of the interesting questions in games study is whether recent changes in adult gender-role expectations, and attempts to increase girls' participation in sports, will result in changes in the games girls and boys play. At least since the 1920s, boys appear to have been narrowing their game choices largely to ball games and other sports-related activities, while girls have increased their involvement in more active games and their interest in games previously played mostly by boys. It is not clear, however, how much girls' spontaneous game participation has actually changed.

Folklore studies have recently moved away from analysis of isolated texts like game descriptions or rhymes toward more in-depth analysis of the contexts in which folk groups create and communicate traditional culture. Folklorist Kenneth S. Goldstein (in Avedon and Sutton-Smith 1971:167–178) was an early advocate of ethnographic field studies of how games are actually played. He proposed that games, with their easily stated rules, were ideal for studying how folklore is expressed, performed, transmitted, circulated, and used.

Goldstein also pointed out that there are often important differences between the stated rules of games and the actual rules used by their players. As a result, he proposed, many studies of games may be based on inaccurate classifications. To illustrate, Goldstein described how children in a working-class neighborhood of Philadelphia played the game of counting-out. While commonly classified as a game of chance, many of the players Goldstein observed actually played it as a game of strategy. Among other things, they chose rhymes with different numbers of beats depending on the number of players or tagged on additional rhymes when the outcome was not the one they wanted ("My mother told me to...").

Following Goldstein, folklorist and developmental psychologist Linda Hughes has explored contrasts between game rules and the rules actually used by players (in Sutton-Smith, Mechling, Johnson, and McMahon 1994). She conducted a two-year-long ethnographic study of how one girls' play group played the game of foursquare (in Hollis, Pershing, and Young 1993:130–148), describing how social relationships influenced how players elaborated, interpreted, modified, and selectively ignored the stated rules of their game. She also described a way of competing among these players that differed in important ways from the individual competition specified by the rules of the game.

Several in-depth ethnographic studies of the dynamics of social life in particular play groups and children's understanding of their own games have been conducted on school playgrounds. Andy Sluckin focused on children's folklore in two English primary schools. In *Growing Up in the Playground* (1981), he described the games his children played, but also how they included and excluded each other from play groups, gained

entry into the game and particular game roles, started and resolved disputes, made and maintained friendships, and negotiated status in the play group and relations between the sexes. Folklorist Ann Richman Beresin (in Sutton-Smith, Mechling, Johnson, and McMahon 1994) conducted a yearlong ethnographic study of recess at an elementary school serving an ethnically diverse, working-class neighborhood in a large American city. Relying primarily on children's interpretations of videotapes of their own play, she explored the complex social worlds children construct on the playground and in their games.

There are also a number of in-depth studies of children's play and games outside of school settings. Anthropologist and sociolinguist Marjorie H. Goodwin studied the play of African American children in the neighborhoods of Philadelphia. In *He-Said-She-Said* (1990), she analyzed how boys and girls organize their play groups and games. In *Shared Fantasy* (1983), sociologist Gary Alan Fine explored the gaming culture of players of fantasy role-play games like dungeons and dragons. In *With the Boys* (1987), Fine examined the world of little league baseball from the players' perspectives.

City Play (1990), by Amanda Dargan and Steven Zeitlin, represents another type of contextual study of games. They used fieldwork and historical research in the neighborhoods of New York City to explore how the urban environment shapes, and is exploited for, play; how play has varied with class, ethnicity, and gender; and how it has changed with a changing environment and cast of players.

One of the most interesting issues in games study is how changes in society will affect children's traditional games. During the 20th century, children's play has been increasingly brought under adult supervision and direction and channeled into organized sports and recreation programs. More and more schools are shortening recess or confining it to children of the same age. Some are even proposing to eliminate it altogether. At the same time, safety concerns in many neighborhoods are limiting children's opportunities for spontaneous play and exploration, and television and video games are competing for children's time and attention. All of these ongoing changes in American society will continue to affect when, what, how, and with whom children play. What the effects will be, whether they will be positive or negative for children, and how they will further alter children's repertoires of traditional games remains to be seen.

Gardner, Emelyn Elizabeth (1872–1967)

Folklore collector and educator. Born in central New York state, Gardner devoted most of her professional life to teaching students at Wayne State University in Detroit, Michigan. Her pioneering work with immigrant folklore in urban Detroit is the foundation for the Folklore Archives at Wayne State University, which Gardner founded in 1939 with collections of Armenian, Italian, Polish, and Finnish lore.

Gardner became interested in the folklore of rural New York state through the tales told by a laborer on her father's central New York farm. Trained originally to teach high school, Gardner taught for five years in rural Schoharie County, New York. After receiving an A.B. from the University of Chicago in 1902, and inspired by the then-current literary approaches to folklore scholarship, Gardner returned to Schoharie County to collect its folklore. This material formed the basis for her master's thesis (University of Michigan, 1915) and was published in book form as *Folklore from the Schoharie Hills, New York* (1937).

Gardner joined the faculty at Ypsilanti State College; in 1918 she moved to Wayne State University, where she spent the remainder of her professional career. During her twenty-four years of teaching folklore and children's literature at Wayne State, Gardner inspired many students to pursue the study of folklore and to collect the folklore of their own communities.

Gardner's collecting has been lauded for its inclusiveness and scope. While criticized for the absence of some contextual information, her *Ballads and Songs of Southern Michigan* (1939), compiled with her student Geraldine Jencks Chickering, was noteworthy for its time for the addition of biographical information on informants and the thoroughness of documentation.

Gardner, Gail I. (1892–1988)

Cowboy poet, author of "Sierry Petes, or, Tying Knots in the Devil's Tail." Born in Prescott, Arizona Territory, Gardner attended Dartmouth College (1911–1914), then returned to Prescott, where he operated a small cow outfit until 1960. He served as postmaster of Prescott from 1936 to 1957.

His first poem, "The Sierry Petes, or Tying Knots in the Devil's Tail," was written in 1917 and set to music by fellow Prescott cowboy Bill Simon. It deals in a humorous fashion with an incident in which Gardner and another cowboy went into Prescott for what they later described as a "little whizzer," and met and subdued the devil on their way back to camp.

Gardner sang this song at an annual rodeo at Jimmy Minotto's ranch near Prescott in the 1920s. The next year, he came up with another original song, "The Moonshine Steer," concerning the difficulties a couple of cowboys had trying to work cattle after chancing

upon a hidden still and sampling its contents. For the next several years, a performance of a new poem by Gardner was an expected event at Minotto's gathering. In 1935, tired of writing his verses out for cowboys, Gardner published twelve of his poems in the booklet *OREJANA BULL for COWBOYS ONLY*. The seventh edition, published by the Sharlot Hall Museum of Prescott in 1987, was still in print in 1955.

Gardner always claimed to have written his poems solely to amuse cowboys. They continue to serve this purpose. "The Sierr Petes" is the best-known cowboy song among working cowboys, while several others of his poems have been collected from cowboy singing and recitation tradition.

Gay Men

A subculture comprising openly homosexual men of as many different tastes and interests as mainstream American culture. Folklorists have published little research on the traditions of gay men. In addition to conducting fieldwork, people interested in pursuing gay folklore as a research topic must glean corroborative examples from studies in history, sociology, cultural anthropology, and other disciplines—like Esther Newton's *Mother Camp: Female Impersonation in America* (1972)—as well as from such works of gay fiction as Armistead Maupin's *Tales of the City* series (1978–1990).

Despite the risk of overgeneralizing, one can make certain broad statements about gay men's folklore. First, the gay subculture shares many of its traditions with White male culture, not surprising since ethnic groups are represented in the gay subculture in the same proportions as they appear in the mainstream.

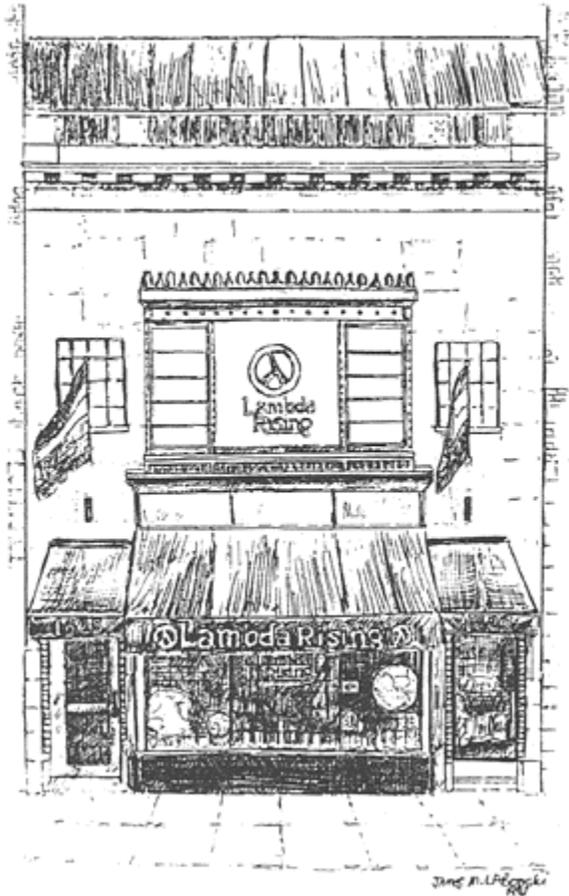

Gay folklore exists in most genres—jokes, narratives, contemporary legends, beliefs, proverbs, folk speech, customs, costumes, arts and crafts, and so on. (There is also evidence of a defunct folksong tradition in the sung lines, "God save us nelly queens" and "Wait 'til your son turns nelly!") Distinctions between genres are sometimes difficult to make when one is studying gay folklore, especially because humor suffuses almost all of the material. In addition, the gay subculture has developed at least two genres of its own—drag, or female impersonation, and camp.

Camp, as described in the only book-length study of gay men's folklore, "is an attitude, a style of humor, an approach to situations, people, and things...assertively expressed through exaggeration and inversion, stressing form over content, deflating pomposity, mocking pretension, and subverting values" (Goodwin 1989:38–39). For example, in the early 1980s, a folder in the vertical file labeled "Homosexual Drag" at the internationally renowned Alfred C.Kinsey Institute for Research on Sex, Gender, and

Reproduction at Indiana University contained a flyer announcing the Miss Gay Philadelphia Drag Ball and several programs for the Vienna Boys Choir. Whoever slipped the programs into the folder was implying by this camp gesture that the choirboys were gay and in drag, mocking the presumed sweetness, innocence, and purity that the public associates with the young singers.

Gay men's traditions differ from mainstream folklore in several ways—most notably, where performances occur, the strategies for which the items are used, and the themes contained in the material. Because homosexuality has for centuries been reviled in Western societies, gay men have been forced to meet clandestinely. As a result, most gay men restrict their use of overtly gay traditions to private settings such as gay bars and parties in people's homes. Some larger cities have gay neighborhoods in which performances are more open. Because of its highly esoteric nature and its frequent reliance on ambiguity, much of the folklore of gay men can function for identification and communication in nongay settings.

Gay men can use their jokes and other esoteric references to suggest their homosexuality to one another in public. Gay folklore also functions to help maintain group cohesion within

the subculture and to cope with conflict, both in gay society and between the gay and straight worlds. The following joking exchange illustrates these functions:

Mv mother made me a homosexual.

If I get her the yarn, will she make me one, too?

Freudian psychoanalytic theory maintains that homosexuality is caused by a distant father and a dominant or closebinding mother. These two lines play with that notion, suggesting also that homosexuality is a status to be desired.

Gay folklore often has sexual overtones. This quatrain can serve as a humorous cohesive device or as a potential “pick up” line:

Friends may come, and friends may go,
 And friends may peter out, you know,
 But I’m your friend through thick or thin—
 Peter out, or peter in.

In addition, gay men may use their traditions publicly to defy their oppressors and to express contempt for heterosexual society. Oppressed groups often invert traditions that their enemies have used against them in this way. Thus, an activist group has assumed the name Queer Nation. Gay men and lesbians are increasingly demonstrating and chanting, “We’re here! We’re queer! Get used to it!” The subculture has coopted the hateful word “queer,” imbued it with pride, and hurled it back in the face of the oppressive mainstream.

Gay folklore addresses many themes of concern to gay men. In addition to expressing group membership, defiance, and pride, the traditions express fears, fantasies, friendship, and much more. The racism and sexism of the straight world are also reflected in gay men’s folklore. Frequently, the underlying theme is power—either having it or being subjected to it. Just as sexism and racism—regardless of the sexual orientation of the person using the material—are expressions of one’s presumed power over someone else, so inversion is an attempt to reclaim power that oppressors have tried to claim as their own.

Gay folklore is a rich area for research. In addition to much-needed studies of a general nature, such topics as the folklore of people with multiple oppressions (being gay and African American, or deaf and gay, for example), the folklore of AIDS (both esoteric and exoteric), and the folklore of younger gay men, who have come of age during the plague years (that is, during the AIDS epidemic), await the attention of folklorists.

Much of the folklore of AIDS, for example, comprises legends and rumors about the origins and transmission of the HIV virus assumed to cause acquired immune deficiency syndrome. The various AIDS jokes that circulated widely during the 1980s were primarily heterosexist jokes aimed at the gay male subculture. (The jokes had a brief circulation among gay men as well.) An exception is the following:

Do you know what the most difficult thing about having AIDS is?
 Trying to convince your mother that you’re part Haitian.

(Soon after AIDS was “discovered,” the Centers for Disease Control included Haitians with gay men and intravenous drug users as the primary groups at risk.)

This esoteric joke addresses the anxiety of coming out to one’s family and friends, a prospect potentially more frightening than enduring a devastating terminal illness.

Such traditions offer insights into the lives and concerns of a substantial segment of American society. A rich field awaits those willing to venture into it.

Gayton, Anna Hadwick (1899–1977)

Anthropologist and folklorist who played a major role in compiling and analyzing California Indian mythology. Born September 20, 1899, in Santa Cruz, California, Gayton served as book review editor for the *Journal of American Folklore*, as vice president of the American Folklore Society, and was elected its president in 1950. In addition, she made significant contributions in the areas of textile research, California ethnography, and Peruvian archaeology.

All of Gayton's higher education was taken at the University of California, Berkeley, from which she was the first woman to receive a Ph.D. in anthropology, in 1928. Her dissertation dealt with the narcotic plant *Datura* and was written under the direction of Professors A.L.Kroeber and Robert H.Lowie. She also carried out extensive ethnographic research between 1925 and 1930 on the Yokuts and Mono of the southern San Joaquin Valley, and published nine essays between 1929 and 1948 dealing with Yokut and Mono myth and oral tradition. In her monumental "Yokuts and Western Mono Myths" (coauthored with Stanley S.Newman), Gayton provides a thorough synopsis and in-depth analysis of 214 myths and tales, 55 of which had not been published previously (Gayton and Newman 1940). Her treatment is notable for its keen attention to narrative styles.

Gayton married anthropologist Leslie Spier in 1931. She followed Spier in his teaching career at Yale University and the University of New Mexico and did not resume her own professional career until 1948, when she was recruited to fill a position in the Department of Decorative Arts at Berkeley. During her tenure at Berkeley, Gayton published numerous articles on textile analysis and worked to further the University of California folklife program. She was a pioneer advocate of comparative folklore studies. In "Folklore and Anthropology" (presented in 1946 and published in 1947), she cogently argues that American folklorists should look beyond American Indian myths to include Oceanic, African, and Asiatic myths, and should undertake comparative, analytic studies on already collected and published materials (Gayton 1947). For Gayton the greatest need was for research on the roles of myth in all cultures. In terms of her own folklore research, Gayton's various studies of religious festivals celebrated among Azorean Portuguese in Gustine, California, are a major triumph. Toward the end of her Berkeley career, she conducted primary research in Gustine and the Azores, publishing three important essays on the Festa da Serrata (cf. Gayton 1948). In her last publications, she carefully chronicles the creation of ritual and sacred space and provides a pioneering discussion of the impact of culture and tourism on living folk traditions. Gayton died on September 18, 1977, in Santa Cruz.

Gender and Folklore

The traditional cultural expression of maleness and femaleness. In folklore, gender is expressed in interpersonal, familial, and communal behavior; public and private ritual; speech and song; music; foodways; costume; vernacular architecture and domestic space; and religious and other forms of belief (medical, political, and the like). Men and women may have particular physical attributes that distinguish them as human beings, but their biological forms are not the sole constituents of their gender. Gender also consists of the social construction of sexual identity within a particular cultural context. Categories of gender are culturally defined, shaped, and imbued with significance and sets of expectations. Gender, therefore, is a central organizing category for experience; it emerges at various times and in various situations as a salient marker by which people identify themselves. It is one of the basic ways in which people encounter and interpret the world as individuals and differentiate community membership.

Folklore, as the expressive elements of a culture, not only manifests, but also helps construct and determine rules, behaviors, and ideas within particular cultures relating to men and women's sense of themselves and their interrelationships. Specific folkloric activities can be recognized as distinguishing markers of gender within a given culture. In fact, expressive forms (for example, speech acts, material culture, and customary behavior) are almost always particularly gendered. In the United States, midwifery, women's laments, quilting, gossiping, foodways, altar making, narrating personal experiences, ballad singing, egg decorating, experiencing Marian apparitions, recounting prophetic visions of Mormon women, and private home liturgizing are often considered by both the general public and folklorists as spheres of American female creative activity, while the occupations and lore of lumberjacks, firefighters, truck drivers, policemen, race-car drivers, cowboys, and rodeo riders; *fraktur* painting; "hex"-sign painting; decoy carving; ship building; stone and wood carving; fox hunting, joke telling; preaching styles; toasting; and "doing the dozens" are usually perceived as spheres of American male creative activity.

In American society, gender roles are reinforced by various forms of cultural expression, including television, radio, cinema, theater, music, newspapers, magazines, and billboards. The roles that American culture generates and reinforces create a situation of single-sex, specifically male, domination through idealized notions of gender. Historically, there has been resistance from women to these idealized roles. The feminist movement in North America has called attention to what women consider male dominance and an androcentric perspective within everyday life and academic scholarship. In an effort to equalize the power available to both sexes and to bring women's voices into public discourse, gender scholars have launched a critique of the role of gender in American culture. Gender for them is located fundamentally within a set of power relations. This critique has led folklorists to a greater consideration of the potential of gender as an identifiable, defining and analyzable category in their fieldwork.

Feminist folklorists have argued that patriarchal structures, hegemony, and pedagogical agendas, all informed by gender, have facilitated the exclusion of specific expressive forms from the discipline. Studies of femininity and masculinity and hierarchies within occupational, leisure, religious, family, private, and public culture have led to a reevaluation of the field of folklore and folklife as informed by a new conceptualization of gender. This new scholarly orientation has led to an expansion of what should be considered significant forms of folklore. For example, gossip, which was once considered a trivial and insignificant feminine speech act, has been recognized by folklorists as a uniquely female collaborative device in women's everyday lives as opposed to male hierarchical ways of speaking. Additionally, the personal-experience narrative has also been identified as a gendered form of communication in America, meaning that within this genre, first identified in the 1970s, there are male and female ways of communicating such narratives. While men tell stories that bear similarities to "tall tales" told for entertainment value, women's personal-experience narratives are told for instructional purposes.

Work has also been done on the contestative potential within the traditional religion of Pentecostal women pastors in the Midwest. These women use their skills of oral performance to outline their "calling" to serve the community as pastors. This presentation of self allows them to break with the traditional admonition of fundamentalist Christianity that women not concern themselves directly with church affairs. These women are wresting religious power from a socio-religious context that traditionally denies their full participation. As such, their activity is a criticism of that order and its culture of denial to women. It is also, strangely enough, a confirmation of the spirit of Pentecostalism, because these women, as living exceptions to the rule, possess both an ability and the blessing from their God to preach and be pastors to their communities.

Within the folklife of the American people, there are identifiable traditions that dichotomize gender, creating standards of culturally expected behavior for men and women. Specifically, within ritualized life-cycle events there are clear expectations about gender roles. A rich example of the social

and cultural reinforcement of gender can be found within traditions surrounding American wedding ceremonies. The cultural construction of gender can be seen in the “customs” that surround public and private marriage events. Traditionally, the participation of the bride’s family and the groom’s family is shaped by gender, and it reflects the expected “roles” of the marrying couple. Throughout the planning of the wedding, various sources such as family members, clergy and other religious professionals, etiquette books, and “bride magazines” are influential in providing details regarding expected cultural behaviors. The serenading by the groom on the eve of the wedding, the duty of hosting the rehearsal dinner, the “dollar dance” with the bride at the wedding reception (where a guest gives a dollar to the bride in exchange for a dance), the

cutting of the cake, the throwing of the bouquet, and removing the garter from the bride are traditions specific to the American ethnic wedding that are focused on a particular gender. Within religious wedding rituals, there remains in American weddings a strong emphasis on gender and cultural expectations that were received from various regional and ethnic bridal customs. For example, based on European Christian bridal custom, often the father of the bride or a close male relative “gives away” the bride, walking her down the center aisle at the beginning of the religious ceremony in the church and giving her at the altar to the man who is to be her husband. In traditional Roman Catholic ceremonies, the bride can also be presented to the Virgin Mary at her altar while the congregation prays for her to be a good wife and mother.

Another traditional activity associated with customary gendered behavior and “folk” religion in the United States is the creation by women of “holy corners” and home altars as places of honor within the domestic environment. Within the Christian tradition, this custom has been particularly associated with women as they create a site in their homes for intercessory prayer. On a covered table, in a nook, or even on top of a television set, through an assemblage of religious images such as mass-produced small prints, self-made and decorated images, statues, rosaries, photographs of loved ones, flowers, and votive candles, the woman expresses the vitality of her faith and its connection to her family and community life. Home-altar building, however, is also a significant aspect of American religious life outside of the Christian context, as demonstrated, for example, by the practices of contemporary paganism and witchcraft, or Wicca. In these cases, both women and men independently construct their own sacred spaces for spiritual and ritual purposes, assembling them from a variety of perceived religious objects from nature, family, and the cosmos. There is a quality to these sacred spaces specifically relevant to the gender of the creators. Still, the activity of creating altars from an assemblage of unrelated objects is not gender specific, but is an expressive form shared by both men and women.

The activity of making something out of nothing takes place for both men and women in the private as well as the public sphere. For example, evidence of a male public folk aesthetic has been observed by folklorists in the craftsmanship of the community of Italian American stone masons who built and decorated many of the public buildings found in the United States. Stonecutters, stonemasons, and woodworkers are all excellent examples of men engaged in the process of producing public artifacts, the skills for which have been passed on to them because of their gender. Men and women, consequently, have access to different traditions of information based on their gender. Men traditionally take apprenticeships to carve stone, lay bricks, and fit pipes, while women are traditionally taught to embroider in the home, or learn to roll pierogies within the context of the Slavic American parish community.

The community or public emphasis of women’s creative activity is manifest most clearly in foodways in the United States, where the production and consumption of food is often organized in gender-specific ways. Foodways is a realm of activity traditionally associated with female culture. Oriented toward the family and community, women are socialized to express their creativity, status, and location in the household through the medium of food. Gender roles can be seen at the center of the home economy and relate directly to the division of labor within it. For example, in a *Tejano* (Mexican Americans in Texas) migrant-worker community, women call on the financial, familial, cultural, and

social resources of their community to prepare a labor-intensive meal of tamales for their husbands. The activity of producing volumes of tamales as a community of women reinforces family ties and simultaneously affirms the identity of this

community as an ethnic group in the United States.

A problematical aspect of the folkloristic study of gender has been discerning those less clearly defined occasions of traditional cultural activity in which both genders participate. Some spheres of creativity are very clearly defined while others are fluid, shared by each gender, and engage each other in a dialogue of sorts. Urban legends, rap songs, recitations, joking, cross-dressing, tattooing, body piercing, graffiti, photocopied and computer-based texts, and other forms of traditional and contemporary folklore are being perceived in a new light. For example, customary behaviors such as male “stag” parties are mirrored in the bachelorette parties and “Chippendale Clubs” (in which male exotic dancers perform) that emerged in the 1970s in response to, and as the counterpart of, the traditionally male bachelor party. Similarly, shared forms of gendered socializing are found in leisure occasions at college and university fraternities and sororities at which lengthy repertoires of drinking songs are circulated, the content of which is often explicitly sexual.

Any consideration of folklore forms shared by men and women necessitates the consistent questioning and deconstructing of traditional gender dichotomies that are continuously present in the American experience and interpretation of reality. A primary example of blurred gender and sexual boundaries can be found in the complex culture of the American gay and lesbian community. This community tests the limits of America's understanding of gender expectations by engaging in expressive forms of speech, dress, action, and body movement that traditionally have been assigned by members of the opposite sex to each other. Gay men accentuate specific qualities associated with male gender roles especially in social contexts where they encounter other gay males, such as a "leather" bar. They can also invert such masculinity and denigrate feminine qualities through the use of camp behavior. A particularly rich example of the blurring of gender boundaries can be found in the American gay and lesbian community's support of the Names Project/AIDS Quilt. The creation of this quilt to commemorate those individuals who have died because of acquired immune deficiency syndrome (AIDS) involves the participants in an activity commonly recognized as a female domain—quilting. The quilt purposely creates a memorial primarily for men that is transient in nature. The organic nature of the quilt perfectly accommodates the potentially unending numbers of deaths of community members from the disease. In this case, a gendered sphere was borrowed by a man, Cleve Jones, using a female expressive form to memorialize and personalize the loss of life. The medium of this memorial tests the expectations Americans may have about the materials used, the stability of location, and the accessibility of a memorial to Americans who have died in a battle. As the number of AIDS deaths has grown, the quilt has changed to represent males and females, homosexuals and heterosexuals, with gender being superseded by the experience of disease.

The intersection of other markers of human identification such as race and class with gender has emerged as problematic for the contemporary folklorist. The folkloristic representation of a group simply on the basis of gender is difficult if not impossible because of the possibility of these other factors influencing and even superseding gender. Fieldworkers are increasingly aware of the difficulty of representing people even if they share the same sex or sexual orientation. The Fieldworkers' academic status naturally infringes upon folklorists' ability to represent individuals and groups who are in subordinate positions of power. Gender is inextricably linked to the power differentials within a particular culture because gender involves the process of defining men and women. Understanding who dictates that process and how it is worked into the everyday lives of men and women is especially important for folklorists and all individuals working on the culture of everyday life. The lesson of the feminist critique that women's lives have been erased in past scholarship and need to be rediscovered and celebrated through ethnographic research does not mean that men's lives are adequately characterized by patriarchal stereotypes. The care that needs to be given to the study of women's lives and folkloric expressions needs also to be lavished on male culture and male folklore and folklife to prevent an unreflective view of what actually constitutes the uniqueness of that culture.

Gender-specific and overtly gendered folklore forms seem to occur within the realm of material culture and "activity" more than in the domain of oral expressive forms. While the content of the jokes, stories, and songs told by men and women often differs, the divergence of genders within material objects of folklore is more clearly defined. Perhaps

in the right context, a man or a woman might perform an oral genre, or have knowledge of an oral genre, regardless of his or her gendered “right” to perform it in the public or private sphere. However, creating physical evidence of experimentation within a gendered sphere of activity to which one is not culturally privileged, such as whittling, quilting, or beadwork, may often be deemed too risky for it may raise issues of gender competency, critique, and ownership. Consequently, the material genres maintain their gendered status and characteristics over time.

It is impossible to consider American folklore and folklife, its form, function, or meaning, without reflecting on the role of gender. The production, maintenance, and transmission of various American folklore forms are gendered. The ways in which cultural expectations are constructed and fulfilled speak to the ideology of gender that communities and individuals create and transmit. Within the North American context specifically, a process of experimentation about gender that is potentially both radical and destabilizing has been taking place throughout the 20th century. Folklore forms have often represented the crossing of traditional gender lines. The future of American folkloristics in the study of gender lies in exploring the ongoing deconstruction of gender boundaries and their reformation along new paradigms of male and female identity and senses of self.

German Americans

Descendants of the largest U.S. immigrant group. The long history of German settlement in America reflects centuries of religious, political, and social turmoil in the German-speaking countries of central Europe. The Protestant Reformation generated a number of fervent religious movements throughout Europe, led by those who believed that Reformation leaders had stopped far short of true reform. The rise of the Anabaptists in the 16th century, and the Pietists and Radical Pietists in the 17th and 18th centuries, demonstrated a pervasive longing in post-Reformation Europe for religious freedom. After the Augsburg Accord of 1555 gave the princes of the provinces and the governments of the free cities the right to introduce the Reformation into their territories, religious choice had remained in the hands of the rulers of the patchwork of small principalities and kingdoms that constituted Germany. While not actually stated by the accord, “whoever rules determines the religion” became the established practice,

causing continuing unrest as mystics, visionaries, and intellectuals rebelled against the rigid conformity enforced by the established churches and governments. Religious persecution, political oppression, heavy taxation, and compulsory military service led to massive German emigration during the 18th century, both to the east (to the Russia of Catherine the Great) and to the west (to the “New World” with its promise of freedom and opportunity).

The Napoleonic Wars and a series of failed revolutions led to another surge in German emigration in the first half of the 19th century, both to Russia, where Wuerttembergers and others established the Black Sea colonies at the invitation of Czar Alexander I, and to America, where immigrants began to move west with the frontier. Promotional literature and letters home promised free or cheap land in the “Far West,” low or no taxes, and an absolute freedom undreamed of in Europe. A wave of “Amerika-Fever” swept Germany, and stories of hardships and failed plans did little to discourage those who saw America as the answer to worsening problems of overpopulation, poverty, and oppression at home.

In 1608 German glassmakers had been among the first group of non-English brought to the Jamestown Colony by the Virginia Company. Conflicts with the English settlers soon developed. Apparently dissatisfied with conditions in the colony, the German craftsmen, with a Swiss, joined with the American Indian chief Powhatan, leading Captain John Smith to coin the “damned Dutch-men” epithet (based on the mispronunciation by English speakers of *Deutsch*, or German) that was to echo in broadsides and songs during both the Revolutionary and Civil Wars. Later in the 17th century, as the vision of America became more firmly rooted in the European imagination, individuals or small groups of Germans began to settle along the East Coast. The first permanent group settlement in America was established in Pennsylvania in 1683, when German Mennonites and Quakers from the Lower Rhine established Germantown. During Queen Anne’s reign (1702–1714), the British government promoted German immigration, and Germans continued to arrive in increasing numbers during the first half of the 18th century. Benjamin Franklin, who had established a German newspaper in 1732, was complaining by the 1750s that Pennsylvania was becoming a German colony. At the outbreak of the Revolutionary War, a third of Pennsylvania’s population was German, and substantial settlements had been established in Georgia, Maryland, the Carolinas, New York, and elsewhere.

Throughout American history, political and religious refugees from Germany have had a substantial impact on the cultural, political, and social development of their adopted country. With the support of the large numbers of immigrants who left home for purely economic reasons, German intellectuals, religious leaders, and exiled revolutionaries have at times been able to gather enough political power in many states to affect local and national affairs. *Turnvereine* (athletic societies dedicated to the principle of “a sound mind in a sound body”) were established in Germany by Friedrich Ludwig Jahn after the defeat of Prussia by Napoleon in 1806. Brought to the United States by former revolutionaries, particularly the “Forty-Eighters” (often university-educated intellectuals who participated in the 1848 revolutionary movements in Germany and, as a result, had

to flee to avoid prosecution and imprisonment), Turner societies became convenient vehicles for organizing political action as well as providing athletic and cultural activities. The power German immigrants gained, their great numbers, and the tenacity with which they held to their language and social customs have often been viewed with alarm by other Americans.

The concept of the "melting pot," Michel Guillaume de Crèvecoeur's vision of Americans as individuals of all nations "melted into" a new race of men, has been fixed in the national political consciousness since colonial times and has continued to pervade American political rhetoric, particularly during times of national crisis. However, most German immigrants came to the United States not to assimilate into another culture but to have the freedom to practice the religion of their choice and preserve for their children the language they treasured. They established churches, schools, newspapers, and organizations toward that end.

Historic events sometimes beyond their control have not made their Germanness easy to accept. The use of impressed (and often kidnapped) young Hessian men by King George III to put down the rebellion in the American colonies inspired numerous revolutionary broadsides and songs about the "Hessian mercenaries." Even during the Revolutionary War, however, as they were to do later, Germans presented a dilemma for patriotic-song makers. On the one hand, there were many who fought against the British, including General Nicholas Herkimer and his four battalions recruited in New York's "German Flats." On the other hand, there were the fearful Hessians. Versions of the broadside "Saratoga" include both salutes to "Herkimer's brave soldiers" and complaints about British General John Burgoyne's German troops: "To plunder and to murder was solely their intent." The "Song of the Vermonters" with its anti-German sentiment, published anonymously but finally acknowledged by John Greenleaf Whittier, persisted in the oral tradition in New England for a century and a half, as ballad collector Helen Hartness Flanders found.

The terms "Hessians" and "Dutchmen" were revived by Civil War song makers and lingered in the folk memory through the second half of the 20th century. German participation on the Union side was substantial, and Northern songs celebrated "the loyal sons of Germany," while Southern broadsides raged against the "hireling Hessian knaves" and the "bloody Dutch." Even the pro-German Civil War broadsides had a tendency to satirize German accents, food preferences, and an affinity for lager beer ("I Goes to Fight Mit Sigel," "De Goot Lager Bier").

Following the Civil War, the German practice of the "Continental Sabbath" continued to offend many Anglo Americans, and a movement to prohibit theater performances and other social activities enjoyed by Germans on Sunday inspired "blue laws" to bring Germans into step with their neighbors. It was the German affinity for wine and beer, their concept of the tavern as a center for community and family activities, and their enthusiastic celebrations of holidays, both their own and American patriotic holidays, that most often brought them into disfavor with their English neighbors. "The Hell Bound Train," collected by Vance Randolph in the Ozarks, expresses a prevailing view in many areas: "The tank was full of Lager beer/And the devil himself was the Engineer." As World War I approached, supporters of Prohibition reminded voters in southwest Missouri that a vote for Prohibition was a vote against the Kaiser, and state Councils of Defense set out to abolish "enemy languages" in churches and schools.

The degree to which German immigrants and their descendants assimilated into the mainstream American culture at various times is a matter of dispute among cultural historians. Acculturation did, of course, take place even in the areas with the heaviest German population. New German immigrants to Pennsylvania in the 1830s, imbued with the romantic notion then prevailing in Germany that everything characteristically German ought to be preserved, were so offended by the Americanization of the old immigrants in Philadelphia that they formed a German Settlement Society to establish a colony in the West that would be “German in every particular.” Naming the planned colony Hermann for the old Germanic hero who had defeated the Roman legions in the Teutoburger Wald in A.D. 9, and with streets and sites for churches, promenades, and parks already in mind, society members moved to an isolated site on the Missouri River 80 miles west of St. Louis. For many decades, from the 1840s to World War I, they were able to achieve their dream of a Golden Age of German culture in America, with German churches and schools, musical groups, a theater, and a thriving wine industry that inspired a succession of festivals and celebrations.

Whether articulated, as with the founders of Hermann, the leaders of intentional communities, and such ambitious groups as the well-educated members of the Giessen Emigration Society, whose aim was to establish a German state in the Far West, or simply as a matter of course, German immigrants proceeded to cluster into settlements and enclaves of their kind (“herding together,” as Franklin had said) and began transplanting their language and cultural habits to the new environment. This did not simply mean German, but Bavarian, Westphalian, Rhinelander, or Hannoverian. The strong local folk tradition and local pride that survived German unification under Bismarck (and continues to thrive) was maintained in the United States and resulted in numerous benevolent, musical, and social clubs in urban areas based on provincial origin. Chain migration led to rural settlements of immigrants from the same area who preserved their regional customs and dialects for generations. The language they spoke was central to their identity. Most communities maintained their dialects as the “social” language, although High German was used in the churches and schools. As new immigrants arrived in established communities throughout the 19th century, language and traditions were reinvigorated and became more firmly entrenched. This massive and continuing immigration served to transplant a multiplicity of German religious and traditional practices in many parts of the United States. The arrival of the “Germans from Russia,” Catholics, Lutherans, and Mennonites, who began to emigrate after the American Civil War when Czar Alexander II instituted universal conscription, brought to the Plains states old beliefs, customs, and practices preserved for almost 100 years in Russia. Healing and magic practices, songs, and sayings took root in many isolated communities.

Ironically, religious controversy among the Germans continued in America as new groups arrived and new churches were established. George Rapp’s Harmonists, who came to Pennsylvania from Wuerttemberg in 1804, moved to Indiana in 1814, and went back to Pennsylvania in 1824, and suffered a Great Schism in the 1830s when some Harmonists followed the charismatic Count Leon to Louisiana and some went with Wilhelm Keil to Missouri. William Nast, founder of the German Methodists, was stoned by his compatriots in Cincinnati when he preached his new faith, and traditional Lutheran and German Reformed Church leaders protested the formation of the evangelical *Kirchenverein des Westens* on the Missouri frontier, ridiculing its leaders and launching

personal attacks on its pastors in St. Louis newspapers. The Germans from Russia formed their own churches and held tightly to their own customs, partly because they were not welcomed by other German Americans.

The class system caused some difficulties among early immigrants, but often the “bond of common memories” from home, seemingly always stronger than the bond of common American experience, overcame the class distinctions. In many towns in the Missouri Rhineland, the doctor, lawyer, butcher, baker, and their wives and children took part in the German theater performances sponsored by the *Turnverein* or other societies. The Turner societies generally became less political after the Civil War period and sponsored diverse cultural and social events such as poetry readings, theatricals, and concerts rather than military drills. Athletic competitions continued, but in the 1990s some Turners report that about the only exercise at meetings is bending the elbow. In 1995, about eighty Turner societies still existed.

The customs maintained most faithfully by German Americans were church and family centered. Both Catholic and Protestant groups preserved pre-Lenten, Easter, and Christmas traditions into the 20th century: *Wurstjäger* (sausage hunters) sang Rhenish begging songs current in early-19th-century Germany when they went out to collect food for the community pre-Lenten feast in American communities. In Protestant communities, children went from door to door begging for *Fettküchli*. Easter was celebrated with both religious ceremony and bonfires. Holy palms are still placed in homes as a protection against lightning. St. Nicholas Day was celebrated primarily by Catholic groups, who transplanted different customs from various provinces in Germany and Austria to settlements in America. On December 6, St. Nicholas visited homes in rural Catholic communities accompanied by “Black Peter” or the devil in chains. It was an experience that not many adults recalled with pleasure, accompanied as it was by the rattling of chains and the frightening prospect of recalling a year’s transgressions. In communities where St. Nicholas did not actually appear, children put out their shoes with gifts for the expected visitors. Sometimes curious adaptations and confusions of customs occurred. In a German community in south Louisiana, children put out rice for Santa’s reindeer on December 6. In the Bethel colonies in Missouri and Oregon, a tradition of a Black Santa developed, and on Christmas Eve in some communities children were visited by the *Christkindl*, a female figure. The *Christkindl* in affluent St. Louis homes was considerably more benevolent than the stern Kris Kringle who visited Bethel. The custom of wedding inviters, who composed invitations in German verse to recite at neighboring homes, was one of the folk traditions that persisted in many rural communities. Those who accepted the wedding invitation pinned a ribbon on the inviter’s staff or jacket and provided him with the expected refreshment. *Maifeste*, *Schützenfeste*, harvest celebrations, and “Shooting in the New Year” were a part of pre-World War I German American community life and were sometimes revived after the War. A *Schützenverein* in eastern Missouri held its competition, crowned its king, and enjoyed the customary ball into the 1950s.

The book burnings, vandalism, and attacks on German Americans during World War I served to diminish the use of their language in public and curtail the exuberant festivals, but such actions did not extinguish them altogether. The events of the 1930s and World War II led to a further diminution of public cultural activities, but family and sometimes community customs continued. The American Bicentennial in 1976 and the celebration

of the Tricentennial of German group settlement in America in 1983 encouraged a revitalization of the German American spirit, but language barriers continue to discourage the kind of extensive collection and study of German folklore that resulted in the preservation of major collections of African American and Anglo American folklore in the early 20th century. Only in Pennsylvania has German folklore been consistently collected, published, and studied, although the Germans from Russia, both the Volga River and the Black Sea groups, have extensively documented their history and folklore since World War II.

Yet, in many areas of the United States, the influence of German immigrants can be seen in the distinctive churches, townscapes, and farm buildings that remain. Early communal and other intentional settlements have been preserved, often as tourist attractions, and serve as reminders of the long history of the search for religious freedom. German foods, which once inspired satire, are part of the American diet, and many holiday customs, including the Christmas tree and Christmas music, have been adopted by all Americans. More language has been lost than is remembered, but newly established Low German Theater performances draw large local audiences, and singing societies are still popular in the cities. Many German American communities are trying to preserve, revitalize, and promote their German heritage, often with such activities as "Wunderbar Days," "Gesundheit Festivals," and *Strassenfeste*. *Oktoberfeste* and *Wurst* (sausage) festivals attract German Americans and others for traditional food and drink. German Americans are still perceived as Germans and perceive themselves as German. As the 20th century nears its close, they make up almost one-fourth of the U.S. population.

Gerould, Gordon Hall (1877–1953)

Medievalist, litterateur, folklorist. Born in Goffstown, New Hampshire, Gerould was educated at Dartmouth College (A.B. 1899) and Oxford University (B.Litt. 1901). In 1901 he was appointed reader in literature at Bryn Mawr College; in 1905 he was named preceptor at Princeton University, where in 1938 he became Holmes Professor of Belles Lettres and from 1942 to 1946 he served as chairman of the Department of English.

He was a member of the Medieval Academy and also served as a vice president of the Modern Language Association of America.

Known to folklorists primarily through two of his books—*The Grateful Dead: The History of a Folk Story* (1908) and *The Ballad of Tradition* (1932)—he taught the full range of English literature and published a definitive study of saints' legends (Gerould 1916), translations of *Beowulf* and *Sir Gawain and the Green Knight*, as well as *How to Read Fiction* (1934) and *The Patterns of English and American Fiction* (1942). He also published four novels.

The Grateful Dead served as a model for folktale study among students of literature and was influential in the development of the "historic-geographic" school of folktale study. *The Ballad of Tradition* was the first explicit statement of the theory of communal re-creation, and for four decades it served as a substitute for the introduction that Francis James Child never wrote to *The English and Scottish Popular Ballads* (1882–1895). It remains the most influential of all introductions to the ballad genre.

Gestures

A metalanguage with distinctive features, categories, and functions. The story of the man who would not be able to talk if he could not use his hands is no joke; gestures are essential in communication. When a multilingual person switches from one spoken language to another, the accompanying gestures switch also. Even within the same language, gestures vary according to context. Gestures used at a church differ from those used at a bowling alley.

Gestures are made by articulating body parts, including limbs, torso, and face, in isolation or in combination. Gestures are shaped by four dimensions—three spatial extensions plus time—textured by varying dynamics. Though fleeting, gestures' impact exceeds the time of execution. Gestures linger in the "mind's eye" of the receiver and remain within the human transmitter in neurological, chemical, and cognitive ways that are not fully understood. Gestures are kinesthetically sent but visually received. As ideas are often clarified to both the listener and the speaker when they are spoken aloud, so information and feelings are confirmed to both viewer and performer when they are embodied in gestures.

The shapes of gestures are partly delineated by apparel, paraphernalia, and environment. In some transplanted European and Mexican folk dances, women gesture decoratively with their arms while their fingers grasp their skirts. The skirts and held objects such as rattles are gesture modifiers. Gestures by hands that hold or manipulate items differ from those of unencumbered hands. Bare or shod feet with, say, slippers, boots, or sandals, differentially define the kinds and qualities of leg and foot gestures. Likewise, whether the ground space is hard floor or soft sand affects leg and foot gestures.

Most gestures are learned. Involuntary gestures, shared universally with all human beings include grinning, flailing, flinching, shielding, jerking, and empathic mirroring. They are comparable to vocalics of laughing, babbling, grunting, whimpering, squeaking, or imitative echoing.

All humans share the same potential for gestures, just as all humans are capable of uttering the same sounds, but the range of gestures and vocalizations is species specific. When selected, codified, and habituated, gestures and vocalizations are culture specific and comprise a repertoire (with idiosyncratic flavorings). Even ad hoc gestures adapt movements from the repertoire.

Gestures bridge the mind-body dichotomy. Gestures reinforce, augment, give nuances, sometimes supplant, even occasionally nullify oral language. If someone says, "no," but simultaneously nods affirmatively, the gesture prevails. The cliché that actions speak louder than words, thus, has credence.

A constant in human life, gestures are incorporated in both ordinary and extraordinary experiences. Although all gestures are meaningful in some way, their intent differs. They can express emotions or be emotionally neutral. They can perform tasks or be useless. They can emphatically communicate or phatically conform. They can be spectacular or

taken for granted. They can be significant by their very existence or in the breach. Gestures can energize or be wasted. They can establish or remove boundaries. Gestures can be communal, private, or intimate. Whatever their reasons, they are part of all human life at all times.

Gestures function variously as signs, signals, symbols, and signatures. Gestures can serve as punctuation, such as raised eyebrows to indicate a question. Gestures can reinforce an idea. For example, raising the first and middle fingers to form a “V” signifies “Victory;” lifting only the middle finger is a vulgar insinuation. Gestures can even evoke the unseen or invite metaphysical intervention, such as lifting both hands above the head with the palms facing up to invoke a heavenly blessing, or crossing the first two fingers or knocking on wood for luck and protection.

Vocational gesture idioms reveal identity while affecting the course of action, such as signaling in the stock exchange, at auctions, by umpires at baseball games, or by train conductors to move trains. The latter is an example of changing gestures, because walkie-talkies have replaced hand gestures and the swinging of a lantern.

Idiosyncratic gestures, such as nervous habits of finger tapping or hair twisting, can become signatures of an individual. Sometimes symbolic gestures are restated in other media. For example, in some dances Hopi male dancers hook their fingers over the uplifted curved fingers of the dancer on either side, a gesture that expresses brotherhood. That gesture is graphically replicated by hooked half circles drawn on a dancer with body paint.

Whether or not a gesture consciously communicates, it can be “read,” but only by those who are literate in the gesture code. For example, a Midwestern Euro-American who asks a Southwestern Native American where something is may be perplexed or even insulted when the Native American protrudes his lower lip in reply, a traditional way to point.

The smile is a universal human facial gesture, but the meaning ascribed to it varies by culture, subculture, and situation. For Japanese Americans, a smile with a bow is etiquette and does not indicate an emotion. The U.S. gestural repertoire includes smiles of pain, irony, joy, shame, modesty, humor, cynicism, imbecility, flirtation, cruelty, triumph, and even disassociation. Young Hawaiian and Native American women and older Japanese American women self-consciously cover their smile with their fingertips.

Gestural greetings are made by everyone, but their expressions are culture specific. For example, mainstream Americans associate direct eye contact and a firm handshake with strength of character. Native Americans, however, associate direct eye contact and a firm handshake with arrogance and disrespect. They greet each other with eyes slightly averted and gently clasp hands or touch fingertips. African Americans and others who wish to be “cool” alternately grasp one another’s thumbs. Members of fraternities signify their membership with esoteric handshakes. In polite Euro-American society, a lady proffers her hand before a gentleman extends his. Likewise, an older person initiates a handshake with someone who is younger. Respect is shown by allowing the lady or the older person to determine whether or not they will touch the other party.

Salutatory embraces and kisses in the United States are also determined by gender, age, status, and cultural backgrounds. Many American women greet each other with an embrace and a kiss on the cheek. But male-to-male, or male-to-female greetings with embraces and kisses are selective, lest those gestures violate propriety. American men

seldom greet one another with a kiss. Often they do not even kiss their own sons after they outgrow babyhood. However, men who follow Latin traditions kiss each other repeatedly on first one cheek then the other. Hawaiians of both sexes greet each other by an embrace and gentle nose-to-nose touches, on first one side then the other. Older Japanese Americans traditionally greet each other with a bow instead of physical contact.

Embodied ideas and feelings often include a complex of gestures. A person who reads a script over the radio uses gestures even though he or she is not seen by the radio audience. The person who wears a mask replicates the mask's expression gesture on his or her own face. Those invisible facial gestures accompany the visible bodily gestures. Interactive gestures often produce empathy, as exemplified by the mother who opens her own mouth while spoon-feeding her infant.

Some gestures need an exterior context in order to be deciphered. For example, a forward outstretched arm with the palm of the hand facing down can be, variously, a blessing, a request to be recognized, or a Nazi salute. In contrast, enchaind gestures often create their own context. The American Sign Language for the deaf and Plains Indian sign language are enchaind systems. Although those gestural languages are codified, the messages are not fixed. Similar to conversational oral speech, the content is extemporaneous, unique, and requires semantic interpretation.

However, signed messages may be stereotypical and re-dundant, especially at formal events. With a choreographed and fixed routine, based on Plains Indian sign language, pantomiming the song "Go My Son" is a popular performance piece for young Native American women. Enclaves of Tibetan lamas in exile are located in several areas of the United States. They all perform the same prayers and psalms, which interface chanting with esoteric *mudras* (gestures).

Mudras are used, also, in Bharatanatyam, a Hindu dance form that is attracting many students throughout the United States. The *mudras* have ascribed denotations, but, depending on the dynamics of performance, the connotations vary. A series of paragestures—that is, the "same" gestures modified to alter affect—can present such diverse emotions as longing, anticipation, impatience, jealousy, and pleasure, all differing facets of a base metaphor.

Hawaiian hula gestures interpretively illustrate the semantics of texts that characteristically have more than one meaning—literal, double entendre, and *kaona* (soul). Because specific glosses are not assigned to them as they are to *mudras*, hula gestures cannot be read as a sign language. However, combined with the texts, hula gestures teach, celebrate, and confirm the Hawaiian cultural legacy while they arouse emotions in both the performers and the audience.

When gestures are speech surrogates, they transmit information and interpretation without buttressing words. For example, the Yaqui Indian ritual performers called *chapayeka* do not speak while they are wearing their masks. Simple pantomime communicates basic ideas and provides comic relief. But when a *chapayeka* passes by a sacred icon, such as a crucifix, he twists and shakes his hips rapidly two or three times. That gesture causes clusters of deer or pig hooves on his belt to swish audibly. When several *chapayeka* pass by a sacred icon, in single file and one after the other, the ripple of trembling sounds reminds the onlookers of the divine metaphor.

Gestures reveal the human condition. Storytellers and actors borrow conventionalized gestures to indicate gender, age, health, class, role, and character in their representations.

With an astute use of gestures, a storyteller can eliminate much oral exposition. Fingers slightly separated on hands that move gracefully, a clenched fist that pounds the table, rigid fingers that claw at the air, and trembling flaccid hands—all evoke differing images.

Within the American gesture repertoire, there are many variables, such as gender, age, health, ethnicity, values, mores, economics, status, role, education, vocations, worldview, attitude, circumstances, and geographical region. The gestural repertoire, as dynamic as the United States itself, experiences timely changes with new cultural infusions, technologies, professions, and models for living.

Despite its multivariates, there is a standard American gesture repertoire (comparable to Standard American English but not formally acknowledged) that has been tacitly incorporated through common usages. Consistently displayed and reinforced in the television medium, it has become normative. Its primary antecedents are European, but additions and modifications make it uniquely American.

Gesture studies in the United States have focused on theory and methods, specific subcultures, and anecdotal accounts. There is no formal mapping of U.S. gestures and gestural dialects as Desmond Morris and colleagues provided for western and southern Europe and the Mediterranean (Morris, Colbert, Marsh, and O'Shaughnessy 1979).

Ubiquitous and important as both causes and effects in human communications, gestures are critical to the study of folklore and folklife.

Ghost Stories

Tales, legends, and personal-experience stories about revenants, informally called ghosts, creatures that return from the realm of the dead to help or harass the living. Popular among both children and adults, ghost stories have circulated widely in print and in the mass media, as well as in oral tradition. Some narratives are linked to specific places—often the scene of the person’s death—while others are more generalized.

In some early ghost stories told by Native Americans, the revenant is a skeleton (motif E422.1.11.4) that can heal injuries, frighten travelers, and shift its shape. Most ghost stories of more recent vintage feature ghosts that closely resemble living people. Their purposes in returning to Earth include completing unfinished business, getting revenge, revealing how they died, and disclosing the site of hidden treasure (motif E545.12).

Young children’s ghost stories tell of sudden noises that signal the revenant’s appearance. Aarne-Thompson (AT) tale types 326, “The Youth Who Wanted to Learn What Fear Is,” and 366, “The Man from the Gallows,” provide the frameworks for many children’s narratives. The hero of stories based on AT 326 must vanquish a ghost that announces its presence with such frightening cries as “One black eye!” and “Bloody fingers!” In variants of AT 366 that include “The Stolen Liver” and “The Golden Arm,” a dismembered corpse seeks revenge. Mark Twain explains the art of timing the catch ending of “The Golden Arm” in his essay “How To Tell a Story.” This folktale has frightened generations of campers and slumberparty participants. Published collections of ghost stories by Maria Leach, Alvin Schwartz, and others have reinforced children’s awareness of oral traditional patterns.

One of the ghosts best known to American children and adults is the vanishing hitchhiker (motif E332.3.3.1). In circulation since the 1890s, this legend has many subtypes, in all of which a spectral hitchhiker disappears. Proof of the ghost’s identity often comes from an object left behind: a blanket or a sweater, for example, that may be discovered draped over a tombstone. Sometimes the hitchhiker is a young girl who died a year or more ago; other times it is Jesus Christ, returning to tell people about the approach of the final judgment. The earliest vanishing-hitchhiker stories, collected in New York, tell of the ghost of a girl jumping up behind a young man on a horse. In Hawaii one incarnation of the vanishing hitchhiker is the volcano goddess Pele. Linkages also exist between the hitchhiker and *La Llorona*, the weeping female ghost of Mexican folklore. The vanishing-hitchhiker legend has inspired scenes in several movies, including *Pee Wee’s Big Adventure* (1985) and *Mr. Wrong* (1984). The legend has also developed a connection to conjuring games. Mary Whales, an accident victim said to be a hitchhiker at the site where she died, becomes the object of a game involving a mirror. Ritually repeating “Mary Whales, I believe in you,” the player tries to summon Mary, who may reach out to scratch her summoner.

Places with a reputation for being haunted draw visitors who may tell ghost stories before, during, and after their pilgrimages. Cemeteries and haunted houses are among the most frequent destinations, especially for adolescent visitors. Legends about deranged

individuals who killed themselves and others—and might still be awaiting further victims—provide raw material for dramatic enactments by groups. Buildings such as the House of Blue Lights in Indianapolis become famous locally; it is somewhat rare for haunted houses to achieve national recognition. The great popularity of the movie *The Amityville Horror* (1979), bolstered by newspaper accounts and oral legends about a house in Amityville, New York, provides one compelling example of the fascination exerted by haunted houses.

Ghost stories also arise in connection with high-risk occupations. In the South and West, stories of miners' ghosts are common; these ghosts may frighten people but frequently come back to help other miners. Big John and Jeremy Walker of West Virginia are two miners celebrated in local legendary. Similarly, flight attendants, firefighters, and others who have died in the course of their work may become the central characters of stories, often warning others to avoid potentially fatal situations.

While some ghost stories focus on helpful acts and others on malevolent behavior, certain narratives present revenants that simply want to do some of the same things they did while living. Residents of an old Yicrorian house in New York speak of hearing the ghost of the house's former owner carrying wood upstairs, as he did every evening when he was alive. Similarly, summer residents of an old house in Maine describe hearing seven footsteps in the parlor at midnight, speculating that a ghost has unfinished business there. Personal-experience narratives like these may become legends as friends of the tellers repeat them; alternatively, they may have more limited circulation within family folklore.

Dreams and visions of ghosts often provide the basis for ghost stories. Sometimes people find omens in visions and dreams; other times they find comforting indications that the spirit of a loved one is near. Stories about dreaming of a relative close to the time of that person's death, for example, may become very significant to the dreamers and those who hear their narratives.

More research needs to be done on the interrelationships among personal-experience stories, legends, and folktales about ghosts. The popularity of movies such as *Poltergeist* (1982) and *Ghostbusters* (1983) shows that ghostlore continues to flourish in the mass media. As more extensive studies of oral, printed, and mass-media ghost stories emerge, we will have a better understanding of this art form's evolution in our complex society.

Gordon, Robert Winslow (1888–1961)

Folksong collector. A native of Maine, Gordon became interested in ballads during courses at Harvard University. After graduation in 1910, Gordon briefly taught at the University of California at Berkeley, where he directed graduate students' theses on folksongs. Disliking institutional expectations, Gordon attempted to balance his popular and scholarly interests and returned to Harvard for advanced studies.

Harvard's Sheldon Fellowship provided Gordon funds to collect Southern folksongs during the early 1920s. Gordon built his own portable recording equipment for his Appalachian fieldwork and was one of the first folklorists to use this equipment in the Southern mountains and to interview a hill-billy singer. Basing his fieldwork from Asheville, North Carolina, Gordon recorded more than 1,000 cylinders of songs and photographed unusual folk architecture. In 1926 Gordon moved to his wife's hometown, Darien, Georgia, and initiated fieldwork to preserve African American folk traditions, especially ex-slaves' accounts, spirituals, and chants, along coastal Georgia and South Carolina.

Gordon chose to use pulp magazines, not scholarly publications, to discuss his work. As column editor of "Old Songs Men Have Sung" in *Adventure* magazine from 1923 to 1927, he acquired several thousand songs. Unlike other scholars who sought obscure folksong origins, Gordon focused on determining the precise historical events that inspired each song.

Gordon consulted for the RCA Victor Talking Machine Company in copyright lawsuits, most notably regarding "The Wreck of the Old 97." He testified in court about dating textual evidence by studying ballad versions. He also wrote a series of articles about folksongs in the Sunday *New York Times Magazine* from January 2, 1927, to January 22, 1928. In 1938 the Works Progress Administration's federal theater project published a compilation of these articles.

In 1928 Gordon was named the first archivist of the Archive of American Folk Song at the Library of Congress. His private collection formed the nucleus of the archive, and he acquired and indexed collections overlooked by scholars. In 1933, however, the library dismissed Gordon for erratic work habits.

Gordon performed clerical and editorial duties for several government agencies, collecting folksongs in his spare time. He participated in the American Folklore Society and at folksong festivals but never published a scholarly book or an article in folklore journals, and he remained on the periphery of his profession. His most lasting professional contribution was his extensive collection gathered through rigorous fieldwork.

Gospel Music

A 19th-century development in Protestant hymnody growing out of the evangelical movement's emphasis on emotion, conversion, and the believer's personal relation to Jesus. Gospel hymns usually exhibit a verse-chorus structure (eight measures to each), set to two contrasting melodies. The lyrics, almost always written in the first person, emphasize the loving relationship between the Christian and Jesus and dwell on the felt joys of salvation. The first verse and chorus of "Will the Circle Be Unbroken" offers a familiar example:

There are loved ones now in glory
Whose dear faces we often miss.
When you close your earthly story,
Will you join them in their bliss?

Chorus: Will the circle be unbroken
By and by, Lord, by and by.
There's a better home awaiting
In the sky, Lord, in the sky.

Anglo American gospel hymnody includes a Midwestern and a Northern urban tradition that drew on Victorian sentimental popular song and "correct" singing styles. Fanny Crosby was the most prolific early composer in this tradition, which was popularized by Ira Sankey and continued to be associated with the mass meetings and revivalism practiced by such evangelists as Dwight L. Moody, Billy Sunday, and Billy Graham. In the South, a regional tradition arose that drew on shape-note hymnody and on African American camp-meeting songs. In the early 20th century, gospel publishing houses such as James D. Vaughan and later Stamps-Baxter turned out hundreds of these songs annually. Many became part of the hymnals used in evangelical Baptist and Pentecostal denominations throughout the South, and the repertoire may still be heard there in bluegrass as well as popular gospel groups.

African American composers began writing music for gospel songs around the turn of the 20th century, and they have been sung by soloists, quartets and other small groups, and massed choirs. Among the most important composers were Thomas A. Dorsey (considered "The Father of Black Gospel Music") and W. Herbert Brewster (the greatest poet). Dorsey's best-known song is "Precious Lord," while Brewster's most famous are "Move up a Little Higher" and "Our God Is Able." In the Black communities, gospel is both a performing style and a repertoire of music. The style embodies ecstasy, improvisation, repetition, elaboration, dress, gesture, posture, and other features

characteristic of African diaspora culture and music, and the same improvisatory scale and mode used in spirituals, blues, and jazz. Black gospel music is sung in worship services, at special gospel concerts, in religious pageants, and recently in the theater. It has had considerable influence on secular Black genres such as blues, soul music, hard bop, funk, and hip hop.

Gossip

Conversational genre of moralistic and speculative talk about persons usually not present, the persons who engage in this talk, and the speech events of such interaction. Max Gluckman influenced its anthropological study by proposing rule-governed gossip and scandalizing as both hallmark and duty of small-group membership, functioning to bound struggles, maintain unity, and distinguish that group from others (Gluckman 1963). He acknowledges it as an art, but only more recent work has elaborated the performance and narrative skills required in this catalytic social process.

Because gossip deals informally and privately in particulars, personalities, and personal relationships, it is often considered a form of resistance to dominant, official, public culture—the province of those unable to address issues openly. Women are popularly believed to be gossips, a definition first noted in 1566: “A person, mostly a woman, of light and trifling character, esp. one who delights in idle talk; a newsmonger, a tattler” (Oxford English Dictionary [*OED*]). However, in Old English *godsibb* meant “god-related,” ritually established relationships between godparents, while Middle English usage designated familiar acquaintances of either sex, especially a woman’s female friends invited to attend her at childbirth. Samuel Johnson gives as his third dictionary definition of gossip: “One who runs about tattling like women at a lying-in.” By Victorian times, emerging male medical specialists forbade female gossips during labor because they were too “noisy.” Certainly men, too, are gossips, and the gender, age, and social status of both gossipers and their subjects must be determined ethnographically.

Gossip as both negatively and positively valued conversation was recognized by 1811: “Idle talk; trifling or groundless rumour; tittle-tattle. Also, in a more favourable sense: Easy, unrestrained talk or writing, esp. about persons or social incidents” (*OED*). Scholars have viewed it as an informal means of teaching morality, maintaining social control and solidarity, managing reputations, negotiating covertly, exchanging information, expressing sociability itself, and entertainment. Gossip’s powerful, ambivalent potential may be seen, for example, in its association with both witchcraft and traditional healing, the latter to aid diagnosis and treatment of social factors in illness. Jorg R. Bergmann claims its “equivocal-contradictory character” (publicly deplored, privately practiced) stems from being “a structural part of private information” that “violates the precept of discretion and respects it at the same time...insofar as a mutual friend is initiated into the secret and thereby a new secret created” (Bergmann 1993:149, 150, 152).

Until more ethnographic studies are undertaken, neither the universality of gossip nor its variety can be assessed. Ethnographies of speaking gossip are problematic in both fieldwork and presentation because the art of gossip—its performance and ethnoaesthetics—is by nature private, elusive, and situationally specific. Still, like more publicly valued narrative forms such as myth, epic, and legend, gossip should be considered significant storytelling that informs and enlivens social life in a range of groups.

Graffiti

Writings and inscriptions found on public walls and other surfaces. The term is derived from the Italian verb *graffiare* (to scratch) and the noun *graffio* (a scratching). The word “graffiti” is commonly used in English as a singular noun. Central to the contemporary application of the term is the implication that graffiti writing is an illicit activity; it exists in contrast to “official” inscriptions or informational graphics. Essentially, graffiti is a form of visual communication via the built and natural environments. As a subject of academic inquiry, graffiti is generally perceived as reflecting not simply the idiosyncratic concerns and values of individual writers, but also the broader concerns of particular social groups and society at large.

Among the diverse phenomena characterized as graffiti are prehistoric petroglyphs, inscriptions in the Roman catacombs, anonymous messages on the walls of public lavatories, love vows carved into the bark of trees, spray-painted territorial markings of contemporary gangs, and colorful letters and figures painted on the sides of New York City subway trains. Scholars from different disciplines have addressed the content of messages, the social groups who write the messages, and the aesthetic aspects of the practice. Some researchers have photographed and collected colorful examples into “art” volumes, while others have analyzed the texts as exhibitions of emotional

repression and wish fulfillment, interpreted the phenomena as indicators of social decay and the perpetrators as deviant, described its generation as a highly thoughtful means of communication, or used ancient inscriptions as historical evidence.

The first American scholarly treatment of graffiti was Allen Walker Read's *Lexical Evidence from Folk Epigraphy in Western North America* (1935). Read, a linguist, collected graffiti from the walls of public lavatories in the Western United States and Canada and used these examples to illustrate the difference between dictionary and vernacular usages of certain words. Thirty-one years later, folklorist Alan Dundes similarly collected graffiti but pursued psychological questions about why so much graffiti appeared in men's rooms. Coining the term "latrinalia," Dundes attributes the phenomena to the infantile smearing impulse and repressed male anal creativity (Dundes 1966). Other scholars have collected phrases from walls to generally reveal the prevalence of folk humor and folk speech in the form of traditional sayings, puns, and word games.

In many instances, graffiti can be a public forum, for it is, as one scholar insightfully characterized it, “gregarious” (Smith 1986:104). Graffiti can attract or prompt additional graffiti—often in direct response to what is already written on a surface. Chains of remarks and one-upsmanship will proliferate—advice may be requested and suggested, political views debated, or performances of verbal art displayed.

Particularly ubiquitous is graffiti that marks a person’s presence—“I was here”—or actions at a certain site. One such famous inscription is the carved beech tree in Tennessee that indicates “D.Boon Cilled A.Bar inThE YEAR 1760.” During World War II, a graffiti line drawing of a figure peering over a wall proliferated, accompanied by the claim “Kilroy was here.” This inscription is reported to have been found in the most inaccessible and far-flung places: under the *Arc de Triomphe*, on the torch of the Statue of Liberty, at the base of the Marco Polo bridge, and so forth. It is rumored that Kilroy was the brainchild of an infantry sergeant who sought to daunt the Air Force troops who often bragged of their prowess. Thus, every time Air Transport Command members set up base in a different country, they would be greeted by an inscription indicating that Kilroy had preceded them to that destination.

The signature—the name—is the central element in the graffiti most prevalent in urban public spaces in the 1990s. “Tags,” idiosyncratically penned nicknames, are etched with a sharp piece of metal, scribbled with a wide-tipped marker, or painted with a spray can on walls, trees, mailboxes, and windows. The objective of tagging is to demonstrate ingenuity and mobility, with the individual marking as many surfaces as possible. Taggers are not concerned with form and style so much as “getting up” or “getting around,” a project that resonates with the spirit of “Kilroy.” While “tagging” is practiced around the country, the first tagger of renown was TAKI 183, a teenager named Demetrius from 183rd Street in New York City.

The esoteric graffiti of social or cultural groups has also been documented. For example, “hobos,” the nomadic men who travel the country often via railroad boxcars, developed a means of written, symbolic communication that was chalked onto walls and fences to provide fellow travelers with messages that warned, for instance, of bad dogs or indicated the homes of “kind hearted ladies.” Mexican American youth in Southern California and the Southwest sometimes append the term “*con safos*” abbreviated as “cs” or “c/s” to their graffiti inscriptions to protect claims of identity, love, or territory.

The originators of “New York style,” the colorful combinations of words and images that first appeared on the New York subways in the 1970s, sought fame through style and technique rather than profusion. A number of arts organizations formed to promote graffiti as an art, several artists became recognized for their graffiti-style work, and for a while graffiti attracted the attention of the gallery art world. These developments introduced the discussion of whether to term these productions “graffiti” or “graffiti art.” Graffiti writers themselves distinguish between different categories of graffiti: “pieces,” short for masterpieces, indicate the more complicated designs; “throw-ups” refer to the lettering of initials or nicknames in a logotype configuration; and “tags” are the speedily applied name inscriptions. “Wild style” is the term used to describe lettering using stylized forms that seem unreadable. Over time, styles have been honed and tools and techniques developed for shaping letterforms and using color, and “style wars” have become a means by which preeminence is achieved. Graffiti writers sometimes form working groups, or “crews,” for self-protection and collaboration. Around all of the

writers, a social world has emerged with its own mores, visual and verbal languages, and criteria for judging artistic excellence.

Graffiti styles can be regional. Writers from different parts of a city or in different cities across the country develop distinct styles. On the West Coast and in the Southwest, Old English (Gothic) is a style of graffiti lettering often found in Mexican American neighborhoods. Since at least the 1940s, Chicano youth have painted their names or nicknames in Old English on public surfaces, reportedly as a means of instilling on their names the same honor and formality associated with the letterforms as used on diplomas and other official documents. Considered a classic, Old English continues to be a popular lettering form in Los Angeles and is sometimes referred to as “cholo style,” “West Coast style,” or “old style.”

Though in the late 20th century the term graffiti tends to provoke discussions about crime, vandalism, and distinctions between graffiti and graffiti art, it still refers to a broad range of human expressive inscriptions. Immigrants from Europe and Asia left poems and messages on the walls of the detaining centers of Ellis Island and Angel Island; “Croatan” was the enigmatic word hastily carved on a pole in 1590, the final trace of the mysterious “lost” colony of Roanoke, North Carolina. These examples may also be characterized as graffiti, and thus they underline the many potential angles for investigating this subject.

Gravemarkers

Monuments at gravesites to mark the spot of burial and commemorate the person departed. The erecting of gravemarkers is one of humanity's most ancient practices and has produced over the centuries artifacts of extraordinary beauty and cultural significance. In America the primary material for the fashioning of gravemarkers has always been stone, and the evolution of gravemaker style is inextricably keyed to three periods in which a particular type of stone dominated: slate (late 17th through 18th centuries), marble (19th century), and granite (20th century).

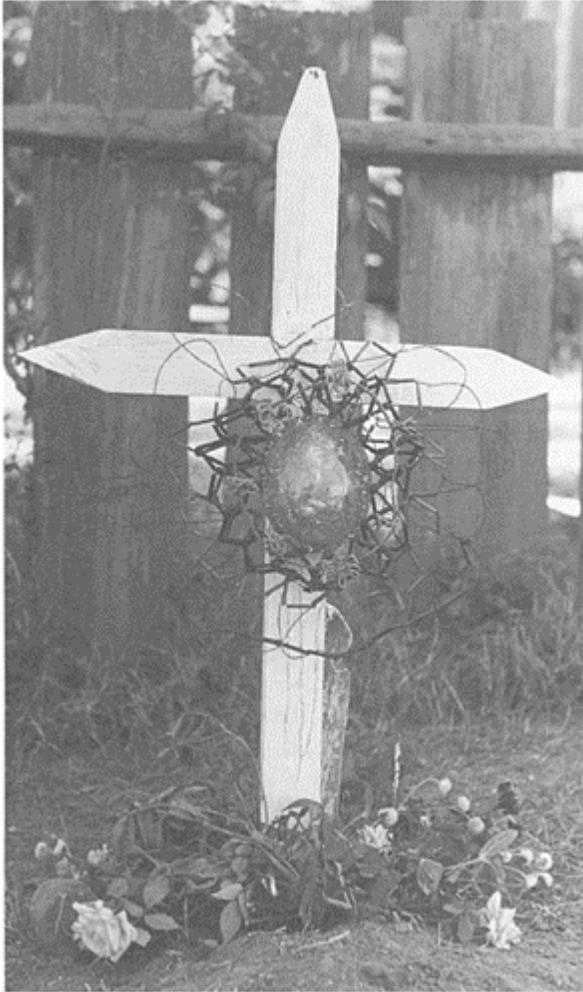

American art, it may be said, had its origins in the graveyard. Following several decades in which gravemarkers were fashioned of wood or roughly shaped fieldstone, the discovery of deposits of high-grade slate in the greater Boston area led to the adoption of this highly workable material as the memorial stone of preference among folk craftsmen in the communities of eastern Massachusetts. There, Puritan theological concepts became transformed into grim yet exceptionally beautiful folk artifacts that featured winged skulls, cross-bones, and even whole skeletons, as well as various secondary death symbols (coffins, hourglasses, picks and shovels) in the tympanum (top central) area of the erect, tablet-style markers. Intricate vegetative or geometric designs frequently decorated the side and bottom borders, while Latin inscriptions such as *Memento Mori* (Remember Death) or *Hora Fugit* (The Hours Fly) served as effective counterparts to the visually dominant mortality symbolism. Epitaphs similarly echoed these grim themes, the most popular featuring variations on this well-known quatrain:

Hearken stranger, as you pass by,
As you are now so once was I,
As I am now so you shall be,
Prepare for Death and follow me.

The passage of years would temper the grim severity of early American gravestone iconography, though slate remained the dominant medium (its only significant competition being the red sandstone favored in the Connecticut River Valley area of central New England). Carvers in the early 18th century gradually abandoned most overt mortality symbolism in favor of elements more suggestive of hope and eternal bliss. One of the most striking visual indicators of this shift is the manner in which the winged-skull motif, the most prevalent of gravestone symbols from the Puritan period, gradually metamorphosed into the winged cherub's head found on so many 18th-century markers. Gaining in popularity throughout this same period was another, far less emotionally charged visual emblem—the neoclassically inspired urn and willow motif. Verbal inscriptions reflected these trends also, with harsh reminders of imminent death giving way to prospective sentiments emphasizing eternal rewards or retrospective testimonials to earthly character and achievements.

Among the many changes that dominated American cultural life in the 19th century, there arose radically new concepts in cemetery design and function, and, concomitantly,

in the material artifacts that fill the cemetery landscape. Marble (with some competition from the visually similar limestone) would come to be viewed as the ideal stone for the monuments designed to occupy these sites, its greater adaptability to three-dimensional sculpture and larger scale, along

with the dazzling whiteness of its surface, making it far more appropriate than slate to the aspirations and cultural values of an aggressively expanding nation.

Though the modestly scaled, erect tablet would remain a staple of gravemarker design during this period, marble's versatility encouraged experimentation with ever larger and more elaborate forms, particularly when markers were created for wealthy patrons. The culmination of this trend may perhaps best be seen in the massive and richly decorated mausoleums, often inspired by "Revival-style" (Classical, Gothic, Near Eastern) architecture, which appear near the end of the century. The skills of gravestone carvers naturally expanded in accordance with these new fashions, though the ability to incise precise designs and lettering on the face of memorials would always remain the primary test of a given craftsman's talents. Near century's end, the popularity of marble was challenged briefly by a type of manufactured metal marker known as "white bronze" (actually a zinc alloy), which could be cast in a variety of forms and touted virtual indestructibility as its chief selling point.

Decorative symbolism on 19th-century gravestones is enormously rich and varied, the most commonly recurring motifs being the hand with upraised index finger (signifying resurrection), the weeping willow (a generic mourning emblem), and clasped hands (a contextually specific figure with several explanations). Also dating from this period are a number of images specifically associated with children, women, various occupations, and fraternal groups. Epitaph styles, especially late in the century, became increasingly unctuous and exhibit some of the least desirable qualities of bad Victorian poetry.

In the early 20th century, marble gave way to granite, a very dense stone prized initially for its durability and later as well for its range of color possibilities. Initial attempts to work decorative motifs upon the surface of this material were crude and aesthetically suspect, though with the application of new technologies, particularly stencil sandblasting and, more recently, laser etching, a seemingly endless number of artistic possibilities have become available to the designers of contemporary gravemarkers. At the same time, the increasing separation of these designers from the actual working of their medium raises interesting theoretical questions concerning the folkloristic nature of the craft and its products.

In keeping with late-20th-century American lifestyles and philosophies, both the visual and the verbal elements emerging with ever increasing frequency on markers since the 1960s have tended to place strong emphasis upon the individual and upon things of this life, particularly occupational and recreational interests. The dominant form of the 20th-century gravemarker has been that of the horizontal slab, placed flush with the ground surface, though recent decades have witnessed a noticeable resurgence of upright configurations.

There have, of course, always been gravemarkers fashioned of materials other than stone, a phenomenon perhaps most commonly associated with the practices of certain ethnic groups. Whether conceived as expressions of cultural preference or economic expediency, these artifacts of metal, wood, concrete, and a host of other substances are not only among the most beautiful and interesting of American gravemarkers but also retain most strongly the characteristics of a true folkart form.

Great Basin

Region of the American West where water flows to neither the Pacific nor the Atlantic Ocean but stays within the region, having no outlet to the sea. Other criteria to define the region include geology, flora, and its indigenous culture. The chief physical characteristics are that it is an extremely arid land of alternating mountain ranges and valleys called "basin and range." The Great Basin includes almost the entire state of Nevada, portions of California east of the Sierra, southeastern Oregon, southern Idaho and the western third of Utah (in some descriptions, also tiny corners of Arizona or Wyoming). Anthropologists use a cultural definition of the Great Basin, which also varies but generally includes the traditional lands of the Paiute, Shoshone, Bannock, Ute, and Washoe tribes, a region that covers an area larger than the physical Great Basin and extends into western Wyoming and Colorado and northern Arizona. This essay focuses on the physiographic-hydrologic Great Basin region as it is most commonly understood and accepted by the general public.

The Great Basin is a high and dry land, with an average annual rainfall of just 7 inches. The valleys, or basins, average 4,000 to 5,000 feet in elevation, with the peaks often more than 11,000 feet, and the two highest in Nevada just over 13,000. The land is rugged, poor in water, but rich in minerals, a fact crucial to understanding its history and culture.

The original human inhabitants of the Great Basin were mainly the Paiute, Shoshone and Washoe tribes. The Paiute to the west, and the Shoshone to the east, have very similar cultures, languages, and traditions. The Washoe, in far western Nevada and the Lake Tahoe region, belong to a different language group and have somewhat different traditions. All of these tribes lived in small family bands and were seasonally nomadic, a necessity brought on by the harsh, barren environment. Winters were spent in the valleys and summers in the foothills and mountains; survival depended on the ability to hunt and to gather plant foods.

Material arts were very limited, with a willow-basketry tradition the most distinctive aspect of the culture, one that continues. In the 1990s, the living basket makers are mostly elderly and are members of the last generation to be raised traditionally, speaking their native languages and familiar with traditional plants and foods. There is a heartening interest, though, in passing on those traditions, and more young people seem to be asking their elders to teach what they know.

The Great Basin tribes have a singing tradition that was originally unaccompanied but that is now commonly performed with hand-drum accompaniment. The songs are sung for dances and during hand games to distract the opposing team. Traditional celebrations, once called "fandangos," include the annual Pine Nut Festival in September to bless the nuts before the harvest. Other contemporary community events include rodeos and intertribal powwows.

The earliest non-native people to venture into the forbidding Great Basin landscape were usually just passing through on their way somewhere else. After the explorers came

parties of gold seekers heading for California in 1849, most of them following the Humboldt River through northern Nevada, and only a few staying to establish supply posts. Several parties of Mormon settlers were sent out from Utah in the early 1850s, and the town of Genoa at the base of the Sierra near Lake Tahoe lays claim to being Nevada's oldest settlement, founded as Mormon Station in 1851. Although those early settlers were recalled by Brigham Young in 1857, Mormons today are a significant element of the Great Basin population and culture, especially in Utah and eastern Nevada.

Nevada had its own mineral rush a decade after California's when the Comstock Silver Lode was discovered and the town of Virginia City established. Many people rushed back over the Sierra from California in search of riches, and at its peak in the 1870s Virginia City had a cosmopolitan population of more than 30,000. Numerous other small towns rose and fell with the fortunes of their mines, but many of them today are no more than ghost towns populated by legends of greatness. Many of the miners came from Cornwall in England and brought such traditions as a belief in Tommyknockers, little mischievous creatures who lived in the mines and stole lunch food, but also warned miners of impending dangers. Underground mining is almost a lost art, but a specialized occupational language, and the skills involved in prospecting and working ore, live on in a few independent miners.

A modern mining bonanza in northern and central Nevada has once again sent the state into the upper reaches of its periodic boom-bust cycle. These huge open-pit operations involve skills more akin to construction work than traditional underground mining, but some of the language survives, as well as the historical connection the workers feel for the industry that established the state.

Farming and cattle ranching followed shortly on the heels of the discovery of gold and silver, since all of those miners needed to be fed. The valleys of western Nevada were relatively well watered, although even the Native Americans had constructed irrigation ditches to help encourage some wild plant foods; settlers from Germany, Italy, and later Portugal began raising produce, hay for horses, and dairy and beef cattle to supply the booming mining camps. The northern and eastern parts of Nevada, and up into Oregon and Idaho, were much drier, but large cattle operations, often with corporate owners from Texas or California, soon began moving their herds in and establishing huge ranches—in the arid climate, it takes about 108 acres to support one cow and her calf. The ranchers also started cultivating and irrigating the natural hay fields along rivers and creeks, since winter feeding was a necessity. Basque herders were brought in to tend sheep, and they led an isolated and nomadic life following their herds.

A distinctive cow-working culture developed in the Great Basin, derived from the Spanish *vaquero* traditions that had evolved in California and suited to the dry, open country and the vast territories to be covered on horseback. Cowboys, called “buckaroos” (the name also derived from *vaquero*), are known for their skill on horseback and for their extravagant style of dress and horse gear. They wear large hats, bright scarves (called “wild rags”), and knee-length chaps (called “chinks”); they use silver-mounted bits and spurs, braided rawhide reins, and twisted horsehair ropes (called “mecarties”). All of these accoutrements have practical origins, but they have been taken beyond practicality in the buckaroo tradition. The recently rediscovered tradition of cowboy poetry seems always to have been a part of Great Basin cow culture as well, along with the better-known singing traditions, with origins in Victorian literary culture and a literate

cowboy work force. With thousands of acres of open-range cow country still existing, the Great Basin remains the home of a vibrant cowboy and ranching culture, despite the pressures of modern life.

In tandem with the development of mining and ranching cultures in the Great Basin came the railroads, first the transcontinental, whose Central Pacific line from San Francisco ran along the Humboldt River route through northern Nevada in 1868. From this main line ran numerous spurs reaching many of the mining cities such as Eureka, Ely, Austin, and Virginia City and serving as shipping points for cattle to markets east or west. Most of the towns in northern Nevada along the modern Interstate 80 got their start as railroad towns, including Elko, Winnemucca, and Reno, continuing a long tradition of the Great Basin being a place people passed through on their way to somewhere else.

Las Vegas, at the edge of the Great Basin, was also first established as a railroad town at the late date of 1905, when the line from Los Angeles to Salt Lake City came through. It did serve as a supply hub for some outlying mining camps in southern Nevada and northern Arizona, but, consistent with Nevada's pattern, it was primarily the main street of saloons, gambling halls, and hotels that made it an amusing stopping place en route elsewhere. Nevada's hot, dry, rugged nature did not have much to offer travelers until gambling was legalized again after a ten-year hiatus in 1931, when Reno started its rise as a tourist destination; Las Vegas' growth spurt started after World War II and the evolution of the Southern California automobile culture.

At the closing of the 20th century, gambling and tourism are Nevada's biggest industry, while other areas of the Great Basin without the lure of "gaming" (the industry's preferred term for gambling) still rely on ranching and mining—and this includes the majority of Nevada. The whole culture of gambling is rich with tradition—good- and bad-luck beliefs, specialized language, and legends of mob involvement, to name a few. A thriving entertainment industry accompanies the gambling culture, and showgirls, magicians, lounge acts, and even prostitutes (working legally and illegally) have rich subcultures that add to the Great Basin stew.

Another major presence in the Great Basin from its earliest times has been the federal government, which owns, as an example, 87 percent of the land in Nevada. Irrigation projects, Bureau of Land Management (BLM) grazing lands, National Forests, military practice areas and bombing ranges, a Department of Energy lab in Idaho, and the Nevada Test Site for nuclear weapons are all examples of the strong, and often resented, federal occupancy of the arid West. As much as Westerners take pride in their independence, their way of life would not be possible without the role of the federal government—if only for the fodder it provides for stories about inept BLM rangers, secret UFO research facilities, mutant creatures in the tunnels at the Test Site, and window-shattering overflights by military jets.

One major role played by the federal government in the Great Basin is in the capture and distribution of the region's scarce water. Irrigation projects in the 1920s made possible much of western Nevada's farming economy, and Hoover Dam (Boulder Dam to the locals) was a major boost to southern Nevada's economy during the Depression, and makes possible the tremendous growth of Las Vegas and Los Angeles. Water has always been a revered commodity in the desert, and the frequent appearance of the Paiute-Shoshone syllable "pah," meaning water, in place names and tribal names reflects this. Many stories of the Paiute and Shoshone people concern water sprites. Stories of hidden

underground lakes, a tunnel connecting Lake Tahoe and the water in the Virginia City mines, thefts of water from irrigation ditches, mysterious disappearing underground rivers, and devastating flash floods testify to the power of water in the nation's driest region.

Like the rest of America, the desert West has always been seen as a land of opportunity, and immigrants from around the world have been a part of its culture for more than 100 years. These include Irish and Chinese railroad laborers, miners from England and Ireland, storekeepers and farmers from Italy and Germany, and Basque shepherders. In fact, in the late 19th century Nevada had the highest foreign-born population of any state in the union. Early on, most of these immigrants were European, and they assimilated quickly into the culture of the surrounding community and occupational groups, but the Chinese, Mexicans, and Native Americans were not so accepted. In the late 20th century, the Hispanic population—which is diverse, coming from Central and South America and the Caribbean as well as Mexico—is growing rapidly throughout the region, in ranching communities as well as big cities. Other non-European immigrants are primarily moving to the cities—Las Vegas in particular—in search of work in the booming economy. The cities of the West are the ultimate in community-defying suburban sprawl and alienating economic conditions, exacerbated in Nevada by the twenty-four-hour lifestyle and the shift work required to make it possible, so the conditions necessary to maintain traditions and a sense of history and community are sorely lacking. Still, the folk arts and cultures of these new residents, whether from Thailand, Paraguay, Ethiopia, the Philippines, or Lebanon, are present, although people are struggling to keep folk traditions a part of their daily lives.

The Great Basin is both the most rural and the most urban area of the country. Well over 80 percent of Nevada's population lives in Reno or Las Vegas, and Las Vegas is one of the fastest-growing cities in the country in the 1990s. The vast majority of the land in the Great Basin, however, is thinly settled. Although people speak of "rural" Nevada, many of the small towns there are not rural in the traditional sense of being agricultural, but rather are historically urban and industrial cities because of the mining influence. They may be small and isolated today, but they retain more of an urban sensibility than a rural one. The Great Basin's ranching communities are communities in the cultural rather than the geographic sense. Ranchers living hundreds of miles apart know each other and keep up with each other's doings more regularly than neighbors on the same street in Las Vegas ever do.

The folk culture of the Great Basin has been strongly shaped by the region's harsh climate and geography, probably more so than in other areas because it is so limiting and unforgiving. The strongest human-made influence in the region is legal gambling in Nevada; were it not for the chance to win money with no effort, there would be little reason for outsiders ever to stop on their way through. Those who live in the Basin have had to adapt to its reality and have developed unique traditions that make the most of what it has to give.

Great Lakes

Lakes Huron, Ontario, Michigan, Erie, and Superior (remembered by the acronym HOMES), bordering the states of New York, Pennsylvania, Ohio, Michigan, Indiana, Illinois, Wisconsin, and Minnesota on the U.S. side and the province of Ontario on the Canadian side. Folklore of the Great Lakes is widely varied in content and form and includes folk beliefs, legends, tall tales, customs, festivals, rhymes, proverbs, foodways, folk architecture, and more—the full range of expressive culture found in any area of the country. Each state or province has its own unique lore about the lakes, but there is also folklore that extends from one end of the Great Lakes to the other.

For instance, old-timers on all of the lakes talk about the effects of pollution and how at an earlier time the lakes were much clearer than they are today. Commercial fishermen tell stories about being able to see huge schools of fish at great depths, and they complain about the extinction of certain species that used to be abundant. Massive efforts have been made since the 1970s to clean up the lakes, and they have been largely successful, but the folklore continues to project a Golden Age of purer water and more abundant fish populations.

Occupations connected to the inland seas have folklore that can be found on all five Great Lakes. Workers on the large freighters that carry iron ore, grain, coal, petroleum, and steel on the lakes have a body of occupational folklore that binds them together. Great Lakes sailors have a number of superstitions—for example, it is bad luck to have a woman on board a ship, and it is bad luck to whistle on the ship—beliefs that they share with seafarers worldwide. The freighters sail the Great Lakes from April until December, when ice and winter storms make navigation difficult if not impossible. Workers on freighters face the hazards of storms, ice, fog, and other potential disasters. The most famous freighter accident on the Great Lakes was the sinking of the *Edmund Fitzgerald* on Lake Superior. Singer-songwriter Gordon Lightfoot's popular ballad "The Wreck of the Edmund Fitzgerald" is in the tradition of earlier Great Lakes ballads such as "The Persian's Crew," "Red Iron Ore," and "The Beaver Island Boys."

Other occupational groups on the Great Lakes have their own folklore. For instance, commercial fishermen have traditional knowledge and techniques about making and mending fishing nets. They tell personal-experience narratives that help define them as individuals who have strong identities as fishermen. On Lake Erie, commercial fishermen tell of the hardships of fishing—long hours, hard work, and low pay—that often cause them at some point in their lives to quit fishing and go to work in factories on shore. Invariably, they get tired of being indoors and punching a time clock and return to the lake. "Fishing gets in your blood," they say as a means of explanation.

Many outdoor occupations along the Great Lakes have similar attitudes toward their work. Loggers in the forests of northern Michigan, Wisconsin, Minnesota, and Ontario also see themselves as freedom-loving, independent outdoorsmen who have an almost mystical attachment to their jobs. According to Edith Fowke, Ontario loggers tell stories about the giant lumberjack hero Paul Bunyan, but Richard M. Dorson claimed that Paul

Bunyan stories are mainly used for advertisements and local promotions that have caused Paul Bunyan to become strongly associated with the woods around the northern side of the Great Lakes. There are Paul Bunyan festivals, woodchopping and logrolling contests, wood carvings, and outdoor dramas throughout the region, and many of these events are directly tied to tourism.

Tourism and folklore have a strong connection in the Great Lakes, especially in resort areas. The use of local or regional folklore to promote tourism can itself revive dormant folk traditions or, as seems to be the case with Paul Bunyan, create an image of a folk hero in the popular imagination. In Vermilion, Ohio, on Lake Erie, a boutique has kept alive the memory of an old local-character fisherman named Jib Snyder with a statue of him outside the shop. The commercial fishermen tell stories about Jib Snyder that contradict the noble "old salt" image of the statue. According to them, he was an alcoholic who could not navigate his own boat, who was regularly thrown in jail, and who had to be taken to the hospital to be given his annual bath. Thus, the folklore of a small group may differ markedly from the popular tourist representations of the group. There are likely to be touristic uses of folklore wherever there are resort areas, including Mackinac Island on Lake Huron, Sleeping Bear Dunes on Lake Michigan, and Isle Royale on Lake Superior.

Most of the resort areas are located in less populated areas, but there is also folklore associated with cities on the Great Lakes—Toronto, Hamilton, Buffalo, Cleveland, Gary, Chicago, Milwaukee, and Duluth. These cities are populated by a cross section of the major ethnic groups in North America, and each group has its own body of folk traditions. From West Indian festivals in Toronto, Polish American foodways in Buffalo, Italian American folk beliefs in Cleveland, Hungarian American storytelling in Gary, African American blues music in Chicago, German American beer halls in Milwaukee, and Serbian American folk dance in Duluth, there is a rich tradition of ethnic folklore throughout the Great Lakes region. Cleveland's West Side Market, which is only a few blocks from Lake Erie, contains stands selling foods from many ethnic traditions, and the people selling and buying these goods represent every ethnic group in the city; the market is a virtual microcosm of ethnic America. The audience listening to blues musician Buddy Guy at the Checkerboard Lounge on the South Side of Chicago is mainly Black, but there are usually a handful of White people there, often German or French tourists.

American Indian folklore is found in both urban and rural areas on the Canadian and U.S. sides of the Great Lakes, and, in fact, the political boundary has often been ignored by Indian tribes with members on both sides of the border. According to Robert B. Klymasz, the Iroquois have an annual border-crossing parade and festival that is meant to transcend the idea of national borders and reinforce Indian identity (Klymasz 1983). The celebration includes the selling of Indian crafts and foods so that again there is an element of tourism, but a political function seems more important in this case. Their identity is more closely linked to the Great Lakes region than to either country.

There is both a folklore of the Great Lakes and folklore in the Great Lakes region; the first kind reflects the region itself and includes legends and ballads such as "The Wreck of the Edmund Fitzgerald" and stories about water purity in a Golden Age. The second kind includes most of the ethnic folklore, which would be the same or similar to ethnic folklore in other regions of the United States or Canada. Some folklore seems to be both in and of the Great Lakes; Paul Bunyan is strongly associated with the region, but there is

also Paul Bunyan lore in the Pacific Northwest, taken there by loggers who migrated from one region to another. The occupational folklore of commercial fishermen is linked to the particular lake where they fish because their personal narratives are set on that lake and mention specific place names; on the other hand, their occupational narratives have similar patterns to stories of fishermen in other parts of the United States and Canada. The folklore of the Great Lakes is as complex and varied as the size and diversity of the region suggest it would be.

Great Plains

The vast west-central section of North America, stretching from Texas into Canada, comprising one of the world's largest grasslands. Once termed "The Great American Desert" because of the paucity of trees, much of the native prairie sod of the Great Plains has been turned into farmland, resulting in a more positive nickname, "The Bread Basket of America." The region remains, as well, the major cattle-raising area of the continent. Both farming and ranching have contributed significantly to the folklore of the region.

As with many geographical regions, the precise boundaries of the Great Plains are imprecise. Using the broadest interpretation, which would include much of the original tall-grass prairie of the midcontinent, the eastern fringes of the Plains extend into parts of Missouri, Iowa, and Minnesota, while the western boundary is more clearly demarcated by the Rocky Mountains. Major river drainages include the Rio Grande in the south and the Missouri and its tributaries to the north. All or parts of thirteen states and three Canadian provinces lie within the region: Texas, New Mexico, Oklahoma,

An Indian on horseback graces the cover of a calendar. Halftone photomechanical print of a drawing by Frederic Remington, 1897. Library of Congress.

Colorado, Kansas, Missouri, Iowa, Nebraska, Wyoming, South Dakota, Minnesota, North Dakota, Montana, Alberta, Saskatchewan, and Manitoba.

Although the general appearance of the Plains is to the unskilled eye featureless, in truth the landscape is varied. Native plant life ranges from the sagebrush and mesquite of the Southwestern Plains, to the native tall-grass prairies of the Eastern Plains, to the shortgrass of the Canadian Plains, while major agricultural crops range from cotton in Texas, to corn, sorghum, and soybeans in the Central Plains, to winter wheat in the Southern and Central Plains, to spring wheat and flax in the Northern Plains. Geographically, the rolling vistas of the Plains are broken by numerous broken landforms—the Palo Duro Canyon of Texas, the Osage Hills of Oklahoma, the Flint Hills of Kansas, the Sandhills of Nebraska, the Black Hills of South Dakota, the Badlands of

North Dakota, the Bearpaw Mountains of Montana, the Bighorn Mountains of Wyoming, and the Cypress Hills of Saskatchewan, to name some of the more obvious.

In the pre-Columbian era, the expanses of the Great Plains were filled with game—bison, elk, antelope, deer, bear, wolves, panthers—and were home to native peoples whose lifestyles ranged from nomadic hunters to village agriculturists. The Spanish colonization of the Southwestern Plains, beginning in the 16th century, caused a great change in the folkways for those Plains Indians that acquired the horse. Such tribes as the Pawnee and Mandan continued to farm and live in earthen lodges for part of the year, then go on extended buffalo hunts, while other tribes such as the Cheyenne and Sioux gave up farming completely to become true horse nomads. A distinguishing feature of indigenous Plains cultures was the sundance, a religious ritual that was present in one form or another in every Plains tribe.

European cultural influences in the Great Plains began with the Spanish explorers in the south and with the French fur traders in the north. Much of the U.S. portion of the Great Plains was acquired in the Louisiana Purchase of 1803. Early explorers such as Lewis, Clark, Pike, and Long were not impressed with the economic potential of the region, which, along with its comparative aridity, caused it to be one of the last regions of the continent to be settled by Euro-Americans. Its late-20th-century reputation as “flyover” or “drive-across” country mirrors the attitudes of traders who crossed the Plains on the Santa Fe Trail, of settlers bound for the Pacific Northwest on the Oregon Trail, or of mountain men and fur traders who plied the Missouri in the first half of the 19th century, none of whom became permanent settlers.

The Kansas-Nebraska Bill of 1854, which opened the Central Plains to settlement with the provision of popular sovereignty on the issue of slavery, resulted in “Bleeding Kansas,” a pre-Civil War conflict that brought elements of both Southern and New England cultures into the territory. Settlement by farmers on the Central Plains after the Civil War was encouraged by the Homestead Act of 1867. At the same time, Texans on the Southern Plains were beginning to organize cattle drives to Kansas on a vast scale—several million head over a twenty-year period—an enterprise that would result in the creation of America’s greatest folk hero, the cowboy.

Among the cowboy’s many contributions to folklore are a distinctive work attire (wide-brimmed felt hat, high-heeled boots, neckerchief, chaps), equipment (spurs, saddle, lariat rope, chuck wagon), methodology (roping, bronc riding, roundups, trail drives), and sport (rodeo). A significant contribution to the body of American legend derives from the exploits of such cowtown lawmen as Wild Bill Hickok, Wyatt Earp, Bat Masterson, and Bill Tilghman, while, in the tradition of Robin Hood, Great Plains outlaws such as Billy the Kid, Cole Younger, Sam Bass, and Belle Starr have been romanticized and glorified. On a more mundane level, tales and stories relating to the dangers, attractions, and excitement of ranch work are traditional among working cowboys. Much of this narrative material has, for well over a century, been fashioned into verse and song. While public recitations of cowboy poetry have only recently come into fashion, cowboy songs have long been a staple of American folk music and balladry. Some, such as “The Old Chisholm Trail,” are trail-driving songs, sung by lone cowboys to relieve the tedium of daily work. Others, such as “When the Work’s All Done This Fall,” are campfire or bunkhouse songs, sung on occasions of leisure to entertain one’s fellow cowhands. Still

others, such as “I Ride an Old Paint,” are work songs, night-herding songs sung to keep a trail herd of longhorns at rest—and the cowboy awake.

The Great Plains farmer, too, has had a distinctive impact on American folklore, from the image of the covered wagon, to the sodbusting plow, to the statues of “The Madonna of the Plains” that can be found in towns throughout the region. Conflict between homesteaders and cattlemen over the use of the Plains sometimes resulted in legendary conflicts, such as the Johnson County War in Wyoming. Among the beliefs fostered by the attempts to settle the semiarid Plains was that rain would follow the plow, that planting trees would increase rainfall, and that clouds would form from the smoke of railroad steam engines, thus causing more rain to fall. Actually, annual rainfall tends to vary significantly over much of the Plains, which can result in a string of good years followed by a long-lasting period of drought. Widely variable weather, in fact, is a hallmark of Plains life and provides the basis for much Plains folklore, including rainmaking, forecasting, superstition, and humor. A body of tornado lore permeates the Southern Plains, while jokes about sudden and drastic temperature swings (such as the farmer skinning the ox that died of heat exhaustion only to have its yoke-mate freeze to death before he finished the task) can be heard throughout the region.

One of the most colorful symbols of pioneer farm life on the Plains was the sod house, an architectural necessity resulting from the lack of economically available wood or stone for building, particularly on the High Plains (generally speaking, that area west of the 100th meridian). Using a special plow, a farmer would turn over furrows of native sod, then cut them into building blocks to be laid up as walls for houses, sheds, and fences (thus the expression, “ugly as a mud fence”). Sod houses were well insulated, being warm in winter and cool in summer. If the roof, however, was made of sod, it would not only leak but would continue to drip long after rain had ceased falling. Moreover, insects, mice, and snakes often lived in the walls. Thus one of the first signs of affluence in a pioneering Plains family was the building of a frame house.

As with the cowboy, farming songs from the Great Plains form a major subgenre in American folk music. Some, such as “Sweet Betsy from Pike,” originated with travelers on the Oregon Trail, while others, such as “The Lane County Bachelor,” reflect the rigors of homesteading on the sod-house frontier. Boom and bust are reflected in a song with variants ranging from “Kansas Land” to “Saskatchewan Land,” in which life on the Plains is either praised for its rich agricultural rewards or damned for the drought and the heat that have reduced the unfortunate homesteader to poverty. A song considered by some to be the most beautiful of all American folk lyrics is “Home on the Range,” which originated on the farming frontier of north-central Kansas in 1873, then was spread throughout the West by cowboys, before becoming a standard popular song in the 1920s.

Other major occupational folk groups in the Great Plains include, or have included, miners (for gold in the Black Hills of South Dakota or for lead and zinc in the Little Balkans of southeast Kansas and northeast Oklahoma), railroaders and railroad builders, and oil-field workers. Some of the major oil fields in the country have been found in the Great Plains (Texas, Oklahoma, Kansas, North Dakota, Wyoming), resulting in all of the traditional raucousness and lore associated with boom towns.

Ethnic plurality in the Great Plains was greatly enhanced in the later 19th century by the practice of the railroads in promoting immigration from Europe. Among the many groups that have made permanent homes in the Southern and Central Plains, alongside

the earlier settlers of British heritage, are Mennonites (including Amish), Volga Germans, and Czechs, while the Northern American Plains were heavily settled by Scandinavians, as well as Hutterites, Germans, and central Europeans. The Canadian Plains, in addition to residents of British origin, have many pockets of central Europeans and Ukrainians, as well as the French and Indian *Métis*. A sizable population of American Indians still lives in the Plains, many on reservations. In the decades following the Civil War, many ex-slaves from the South moved into the Central Great Plains in a migration known as the Exoduster movement. Chinese laborers were often used in railroad construction on the Northern Plains, while Mexican laborers were imported for the same type of work in the Southern Plains. In the recent past, large populations of Southeast Asians have come into the Central and Southern plains to work at meatpacking plants. The influence of minorities, including African Americans and Jewish settlers, was relatively common in pioneer Plains life, despite popular belief to the contrary.

Folk arts in the Great Plains have been influenced by ethnicity as well as by geography. Many traditional crafts that arrived with settlers, such as *kraslice* (egg decorating), tatting, and quilting, have been continued. Other crafts that have developed in the region, such as saddle making and spur making, can be traced back to the cattle drives of the late 19th century. Influential pioneer saddlers such as Frazier, Gallatin, Meanea, and Collins, for instance, were located in the North-Central Plains in order to take advantage of cowboys when they were paid at the end of a trail drive. For the same reason, early boot makers, such as Charles Hyer of Olathe, Kansas, reputed to be the first to make a distinctive pair of cowboy boots, were often located in or near the shipping centers or market towns of Kansas.

In addition to the folksongs of the farmer and the cowboy that developed on the Great Plains, settlers often brought with them their own musical traditions. Thus, mariachi music and *corridos* can be found in the Southwestern Plains of Texas and New Mexico, while the dance music of the Germanic and Slavic settlers tended to run from Texas into Canada. In terms of effect on popular music, the Great Plains can be seen as the home of Western Swing in the south to Lawrence Welk in the north, not to mention the influence of cowboy songs on country-western music.

Distinctive forms of material culture in the Great Plains, in addition to sod houses, include barns of varying designs and sizes, hay sheds (some of them "hay barracks" with movable roofs), corncribs, cotton gins, silos, and grain elevators. The cattle guard, a gate substitute made by spacing metal bars over a pit in the roadway that is now found on every continent, was first developed as a device of Great Plains folk technology. Post rock, a layer of easily worked limestone found in north-central Kansas, is used extensively for fence posts and construction of bridges and houses.

Among the many folk monuments in the Great Plains are the Garden of Eden in Lucas, Kansas (a concrete sculpture garden reflecting the populist leanings of its creator, S.P. Dinsmoor); the fifteen-foot-tall jackalope statue in Douglas, Wyoming; the giant cowboy outside the Big Texan Steakhouse in Amarillo; the huge fiberglass pheasant in Huron, South Dakota; and Salem Sue, a giant Holstein cow statue in North Dakota.

Greek Americans

Immigrants from Greece and their American-born descendants. Greek sailors may have been aboard Christopher Columbus' ships when he discovered America; and Greeks were recruited along with Italians in the late 18th century to work in the vineyards and orchards of Florida's New Smyrna colony. But people from Greece did not immigrate to the United States in large numbers until the second decade of the 20th century. The nearly 200,000 who reached America's shores between 1911 and 1920 settled principally in large East Coast and Midwestern cities such as Boston, New York, Pittsburgh, and Chicago.

Poverty, political oppression, and natural disasters motivated Greeks to emigrate during the late 19th and early 20th centuries. Many came to the United States only to earn and save enough money to be able to return home and buy land. Like other "new immigrants" from southern and eastern Europe, however, most Greeks remained in America and made their living not from the soil, but by working in factories and operating small businesses instead.

Because of quotas, fewer than 1,000 Greeks a year entered the United States from the 1920s through the 1950s. But the numbers swelled again beginning in 1965. More than 120,000 Greeks were admitted to the country in the decade that followed. Unlike their unskilled predecessors, many of these immigrants were educated professionals who moved quickly and easily into positions as teachers, doctors, and engineers.

Greek immigrants come from a country with a long history and rich variety of folk traditions. The mythology that mirrored and reinforced the ancient Greek pagan belief system lives on in the customs and folk narratives of Christian Greeks. Features of the landscape, sociopolitical institutions, and historical events give rise to an ever-evolving body of legendry and song. Isolation and resourcefulness led to the development, and contribute to the perpetuation, of a rich and varied handicraft tradition that manifests itself most notably in woven goods, embroidery, and metalwork. Preparing traditional foods, making music, and dancing are integral parts of life-cycle and calendrical events in all of the areas of Greece from which people emigrate.

Greek immigrants have always done what is necessary to adapt to life in the United States. They learn English and speak it when required or appropriate. They acquire the education, skills, and know-how to make a living. They participate in leisure activities that preoccupy other Americans. But much folklore of the Greek homeland remains relevant in the United States, and it often takes on added importance in a multicultural society. Folklore serves Greek immigrants and their American-born descendants as a means of remembering, and making their children aware of, their history and cultural background. It also facilitates their interactions, both with fellow Greeks and with others interested in their homeland and culture.

Greek Americans express their heritage at such public events as ethnic festivals principally through foodways, music making, and dancing. Foods traditionally prepared and regularly expected in Greek American homes and at special events include egg-

lemon soup (*sóopah ahvghohlémohnoh*), stuffed grape leaves (*dohlmathákya*), roasted or skewered lamb (*ahrnée*), rice pilaf (*peeláfee*), cheese pie (*teeróhpeetah*), salad (*saláhtah*), bread (*psohmée*), resin-flavored wine (*retséénah*), and pastry made with filo dough, chopped nuts, and honey (*haklahváh*).

Greek American musicians performing folk music play a combination of string, wind, and percussion instruments—usually a violin, clarinet, lute, drum, and sometimes (but with ever-decreasing frequency) a *santouíri*, a trapezoid-shaped dulcimer played with two covered wooden mallets. The *bouzouki*, a long-necked, mandolin-like stringed instrument, has increasingly become an integral part of, and the lead instrument in, Greek American folk-music ensembles. Electric amplification is also common for performing groups in the 1990s, most of which play American popular, as well as Greek folk, music.

Both live and recorded music accompany traditional circle and line dancing in which Greek Americans participate. When musicians are present, they usually follow the lead dancer, complementing and accenting his or her movements instrumentally. The person leading the open-circle *syrtó* pulls the chain of dancers along, holding hands and moving counterclockwise with dragging and shuffling steps. The popular *kalamatiano* is another open-circle dance characterized by springing steps rather than foot dragging, with a lead dancer leaping and whirling about as the followers hop and skip behind him or her. The *hassapiko* is another fast-paced, carefree

dance, done in an open circle with hands on shoulders and movement counterclockwise. The *vari hassapiko*, by contrast, is a slow chain dance, done with hands on shoulders and movement to the right with the body bent slightly forward. Steps are catlike, and legs are

tense and moved sharply. Numerous variations of these and other folk dances not only persist, but also continue to evolve in the United States, and new variants feed back to the homeland and influence traditional dancing in Greece as well.

While traditional foodways, music making, and dancing are overt behaviors that invite public observation and even participation, much of the folklore of Greek Americans manifests itself only in small-group gatherings and private rituals. A fatalistic worldview that some scholars trace back to ancient Greece is common among Greek Americans, many of whom protect themselves from unwanted changes in their fates by prefacing future-oriented statements with “if God wills” and taking precautions against the evil eye (*mátiasma*). Spitting three times in the direction of a person or animal one admires averts ill effects of inadvertently looking admiringly at the object of praise, and wearing blue beads with small eye shapes painted on them protects oneself from the consequences of jealous or excessive admiration. Garlic is another effective evil-eye preventive, whether eaten in whole cloves, worn on one’s person, or included in traditional utterances that accompany one’s compliments (such as “*Skórdho sta mátia su*” [Garlic in your eyes]).

Stories about the consequences of being overlooked are told to illustrate and reinforce the belief in the evil eye. One concerns a narrator’s pretty baby sister upon whom an aunt inadvertently cast the evil eye “because she didn’t have any saliva in her mouth that day to spit the baby” The child died shortly thereafter. Another recounts an eyewitness’ report of a huge rock breaking into “six, seven pieces” and a pony dropping dead immediately after a woman capable of casting the evil eye had praised each (Georges 1980:80–83).

Because of the pervasiveness of the belief in the evil eye, numerous diagnostic and curing rituals that immigrants learned in Greece are practiced traditionally in the United States as well. One involves dropping olive oil into a plate containing water and looking to see if the oil forms eye shapes. Another requires one to flick cloves into an open flame, mentioning, each time a clove is flicked, the name of a person with whom the afflicted had come into contact immediately prior to his or her being stared at. When a clove pops, the person whose name is associated with it is pronounced the culprit. Treatments range from having the victim drink from the other side of a cup or glass from which the suspect has drunk, to anointing the overlooked with ashes from an herb such as chamomile or basil that crackles when it is burned.

Traditional beliefs and rituals based on, and suggested by, the Greek Orthodox religion are also numerous and varied. Like those in their ancestral homeland, many Americans of Greek descent venerate figures in the religious pantheon—particularly the Virgin Mary and various saints. Saints’ icons are displayed not only in churches, but also in homes and occupational environments (in cars and trucks, aboard merchant ships, on animals utilized in one’s work). Icons are used traditionally in diagnosing and curing maladies; and they are the foci of home altars, before which people not only regularly pray, but also make requests for saintly intervention and assistance. That such requests are frequently granted is attested by the miniature likenesses of human limbs, hearts, eyes, and such (*tágmata*) that one sees adorning or surrounding icons in Greek Orthodox churches and shrines (Teske 1980). Further attestation comes from the recounting of personal experiences about saintly interventions being responsible for miraculous cures, survivals from natural disasters, financial turnarounds, and career and economic successes.

In addition to telling stories about evil-eye incidents and saintly assistance, Greek Americans also recount personal experiences associated with immigration and the challenges of adapting to life in a new land. Many such tales are humorous, such as that about the non-English-speaking Greek who asks a friend to teach him a few English words so he can get something to eat in a restaurant. The words he learns are *apple pie and coffee*. “Every day for all meals I had *apple pie and coffee*, “the man reports. Anxious to try something else, the man asks his friend to teach him some more words and is told to order *a sandwich with eggs and ham*. When he first orders this, he’s asked how he wants the eggs cooked. Unable to respond, the man orders apple pie and coffee again instead.

Another story concerns a Greek who finds an Italian produce store he likes. His visual cue for locating the market is the pile of watermelons on the sidewalk by the entrance. The Greek shops at the store regularly. But one day he cannot find it because the season has changed, and there is no longer a pile of watermelons outside to enable him to locate it (Gizelis 1974:132–133,139). More sober narratives illustrate both the overt and covert discrimination that Greeks (like other immigrants) experience in the United States because of the sound of their native language, their appearance, or their ignorance of American customs and laws.

Also a part of the narrative repertoires of many Greek immigrants and some of their American-born descendants are entertaining fictional tales, most told less frequently today in the United States than in the past. The trickster figure Nastradin Hodja is the protagonist of one cycle of still enjoyed humorous tales, many of which Greeks share with other peoples from southeastern Europe, the Middle East, and North Africa. Frequently, Hodja is depicted as stupid or naive, as when he ignores the warning of a passerby and continues to sit on the outside of a tree branch he is sawing. When he cuts through the branch and falls to the ground with it, Hodja acknowledges the accuracy of the advice (Tale Type 1240. “Man Sitting on Branch of Tree Cuts It Off”). Other tales portray Hodja as cleverly outwitting or triumphing over antagonists. For instance, when refused entry to a vizier’s banquet to which he has been invited because of the way he is dressed, Hodja goes home, puts on his finest garments, returns, and is immediately granted entrance to the banquet hall and seated beside the host. When the soup course is served and the guests begin to eat, Hodja dips first one and then the other of the flowing sleeves of his robe into the soup, saying, “Eat, sleeves, eat. It is you who were invited, not I.” (Tale Type 1558. “Welcome to the Clothes”) (Georges 1980:110–114).

Persisting in the late 20th century mostly in the memories of older Greek immigrants to the United States is a body of folklore concerning ominous supernatural beings, which is on the wane in Greece as well. When prompted, some Greek Americans will still tell frightening stories about the *vrykólakas*, a nondecomposed corpse that leaves its grave, usually at night, to engage in acts that range from the mischievous to the violent. They also recall hearing about individuals’ encounters with *neráídhēs*, tall, graceful women adorned in flowing white dresses, who steal babies from their cradles and leave adults who encounter them unable to speak. Some can also describe the *kalikánzari*, dwarf-like beings who appear at Christmastime and engage in such mischievous tasks as overturning furniture and leaving things in household kitchens in general disarray. But most Greek Americans who remember such supernatural beings have little concern about, or interest

in, them today. Such beings and stories about them are from a different era and native to a country that now seems different as well.

Greenway, John (1919–1991)

Folklore scholar, teacher, writer, and performer. Greenway was born John Groeneweg in Liverpool, England, but became a U.S. citizen. Educated at the University of Pennsylvania, he received his doctorate there with a thesis that was later printed as the now standard work *American Folksongs of Protest* (1953). After a brief period as an English teacher at Rutgers University and the University of Denver, he switched to anthropology, teaching in that department at the University of Colorado through most of his career.

A versatile scholar and brilliant writer, he published books, monographs, and articles on subjects ranging from a handbook on James Joyce's *Ulysses*, to *Folklore of the Great American West* (1969), to studies and bibliographies in his specialty, the Australian aborigine. He edited or authored nineteen books; his complete bibliography is available in *Contemporary Authors*, IX (First Revision), p. 366. Two of his books, both published in 1964, were widely read: *The Inevitable Americans* and *Literature among the Primitives*.

Greenway also edited the *Journal of American Folklore* (1964–1968) as well as *Southwestern Lore* (1959–1963) and *Western Folklore* (acting editor, 1960–1961).

During the late 1950s and early 1960s, Greenway was active as a folksinger, making a number of records of protest songs and frequent concert appearances.

Groundhog Day

February 2, when the groundhog supposedly comes out of its burrow to check the weather. If the sun shines and the groundhog sees its shadow, there will be six more weeks of winter; if the day is cloudy or rainy, winter will come to an early close.

Groundhog Day originated in Europe, where Candlemas Day on February 2 marked the vernal equinox and the beginning of the growing season. In France the bear supposedly returned to its hole for forty days if the sun shone, while in Germany the badger did the same thing. One could expect a good planting season if the animal showed that winter would end soon.

In America local variations have placed Groundhog Day on either February 2 or February 14. Some traditionalists in Missouri, Arkansas, and Illinois have insisted that February 14 is the proper date, although an edict of the Missouri Legislature made Groundhog Day official in that state on February 2.

Groundhog Day is not a complex or sentimental holiday in the United States, but local traditions have made it memorable in some areas. In Punxsutawney, Pennsylvania, for example, the groundhog named "Punxsutawney Phil" is a minor celebrity whose picture and behavior become newsworthy on this one day of the year. Sometimes people gather for a Groundhog Day dinner. The movie *Groundhog Day* (1993) gave the holiday an unusual degree of commercial recognition; normally, however, Groundhog Day is a low-key and pleasant reminder of agrarian routines that have become increasingly distant from urban society.

Guillonée

French New Year's Eve questing ritual performed by costumed revelers; also, the particular song sung by these revelers. A wide range of popular and scholarly beliefs concerning its origin persists. Recent evidence supports Celtic derivation of *guillonée* from Breton *eginane*, which refers to cereal germ, or seed (Postic and Laurent 1986). Variants of this questing ritual are found in Celtic strongholds of Great Britain, throughout northern and western France, and in northern Spain.

In North America, *guillonée* is practiced in Quebec and in the Mississippi Valley, where it has continued uninterrupted since colonial times. The annual quest is particularly popular in the towns of Prairie du Rocher, Illinois, and Ste. Genevieve, Missouri. Performance of the Mississippi Valley *guillonée* has transformed rapidly in the 20th century as a result of social changes and loss of native French linguistic competence.

North American versions of the song all begin similarly:

Bon soir le maître et la maîtresse et tout le monde du logis.

Pour le dernier jour de l'année la guillonée vous nous devez.

(Good evening master and mistress and all who reside here.

On this last day of the year you owe us the *guillonée*.)

The following two lines, in some form, also occur in most variants:

On vous demande seulement la fille ainée.

On lui ferons faire bonne chère, on lui ferons chauffer les pieds.

(We ask you only for the oldest girl of the house. We will see that she becomes a dear sweetie, we will warm her feet.)

These lyrics suggest the *guillonée's* association with communal reciprocity and the coming-of-age of young women. Related French American mumming rituals include *La Chandeleur* of the French Canadian Maritimes; Mardi Gras of rural Louisiana; and various *Carnival fêtes* of the Caribbean.

Gulf War

American military engagement in the Persian Gulf area during the first half of 1991. The United States was part of a multinational force opposing the August 1990 invasion of Kuwait by Iraq. Despite the short duration of the conflict, the dominant military power of the United States and its allies, and the high-tech nature of the warfare, typical wartime folklore quickly appeared.

Already in late 1990, when the United States had troops in the area as a show of force (“Operation Desert Shield”), a rumor swept the country that the Pentagon, in anticipation of bloodshed to come, had special-ordered massive numbers of caskets to be shipped to Saudi Arabia. The alleged orders escalated from an early rumor of 10,000 to 23,000 eventually to as many as 40,000 or 50,000. “Those rumors are baloney,” one U.S. military spokesman said, while a Gannett News Service report in December 1990 concluded, “The casket story has bounced from sea to shining sea with enough strength for it to be nominated as an ‘urban legend.’”

On January 16, 1991, President George Bush ordered active U.S. engagement in the conflict to begin (“Operation Desert Storm”), commanded by General Norman Schwarzkopf. “No war or run-up to war is complete without its tales of atrocity,” an article in the *Nation* stated on February 4, 1991; the article went on to show that “the single most publicized atrocity was untrue.” The story, widely repeated by politicians and the press, was that Iraqi troops entering Kuwait City had raided hospitals, removing more than 300 premature babies from incubators, which were then shipped to Baghdad. Amnesty International, at first accepting the report, inquired further after the end of the war in April 1991 and “found no reliable evidence that Iraqi forces had caused the deaths of babies” by such means or in such numbers.

A homefront horror story described an injured Gulf War veteran telephoning his parents from the hospital to ask if he might bring home a wounded comrade who was both blind and a multiple amputee. The parents said no, that this would be too much of a burden on them, so their son killed himself, since he was describing his own injuries. The vet realized that his parents would never be able to accept him again in his condition.

Many other rumors, tales, and warnings relating to the Persian Gulf War circulated by word of mouth, on radio talk shows, and over the Internet. A frequent theme was “amazing coincidences”—things that may have happened in reality but were modified and exaggerated as the tales were repeated. Typically, an American soldier opens a letter or a package of cookies addressed to “Any Soldier” and finds that it was sent by a relative of his as part of an organization’s “support our troops” effort. Another common notion was that an Iraqi prisoner spoke fluent American English, wore American clothing, and was eager to be “captured,” since he was a U.S. citizen who happened to be visiting relatives in Baghdad when the war broke out. A group calling itself Mothers against Saddam Hussein (MASH) warned that return addresses should be removed from discarded envelopes containing mail from home, because the enemy was collecting

addresses from the trash to target American families for terrorist attacks. Stateside, yellow ribbons were widely displayed as symbols of support for our troops.

The advanced electronic weaponry employed in the Gulf War produced its own folklore, including accounts of incredible accuracy that were contradicted by other reports of failures of equipment or errors in strategy. One amusing story claimed that on an island in the Gulf that was controlled by the enemy, the Iraqis had put up wooden decoys of military vehicles and installations, hoping to fool the American bombers. Supposedly, after Air Force intelligence recognized the trick, the bombers retaliated by dropping decoy bombs onto the decoy targets.

Anti-Iraqi riddle jokes by the hundreds were circulated, picturing the enemy as inept, ill trained and poorly supplied, and hopelessly outclassed in the conflict. Some examples:

What do Hiroshima, Nagasaki, and Baghdad have in common?

Nothing, yet.

How do you get 100 Iraqis on a twenty-passenger bus? Throw in an MRE. ("Meals ready to eat," American combat rations, disliked by our troops, but allegedly superior to anything the enemy had to eat.)

What do the Iraqis use sandpaper for? Maps.

Why is it so easy to teach Iraqi pilots how to fly?

Because you don't have to teach them how to land.

Newspaper editorial cartoons satirizing or criticizing Saddam Hussein, Iraq's president (referred to by President Bush as "The Butcher of Baghdad"), were recopied and posted, while numerous anonymous photocopied drawings and fliers appeared. A favorite was a poster for the "Baghdad Air Show of 1991," which advertised the bombardment of the Iraqi capital as being merely an aerial firepower demonstration. One cartoon showed an American fighter jet chasing a camel-riding Hussein out of Kuwait with the caption (borrowed from a cigarette ad) "I'd fly 7,000 to Smoke a Camel." There were several variations of the "weapons versus camels" theme, including one that showed a supposed Iraqi mobile Scud mis-sile launcher consisting of a camel with the missile in its mouth, having its testicles struck with a mallet. Another cartoon was in the form of a dart board inviting the player to choose the punishment for Saddam Hussein's war crimes; each subsection of the board offered another bizarre torture, including "Feed him to the Israelis."

Israel had agreed to remain passive in the face of missile attacks and the fear of chemical warfare from Iraq. This unaccustomed wartime role spawned numerous grim jokes, such as:

What is Israeli roulette?

Three gas masks and four people in a sealed room.

What does Scud stand for?

Saddam Comes Again Damn-it!

Hev. but Scud is spelled with a "U."

True, but Saddam doesn't know English.

What's the similarity between Scuds and married love making?

Both start at the frequency of five times a night and finish with one time every five nights.

The abrupt end of the conflict in April 1991 with the Iraqi government accepting allied surrender terms was followed by widespread charges that high-tech American weapons used in the Gulf War had not performed as perfectly as the government claimed. An aura of folklore cloaked the subject, as, for example, in NBC News commentator John Chancellor's remarks (published in the *New York Times*) that the war had created "facts misperceived, truth bent out of shape, and a fog of myth and misconception."

Gummere, Francis Barton (1855–1919)

Literary theoretician, philologist, medievalist. Gummere was born in Haverford, Pennsylvania, the son of the then president of Haverford College. He received his A.B. from Haverford in 1872, and in 1875 he was awarded an A.M. from Haverford and an A.B. from Harvard College, where he had studied under Francis James Child. He then went on to study at the Universities of Strasbourg, Berlin, and Freiburg, from which he was granted a Ph.D. magna cum laude.

Though he taught for a few years at two different preparatory schools and was an instructor for the academic year 1881–1882 at Harvard, where he was a colleague of George Lyman Kittredge, he spent most of his academic career as professor of English at Haverford College (1887–1919). He was also the fifteenth president of the Modern Language Association of America.

Gummere devoted his scholarly life to the study of the origins of literature. Thoroughly indoctrinated in the methodological techniques of the German philologists, he theorized that at one time in history poetry was the product of everyman, the theory on which two of his books—*Germanic Origins* and *The Beginnings of Poetry*—are based. He became the principal proponent of the theory of communal origins for the traditional ballad, a theory based upon his understanding of the concepts promulgated by the brothers Grimm, especially those of Jacob, and by his interpretation of a statement that Gummere attributed to them, “*das Volk dichtet.*” From its introduction in 1897 until the 1930s, the theory served as an often misinterpreted foundation for ballad scholarship.

Guthrie, Woody (1912–1967)

Singer of traditional songs, songwriter, poet, novelist, artist, and a major influence in the urban folk revival, the folk-rock movement, and social-protest song writing. Born on July 14, 1912, and named after the Democratic presidential nominee Woodrow Wilson, Guthrie was the third of five children born to Charley and Nora Guthrie in Okemah, Oklahoma; his parents were a popular, prosperous couple with the prospect of a successful small business and good middle-class family life. Charley was a Texan who entered Indian Territory (now Oklahoma) as a cowboy, and Nora was the daughter of a schoolteacher who had come to the territory from Kansas. As a child, Woody heard his father sing cowboy songs and his mother play the piano and sing “old” ballads.

When Woody was approximately six years old, unforeseen and misunderstood problems hit the family with destructive force. His older sister died from burns, and his mother exhibited symptoms of Huntington’s disease. However, the family, the community, and Woody’s friends believed her to be losing her mind. The family slowly disintegrated. Charley lost land holdings, cattle, and other collateral, and Nora’s illness intensified.

A few months before his fifteenth birthday, Woody had to become self-sufficient, for his father was severely burned and his mother was committed to the Oklahoma Hospital for the Insane, where she later died. Charley was taken to Pampa, Texas, where relatives nursed him back to health, but Woody remained in Okemah and for a few months lived in a club-

house that he and friends had built. For the next two years, he stayed with different families during the school year and hitchhiked or hoboed his way to south Texas to stay with friends during the summer. He made living money by picking up junk in back alleys, washing and polishing spittoons to pay rent on a shoe shine stand, selling newspapers, and working at other odd jobs.

In high school, Woody sang in the choir, was the “joke editor” for the school annual, and often entertained fellow students with his harmonica, his wit, and his jig-dancing skills. He was a popular student, but in 1929 at the end of his junior year in Okemah High

School, Woody joined his father in Pampa. The following year, the drought and dust storms started, and they lasted through the entire decade. Even though he later became known as the “Oklahoma Dust Bowl Balladeer,” it was Pampa, where he experienced his Dust Bowl years, that provided inspiration for many songs. These and subsequent events in Woody’s life are described in his autobiographical novel *Eound for Glory* (1943).

While in Pampa, his uncle, Jeff Guthrie, and other friends taught Woody to play the guitar, fiddle, banjo, and mandolin; he played in a Junior Chamber of Commerce cowboy band, worked for a bootlegger, and painted signs, but mostly he played at dances and entertained with his uncle. In October 1933, he and Mary Jennings married; unfortunately for Mary, Woody was more interested in making music, writing, and traveling than in providing for a family. For a few months, Woody, Mary, and his uncle and aunt traveled with a small medicine show, but when the owner went broke they had to return to Pampa. There, in 1935, Woody wrote a few poems and parodies of popular songs that still survive as evidence of his early writing interests.

In November 1935, their first child, a daughter, was born, but Woody still had no motivation for steady work. When he made money from singing, he often gave it to someone he thought needed it more than he—his childhood experiences had instilled a compassion for the poor and downtrodden. A few months before a second daughter was born in July 1937, Woody’s wanderlust drove him westward to California.

He stayed with relatives in the Los Angeles area and started playing music with his cousin, Jack Guthrie, who played a variety of stringed instruments and sang in the style of Jimmie Rodgers. Woody developed a musical style similar to the Carter Family, so he and Jack did not sing as a duo but played backup music for each other. In August 1937, Jack arranged a radio show for them over KFVD, Hollywood, and they quickly attracted a following of fans. Jack had to leave the show for work that would support his family, so Woody and Maxine “Lefty Lou” Crissman, a young lady whose family was close to Jack and had taken Woody as a friend, became a musical team. The “Woody and Lefty Lou Show” drew thousands of fan letters over a few months’ time and made a little money for them.

His family joined him in California, and a few months later Woody and Lefty Lou accepted a lucrative offer to broadcast for XELO in Tijuana, Mexico. Woody’s propensity for saying what he believed, often with humor, angered Mexican officials, and in a short time they were banned from Mexico. Woody returned to KFVD, where he became acquainted with a radical news commentator, Ed Robbins. Through Robbins, Woody became interested in left-wing political and social activities and attended activist meetings along with movie stars and other lesser-known individuals seeking solutions for Depression-era problems. He soon was writing a column “Woody Sez,” in the style of his hero Will Rogers, for the Communist newspaper *People’s World*.

During the approximately eighteen months he sang at KFVD, Woody wrote “Oklahoma Hills,” “Philadelphia Lawyer,” “Do, Re, Mi,” “Ship in the Sky,” and many other songs and became acquainted with the man who became his traveling and recording companion, Cisco Houston.

In 1939 with his actor friend Will Geer, Woody traveled to New York City, where he met Alan Lomax, Pete Seeger, and others influential in what became the urban folk revival. In 1940 Lomax invited him to Washington, DC, where Woody recorded songs for the Library of Congress, and one month later in New York City, he recorded his *Dust*

Bowl Ballads for RCA Victor, later recording a few songs for smaller companies. In 1941 he and his family traveled to Pordand, Oregon, where he wrote twenty-eight songs in twenty-eight days for the Bonneville Power Authority, including “Roll on, Columbia” and “Pastures of Plenty.”

The early 1940s were important creative years during which Woody wrote “So Long, It’s Been Good to Know You,” “Tom Joad,” “This Land Is Your Land,” and *Bound for Glory* and started his second family with Marjorie Mazia. He sang and recorded with the Almanac Singers and appeared on numerous radio shows, such as *Pipe Smoking Time*, *Pursuit of Happiness*, *We the People*, *Cavalcade of America*, and *Back Where I Come From*. During this time, he and Cisco Houston joined the Merchant Marine and were on three torpedoed ships, and as World War II neared its end he was drafted into the Army, where he spent less than one year.

In 1944 Woody met Moses Asch, the founder of Asch Records and Disc Records, and started a recording friendship that lasted until 1950. During those six years, Woody recorded approximately 200 sides, possibly more, for Asch. The master recordings that survive are in the Asch/Folkways Collection now owned by the Smithsonian Institution. Not only did he record his own songs, but he also recorded numerous traditional and country songs, most of which he knew before becoming a participant in the folksong scene. He used and/ or adapted melodies from this vast storehouse of songs for many of his tunes.

By 1950 Woody was showing symptoms of Huntington’s disease, the genetic illness that killed his mother, and, as had happened with his parents, his personal and family life slowly disintegrated. His wandering increased as his creativity decreased, and he and Marjorie divorced. A short-lived third marriage also ended in divorce after Woody was finally hospitalized in 1955.

In his productive years, writing was an obsession with Woody, words flowed onto paper as easily as speech from his mouth—almost in a stream-of-consciousness style. His prose, poems, and song lyrics were laced with humor and vivid description. When he was inspired, or occasionally was paid, to write about a topic, an event, or a person, he would sit at the typewriter for hours, writing until all thoughts and inspiration were on paper, and usually a body of songs or poems would be written. His inspiration might come from a newspaper article, a movie, a conversation, or just from observing people.

Equal to his obsession with writing, Woody was a voracious reader who wrote his interpretations, reactions, and beliefs in the margins of the books he read. From the Okemah Public Library to the New York City Public Library, wherever he went, he obtained books to read. He knew world and U.S. history; he knew the theories of political and economic science; and he knew the Bible extremely well. He was capable of adjusting his grammar and speech to please the individual or crowd to whom he was speaking, but he always preferred to play the role of the “Grapes of Wrath Okie.”

He wrote well over 1,000 songs—songs that document the Dust Bowl decade and problems confronted by migrant agriculture workers, children’s songs, peace and war songs, cowboy and hobo songs, union and work songs, and love songs; and during his short creative period of approximately fifteen years, he also wrote three novels, short stories, newspaper columns, magazine articles, and hundreds of letters and drew hundreds of illustrations for his songs and books. After approximately thirteen years of hospitalization, Woody Guthrie died on October 3, 1967.

During his hospitalization and following his death, fame and recognition grew through numerous musical tributes to him and through the efforts of Pete Seeger, who usually included a Guthrie song in his concerts. Marjorie Guthrie, his second wife (although divorced from him) lectured about and lobbied for Huntington's disease research, making Woody an international symbol of the effects of the disease. Arlo Guthrie, the older son born to Woody and Marjorie, also gained fame as a folk and topical singer/songwriter with his satirical "Alice's Restaurant" and his rendition of Steve Goodman's "The City of New Orleans"; he also includes songs by his father in his concerts and recordings, and he and Pete Seeger have given numerous concerts and recorded together and have appeared at many Woody Guthrie tributes. Woody Guthrie's reputation as a multitalented, creative man continues to grow long after his death.

Gypsies

A popular misnomer (derived from “Egyptian”) referring to an ethnic group of Indian origin numbering more than one million in the United States and about ten million worldwide. Linguistic observation in late-18th-century Europe led to the discovery of the Gypsies’ Indian roots. North American Gypsy populations all speak some form of Romani, an Indian language similar to Sanskrit with overlays from Persian, Armenian, Byzantine Greek, South Slavic, Romanian, and several Romance languages. Gypsies call themselves *Rom* or *Roma* and those outside their own ethnic group *gazhe* or some variant of the term. Comprised of several subgroups with distinct histories, the *Roma* share a core culture consisting of the Romani language and an intuited cosmology of structural oppositions (God/devil, good/evil, purity/pollution, *Roma/gazhe*). This worldview informs many Romani traditions, particularly a strict boundary maintenance between *Roma* and *gazhe*.

After their departure from India (sometime before A.D. 900), the *Roma* dispersed into many countries, where they were generally feared, persecuted, or executed because of their unfamiliar appearance, language, customs, and religious beliefs. Records documenting their arrival in eastern Europe in the Middle Ages emphasize the *Roma*’s dark hair and complexion as symbolic of incarnate evil. They often suffered when Christians misidentified them as Muslims, especially during the late medieval period when Christendom was threatened by Islamic invaders.

Paradoxically, while the *Roma* were frequently persecuted as unbelievers in Christian countries, they were often forced to worship outside the established church when they became Christians. In much of Europe, Gypsies were prohibited from entering Catholic churches until the late 19th century. At the close of the 20th century, many *Roma* in the United States are folk Catholics, practicing a syncretistic religion that draws some (more ancient) elements from Zoroastrianism and Hinduism (such as animal sacrifice, herbal healing, use of household shrines) and others from Eastern Orthodox Catholicism (such as monotheism, belief in the efficacy of prayer and the saints’ intercession, and celebration of the saints’ days and festivals of the Eastern Orthodox calendar). Several thousand North American *Roma* have joined the significant Romani evangelical movement and consider themselves “born-again” Christians.

In the 1990s, the *Roma* are a little-known group in the Americas but constitute the largest non-White minority in Europe. In each European country where a Romani group has settled without the recent threat of expulsion or extermination (such as France, Spain, and the British Isles), their language and culture have altered under the influence of those of the host nation. In Great Britain, they are called Romanichals and speak Anglo-Romani (which retains much of the lexicon but little of the grammar and syntax of earlier Romani). In Spain they are known as Gitanos and speak Caló. Romani subgroups have developed distinct identities, and representatives of those European populations have emigrated to the Americas at different times for varying reasons. In the United States, scholars have focused on one such Romani subgroup: the Kalderash (Russian

Coppersmiths). Ancestors of American Kalderash lived in Russia until the late 19th and early 20th centuries, and, as a result, Kalderash Romani contains many Russian and Slavic loan words and combining forms.

Linguistic assimilation is probably the least oppressive of the negative forces that the *Roma* have historically endured. Throughout their millennium-long diaspora, they have withstood not simply marginalization (perhaps in part a natural result of their own cultural prohibitions on interaction with outsiders), but also persecution and even genocide. They were enslaved for more than 500 years (until 1864) in the Balkans, and more than half a million were exterminated in the Nazi regime's Final Solution. While Romani-Americans do not suffer the intense persecution apparently endemic to many European countries, they face widespread stereotyping and prejudice. Organizations active in combating persecution of *Roma* include the International Romani Union (which sends a delegate to the United Nations) and the Romani Congress. After then Prime Minister Indira Gandhi officially recognized the *Roma* as an expatriate Indian population, the Indian government was able to assist in financing the first world Romani Congress, which was held in 1971 and included several Indian delegates.

As the stereotypical "Gypsies," the Romani people have inspired a huge body of expressive culture and oral tradition. The word "Gypsy" has developed into a synonym for a range of stock characters and fanciful beings of American folklore and popular culture: the clever trickster, the happy-go-lucky vagabond, the irresponsible itinerant, the mysterious soothsayer, and the picturesque free spirit. Elite and popular art, literature, and music—from the Victorian era to modern-day Hollywood—have used the Gypsies collectively as a convenient vehicle for fantasies of freedom, escape, and licentiousness.

While the Gypsies of folk and popular culture are largely irrelevant to actual North American Romani life, one point of intersection is fortune-telling, still a source of livelihood for some Romani-American families who make solid commercial use of their secure traditional identity as psychics, astrologers, palm readers, and Tarot-card readers. An outstanding example of the successful marketing of expressive culture, this ubiquitous element of the colorful stereotype of Gypsy life is likely to endure for another thousand years in spite of frequent legal and religious prohibition. Fortune-telling—like other exoteric entertainment functions of the Gypsies—is rooted in the *Roma*'s proficiency in absorbing, transporting, and marketing folk and popular culture throughout their history. Various Romani groups possess rich oral-performance traditions not limited to their skills in fortune-telling: Folk and popular music, folktales, myths, legends, proverbs, riddles, jokes, memorates, and other folkloric forms have been observed in contemporary Romani performance tradition in Europe and North America.

Over the centuries, the *Roma* have survived through fortune-telling and other forms of entertainment, agricultural work, metalwork and munitions manufacture, horse trading, and other similarly portable, flexible occupations. Many modern-day Romani-Americans pursue careers in industry and the professions, while others have selected more traditional means of livelihood such as fortune-telling; auto-body and fender repair, boiler repair, re-tinning, copper-plating, metal recycling, and other metalwork; and used-car sales (perhaps a descendant of horse trading). Many of the older generation of Romani-Americans were once migrant agricultural workers, a form of livelihood still common to the Romani population in the British Isles but rare among *Roma* in the United States in the 1990s.

Romanologists disagree as to when and why the *Roma* left India. Until recently, the predominant hypothesis identified modern-day *Roma* as descendants of 10,000 Luri musicians given to the ruler of Persia by his brother, the sovereign of India, in A.D. 439. However, recent research in India itself has exposed evidence that the *Roma's* exodus from India may have occurred somewhat later, perhaps in the 8th or 9th century. According to this theory—promulgated at first by a few scholars but now gaining more extensive acceptance—the Indian forbears of modern-day *Roma* were a group of Rajput warriors and their camp followers who moved westward into Persia for reasons associated with the Indo-Persian wars and later, instead of returning to India, continued traveling farther and farther west.

Halloween

October 31, the eve of the Christian feast of All Saints, or All Hallows, which is November 1. The day is known also as All Hallows' Eve, the Eve of All Saints' Day, All Hallow Even, or Hallowe'en; the terms "mischief night," "cabbage night," and "devils' night" are sometimes associated with the holiday

May 13 had been established as a feast for St. Mary and the Martyrs by Pope Boniface IV in A.D. 610, in order to honor all Christians who had died for their faith but were not officially recognized. In A.D. 731, All Saints' Day was established on November 1 by Pope Gregory III. The evening prior to the feast, the Eve of All Hallows, or All Hallow Even, has become known as Hallowe'en or Halloween. Many scholars have noted the apparent continuity of traditions with the ancient Celtic quarter day known as Samhain, November 1, and have suggested that the church fathers were attempting to redirect the religious devotion of that day toward a Christian feast while redefining the customary behavior in a Christian context. This would account for the continuity of activities such as mumming (performing, often in costume, in return for gifts of food and drink,) along with the belief that the evening was a time of wandering spirits.

Samhain (pronounced Sah-win) was the first day of both winter and the Celtic New Year and was also a time for the souls of the dead to pass into the otherworld. Little is actually known of Samhain; it is referred to in Irish sagas written down between the 9th and 12th centuries, hundreds of years after the times to which they refer. Although oral versions of these narratives would certainly have been much older than these sources, the written narratives are not contemporaneous with the festival itself. According to these sagas, Samhain is the principal festival of the four quarter days, each of which begins a new season. Dead souls were believed to be traveling; people left offerings for them; bonfires were lit; and, eventually, mumming traditions developed. Around A.D. 1006, the church declared November 2 as All Souls' Day. This day is in recognition of the souls of all of the faithful departed who had died during the previous year. In this way, it is closer in spirit to the Celtic Samhain than is All Saints' Day.

Through its missionaries, the church also redefined the beliefs along with the rituals and practices of the peoples it converted. The spirits associated with Samhain, once thought to be wild and powerful, were now taught to be something worse: They were evil. The church maintained that the gods and goddesses and other spiritual beings of traditional religions were diabolical deceptions, that the spiritual forces that people had experienced were real but were manifestations of the devil, the Prince of Liars, who misled people toward the worship of false idols. Thus, the customs associated with All

Hallows Eve included representations of ghosts and human skeletons—symbols of the dead—and also of the devil and other creatures said to be malevolent and evil. A direct link between Samhain and Halloween has never been demonstrated, however, and is disputed by some scholars.

Marginal, supernatural creatures such as fairies and witches have been associated with Halloween over the centuries. The traditional British ballad “Tam Lin” (Child 39) gives a detailed account of the belief in the great fairy rides on Halloween, while the day is said by many to be the highest feast day of the year for witches. The association of Halloween with the souls of the dead continues to be very strong. In parts of Ireland in the late 20th century, Halloween is thought to be a night when the spirits of departed ancestors return and visit their households. Frequently, people leave their hearth burning and set out plates of food or drink.

As a seasonal turning point, Halloween has always been related to the agricultural and pastoral cycles as well. By this date, crops should be harvested and livestock brought in from pasture. The seasonal and organic relationships are manifested in the frequent uses of apples, nuts, and turnips (pumpkins in North America) in the games and rituals associated with Halloween. Many of these reflect the day’s liminal status as an annual and seasonal day of transition, in which barriers between this world and the world of spirits are lifted. Often, the games are divinatory in nature. For instance, in one popular game, nuts are named for two individuals and set near a hearth

where they are "burned," or heated by the flame. If the nuts crack and explode, the couple cannot expect a long or happy relationship. If the nuts roast quietly, the opposite is true. In other divinatory rituals, apples are used to foretell future spouses. Such games are many, and frequently involve the use of an edible item, harvested at about this time of

year, to foretell the future. In fact, the connection between harvested fruits and nuts and Halloween is so strong that Halloween is often called Nutcrack Night in Ireland.

Other games and customs also are divinatory. In some it is said that the participants call forth the devil for knowledge of the future. More often than not, these events provide the subject matter for frightening stories told among family and friends at Halloween. In all of this can be seen the combining of various elements associated with Halloween: ideas of spirits and other supernatural beings roaming, the association of these with evil in the Christian era, the use of harvest symbolism, along with traditions of food, stories, bonfires (fireworks in Northern Ireland), and other family and community gatherings. In addition to all of these, possibly inspired by beliefs in malevolent beings lurking about, or perhaps due to the liminality of the day, pranking has long been a part of Halloween activities. In Ireland, these are done usually for several weeks in advance of Halloween, as is Halloween rhyming (begging for fruit or money, like pranking done by children). Halloween night itself is usually given over to family celebrations.

Halloween beliefs and customs were brought to North America with the earliest Irish immigrants, first the Ulster Protestants, commonly referred to as Scots-Irish, then by the great waves of Irish immigrants fleeing the famines of the first half of the 19th century. Known in the North American continent since colonial days, by the middle of the 20th century Halloween had become largely a children's holiday. More recently, however, Halloween has grown dramatically in popularity in the United States. Adults have begun celebrating it in great numbers with masquerade parties, elaborately decorated houses and yards, campus festivities, and urban street celebrations all around the country. As a large-scale, outdoor, costumed adult street festival, Halloween has become reminiscent of Carnival and Mardi Gras. Both the street festivals and the assemblages of symbolic elements used to decorate houses and commercial establishments, however, are consistent with Halloween tradition and history. Harvest images such as jack-o-lanterns are seen alongside personifications of death, such as ghosts and skeletons, and evil, such as devils and witches. Alongside the manifestations of ancient fears are representations of contemporary monsters and plagues as well, drawn from popular entertainments, politics, and current events.

Although Halloween is not a national holiday in the United States, it is widely celebrated. Different groups perceive it in different ways, and many people are uncomfortable with its imagery of devils, witches, and demons. Others see this as merely playful, while still others see these images as reflecting a history of suppression and distortion of non-Christian religious practices. In spite of its controversial nature, Halloween has grown to become second only to Christmas as a major annual participatory festival. Despite its connection with the church calendar as the eve of All Saints' Day, many people believe Halloween to be nondenominational in nature. Despite the vast quantities of advertising and commerce surrounding it, many also believe that Halloween is noncommercialized. It is celebrated at the end of the 20th century as a time when threatening images and ideas are paraded and parodied, when taboo behavior is tolerated and even encouraged. Halloween in America is a festival of inversion that still speaks not only of death but of contemporary life as well.

Hand, Wayland D. (1907–1986)

Folklorist and Germanist. Born on March 19, 1907, in Auckland, New Zealand, where his parents had immigrated, Hand returned as a young child with them to the United States and eventually settled in Utah, where he spent his early years. After graduating from high school, Hand went in 1927 on a Mormon mission to Germany, where he remained for almost three years, developed an interest in German literature and culture, and became fluent in German. After his return, he studied German at the University of Utah, from which he received his B.A. in 1933 and his M.A. in 1934. He then went to the University of Chicago, where he earned his Ph.D. under Archer Taylor with a thesis *The Schnaderhüpfel: An Alpine Folk Lyric*, which was published by the University of Chicago Press in 1936.

After teaching German for one year at the University of Minnesota, Hand joined the faculty of German Languages at UCLA, where he remained for the remainder of his career and where he developed an interdepartmental teaching program and research institute in folklore—the Center for the Study of Comparative Folklore and Mythology. He also built up the folklore collection in the University Research Library to become the best of its kind in the world. In 1941, together with Archer Taylor, he founded the California Folklore Society. From 1947 to 1951, he was editor of the *Journal of American Folklore* and later assumed the same position for *Western Folklore* (1954–1966). He was president of the American Folklore Society from 1957 to 1958 and of the California Folklore Society from 1969 to 1970.

Hand conducted field research among miners in Montana, Utah, and California, publishing his findings in a series of articles from 1941 to 1946. He also published a *Dictionary of Words and Idioms Associated with Judas Iscariot* (1942). In addition, he authored many articles on such wide-ranging topics as the Mormon legends of the three Nephites, German proverbs in Los Angeles, folksongs, and folk customs. However, it was in the area of popular belief and superstition in which Hand made his greatest and lasting impact. Assembling materials collected from the field and culled from thousands of publications, both scholarly, ephemeral, and popular, he compiled the UCLA Archive of Popular Beliefs and Superstition. Hand's classification system developed through the years formed the basis of his edited works, including the two-volume *Popular Beliefs and Superstitions from North Carolina* (1961–1964), the three-volume *Popular Beliefs and Superstitions: A Compendium of American Folklore from the Ohio Collection of Newbell Niles Puckett* (1981), and *Popular Beliefs and Superstitions from the Anthon S. Cannon Collection of [Utah] Folklore* (1984). Hand's system became the model upon which archives of belief materials have been arranged around the world. For the North Carolina collection, he was awarded the Giuseppe Pitrè International Folklore Prize in 1965. In 1972 the government of Finland inducted him as a Knight First Class in the Order of the Lion.

Hand also published extensively on the related topic of folk medical practices, calling the attention of scholars to such practices as “crossing water,” “measuring,” “magical

divestment and transference of disease,” “passing through,” “plugging,” and healing with the “dead man’s hand.” Most of these essays and others were compiled in a single volume, edited by Hand, titled *Magical Medicine* (1980).

On October 22, 1986, while changing planes in Pittsburgh on a trip from Detroit, where he was enlisting help for his projected *Encyclopedia of American Popular Belief and Superstition*, to Baltimore, where he was to participate in the annual meeting of the American Folklore Society, Hand died of sudden cardiac arrest. His UCLA coworkers are continuing work on his *Encyclopedia*.

Handcox, John L. (1904–1992)

African American songwriter, poet, and organizer for the Southern Tenant Farmers Union (STFU) in Arkansas and Missouri in 1936–1937. In the spring of 1936, having escaped from a possible lynching in eastern Arkansas for his efforts in organizing sharecroppers and farm workers who were being evicted from their homes, Handcox wrote “We’re Gonna Roll the Union on” and “There Is Mean Things Happening in This Land.” During this time, he became known as “The Sharecropper Troubadour” (Mitchell 1979). In March 1937, while on a fund-raising tour for the Socialist Party in the Northeast, Handcox recorded eight songs and poems at the Library of Congress (Library of Congress Recording AFS 32/37–39). His songs have frequently been published in anthologies of American folk music. “Raggedy, Raggedy Are We” was popular at STFU meetings, and “Roll the Union on” remains a popular song at union meetings and on picket lines.

Handcox moved to Oklahoma in 1937 and then to San Diego, California, in 1942, working primarily as a carpenter and having no contact with union activists, although Pete Seeger had tried to locate him. Reunited with his old friends in 1980, Handcox resumed his writing and performing of poems and songs about labor issues. He performed in Washington, DC, every year from 1980 to 1991, as well as at festivals and gatherings in other locations. In 1985 he was interviewed at the Library of Congress on his labor activities and his music (AFS 241111). In 1989 the Labor Heritage Foundation gave the first annual Joe Hill Award to Handcox for his contributions to labor.

Handy, W.C. (1873–1958)

Popularizer of blues, sometimes called “Father of the Blues.” Although an enormously important figure in the history of American music, William Christopher Handy’s full career has never been investigated objectively, and his own statements and writings are the main sources of information. Handy helped develop his own legend, and his accounts sometimes differ in detail or are not entirely congruent with data from other sources.

Handy was born and raised in Florence, Alabama, the son and grandson of Methodist ministers. Although he grew up in the midst of African American folk music, he initially rejected it to pursue the formal study of music and a career in popular music. During the late 1890s, he was leader and cornet player in a minstrel band that traveled in the United States, Mexico, and Cuba. Around 1903 he took a position as leader of a band associated with a Black fraternal organization in Clarksdale, Mississippi. There he turned his attention to folk music, especially the new blues form, after observing its growing popularity in the Delta region. By 1907 Handy had a similar position as band leader in Memphis. His band was hired in support of the 1909 mayoral campaign of E.H. Crump, during which it introduced an arrangement of a folk tune called “Mister Crump.” Handy added blues strains to this tune and published it in 1912 as “The Memphis Blues,” the first song to use the word “blues” in its title. This was followed by the publication of “Jogo Blues,” “St. Louis Blues,” “Yellow Dog Blues,” “Joe Turner Blues,” “The Hesitating Blues,” “Beale Street Blues,” “Loveless Love,” and others, all of which drew material and inspiration from folk-music sources.

In 1917 Handy made his first commercial recordings as a band leader, and he continued to record sporadically through the 1930s. In 1918 he moved to New York City, where he increasingly concentrated his activities on music publishing and solidifying his reputation through public appearances, writings, and collaborations. Beginning in the 1920s, Handy gradually shifted his attention to the publication of his arrangements of Negro spirituals, also treating African and Latin

American themes and creating works of “serious” music with various collaborators. He was honored during his lifetime with the dedication of a park in his name on Beale Street in Memphis in 1933 and the erection of a statue there after his death.

In the 1920s Handy was interviewed by folklorist Dorothy Scarborough as her main authority on the origins and meaning of the blues. Handy published an anthology of his own and other songwriters’ blues compositions (Handy 1926), later revised and expanded. He also published a survey of Negro composers (Handy 1938) and his autobiography. Over the years, he collaborated with many prominent musical, artistic, literary, and business figures and was a leading participant in the Harlem Renaissance of the 1920s. Handy is significant as a great composer who recognized and utilized folk traditions and as the first major popularizer of the blues. Throughout his career, he upheld

and defended the dignity of African American folk music and did much to promote the works of its purveyors and popularizers.

Harris, Joel Chandler (18487–1908)

Author best known for his collections of tales told by Uncle Remus. Harris is arguably one of the earliest and most significant collectors of African American folktales. His Uncle Remus works exemplified and helped popularize American folklore at the time when Americans began to organize scholarly folklore societies.

Harris grew up in poverty in Georgia. From 1862 to 1866, he worked as a printer's apprentice on a nearby plantation. After the Civil War, he worked as a typesetter and editor for newspapers in Macon, Forsyth, and Savannah. In 1876, fleeing a yellow fever epidemic in Savannah, Harris moved his family to Atlanta, where he accepted a job as associate editor of the *Constitution*. He stayed with that newspaper until he retired in 1900.

Although he worked daily for the newspaper, Harris is best remembered for his other writing. He wrote a wide range of works, from historical romances to children's stories. The most significant for both folklore and literature are those African American folktales in the Uncle Remus collections. From 1876 to 1879, Harris created a series of humorous sketches for the *Constitution*. Their success began with the development of the character of Uncle Remus—especially his past on the plantation—in “Uncle Remus as a Rebel,” later revised and reprinted as “A Story of the War.” In 1879 Harris returned Remus to the plantation and had him tell stories to the young son of the plantation's owners. Those animal tales, about Brer Rabbit, Brer Fox, and the other animals, were so popular that Harris collected these newspaper columns and published them in *Uncle Remus: His Songs and Sayings* ([1880] 1881). Harris wrote in the Introduction that the tales were not his own but were recollected from his youth on the plantation and verified as still in oral circulation. American folklorists, struggling to describe what American folklore was and why it was important, quickly recognized the book's value.

Harris followed this collection with others in 1883, 1889, 1892, 1905, and 1907, with posthumous volumes appearing in 1910, 1918, and 1948. He was careful to distinguish folktales—those still in oral circulation—from others. The folktales became Uncle Remus tales; other narratives were used in different ways, some of them appearing in his Thimblefinger Series of children's books. Harris did not write only of middle Georgia or African American culture either. He published a number of books with stories about north Georgia “crackers,” for instance, and Remus swaps tales with storytellers from other regions and traditions, including several who tell their tales in gullah.

Harris insisted that he was only a “cornfield journalist,”

Joel Chandler Harris, sitting on the front porch of his home, Wren's Nest, in 1900. Library of Congress.

but he was hardly naive about folklore. He was a member of the (English) Folk-Lore Society and a charter member of the American Folklore Society in 1888. His Introduction to *Nights with Uncle Remus* (1883) proved that he had read widely in folktale scholarship and knew the issues of the day. He had quit the American Folklore Society by 1892, however, apparently rebuffed by its leaders' call for "scientific" study.

Harris also edited several popular collections that remain valuable records, especially *American Wit and Humour* (1907) and the seventeen-volume *Library of Southern Literature* (1909–1923). He was one of many American writers who have utilized folklore in their work. Harris had a profound impact because his Uncle Remus works exemplified to a wider culture exactly what American folklore was, how it was transmitted, and why it was important to record.

Henry, John

Legendary African American folk hero, renowned mostly in song for competing with a steam hammer in laying railroad track. John Henry should not be confused with John, also the hero of many African American tales called the “Old Marster and John tales.”

Origins of the John Henry legend are often linked to the Big Bend Tunnel built in West Virginia in the early 1870s. Despite meticulous research, scholars have given up hope of determining the truth of John Henry’s exploits. Most folklorists now agree that the impact of the tale—a Black workingman defeating a modern machine—lies in the fact that the story can be proved neither true nor false. Any truth has been obscured by the reality of Black laborers in the South, born slaves or into a South struggling against Reconstruction. Antebellum naming practices would have given John Henry either no last name or the last name of his former owner. Research by Guy Benton Johnson found at least eleven John Henrys and reason to believe there were many more (Johnson 1929:12).

Tunneling—the setting for the John Henry story—is, of course, hard, demanding, and dangerous work. At the time, the Big Bend Tunnel was the longest of its kind, and it stretched beyond the limits of what safety and technological measures would have been available. Tunnels were hot and dusty; miners died from silicosis, heat prostration, rock slides, premature blasts, or even from sheer exhaustion. The most dangerous work was at the heading, where a small section was cut out in order either to cut down the remaining rock or to blast it out with explosives. John Henry was said to be a driver, one who pounded steel drills into the rock face in order to bore the holes for the explosives. The “shaker” named in many versions of the John Henry narratives was the man who held the steel drill—a steel rod a little larger than an inch in diameter and anywhere from 2 to 14 feet in length. The shaker’s job was to turn and shake the drill to keep its cutting edge clear. Keeping a rhythm with the man who was swinging a 40-pound block of steel at him was extremely important; thus, the song about John Henry was an integral part of the songs a worker like John Henry most likely would have sung himself, and vice versa.

Most John Henry narratives, whether in story or song, contain at least these ingredients: his infant prophecy, his love for a woman, his test against the machine, his victory, and his death. Of course, not every instance must contain all of these parts, nor must it limit itself to them. Another common aspect is the formal style of most of the songs, which have the last line of each verse repeated, as in this stanza:

John Henry said to his Captain,
 “A man ain’t nothin’ but a man,
 And before I’ll let your steam drill beat me down,
 I’ll die with this hammer in my hand, Lord, Lord,
 I’ll die with this hammer in my hand.”

The focal point of the John Henry story is the contest between man and machine, in which the man wins but dies from exhaustion. Contests between drivers were common, and it seems only logical that the idea, if not in fact at least in fiction, be extended to the

products of the Industrial Revolution. There is no record of any such race ever having taken place, but drill manufacturers were pressing their machines into operation everywhere, challenging the work forces of skilled laborers. Such a concern with technology explains not only the rapid spread of the ballad across geographic and racial distances, but also its recurring popularity and significance for contemporary audiences.

Henry, Lorenzo (“Len”) (18527–1946)

North Idaho tall-tale teller; regional Münchhausen figure. Although he was described in his obituary in the Lewiston *Idaho Morning Tribune* as “a great storyteller,” only four short examples of Henry’s tales were published the year following his death. His repertoire of “windies” survived in oral tradition of the area until collected in the early 1960s by Jan Harold Brunvand and his students at the University of Idaho. One hundred sixteen versions of sixty-seven distinct stories were told to the fieldworkers by twenty-eight informants. The tales either matched well-known traditional types and motifs (about half of the stories) or came from Henry’s creative imagination working with frontier themes like hunting, fishing, and farming. Typical of Münchhausen narrators, Henry told his lies in the first person, developing the persona of a trickster and skilled outdoorsman.

Little is known of Henry’s life except that his family originated from Pennsylvania German stock, that he was probably born in Kansas City, that he migrated to Idaho in the 1860s, and that he had married a Nez Perce woman and moved to Indian land near Lapwai and Sweetwater, Idaho, in the 1890s. As a “Squawman,” Henry may have been the object of scorn, but his skills as a narrator overcame the stigma, and he was remembered by former neighbors and friends as a likeable, entertaining, quick-witted person. One informant remarked that Len could tell stories “anytime, anyplace, anywhere”; another commented, “He always had something, no matter what you brought up...and later on he’d tell the same story exactly the same way” (Brunvand 1985).

More likely, however, Henry, like other tall-tale tellers, adapted the style and content of his stories to different audiences. For example, the story about his dog getting stuck on a curve of a winding mountain road after Henry had guided a large horse-drawn wagon along the same route without difficulty was told by several informants, each asserting that he or she was repeating the tale exactly as Henry told it. But details differed among narrators as to the number of horses, the kind of dog, where the wagon was going, and how Henry rescued his stuck dog.

Henry was best known for such familiar tales as “The Frozen Echo,” “The Popcorn Freeze,” “The Sprouting Buggy Whip,” “The Snake-Bit Hoe Handle,” and “The Wonderful Hunt” (Tale Type 1890). His other stories bragged up his own abilities as a rider, roper, or shooter. (He once bought just two rifle shells, commenting, “Your damn game laws only allow me one deer and one elk”; and he claimed that he had shot a horse that was falling down a cliff, to put the creature out of its misery, seven times before it hit the ground—using his six-shooter!)

One anecdote about Henry’s quick wit reveals adaptive borrowing of a motif. He was watching someone tune a car engine one time, and he accidentally put his hand on a sparkplug of the running engine. He pulled his hand quickly away, and the man asked, “Did it shock you, Len?” The storyteller replied, “Nope, I was too quick for it.” The remark is an updating of the punch line of a traditional story about a man who picks up a hot horseshoe, drops it at once, and claims, “It just don’t take me long to look at a horseshoe” (Brunvand 1987).

Henry, Mellinger Edward (1873–1946)

Collector of American folksong and balladry, teacher of English, and avid outdoorsman. Henry was born in 1873 at Mount Pleasant, Pennsylvania. He graduated from Brown University in the class of 1899 and pursued additional studies at Harvard and Columbia Universities. From 1906 until 1937, he taught high-school English in Patterson and Jersey City, New Jersey. On August 3, 1921, Henry was married to Florence Stokes of Atlanta, Georgia.

The Henrys were vacationing in the North Carolina mountains in 1923 when they attended a lecture on balladry given by Prof. C. Alphonso Smith. Inspired, they soon began collecting songs from people they met during their regular summer trips to the Blue Ridge and Great Smoky Mountains. Henry took down the words to songs (and later concerned himself with researching variants and sources), while Florence Henry, being musically trained, was able to notate the tunes.

Once the nucleus of a collection was established, Henry sought to put the materials into perspective by corresponding with other folksong scholars. Among those offering encouragement and information were George Lyman Kittredge, Robert Winslow Gordon, Fannie Hardy Eckstorm, Louise Pound, Arthur Palmer Hudson, Guy Benton Johnson, and Mary O. Eddy.

Although Henry was interested in the literary aspects of ballad poetry and the effects of oral transmission, he was more than an armchair scholar. His enthusiasm for song collecting was second only to his passion for hiking and mountain climbing, and he belonged to numerous mountain clubs in the East. Through editorials, articles, and lectures, he encouraged the opening of the Blue Ridge Mountain region for vacationers through the creation of trail networks for hikers and climbers. He admired, and felt an affinity with, many of his informants whom he perceived as living the outdoor life. Ironically, as the National Park Service began to take an interest in the region, several of Henry's singer-informants found themselves forced to sell their land and relocate as a result of the establishment of the Great Smoky Mountains National Park in the 1920s.

Henry was a founding member of the Southeastern Folklore Society and took an active role in festivals, including the White Top Folk Festival in southwest Virginia.

In 1931 and 1932, a substantial portion of the Henrys' collection appeared in two installments in the *Journal of American Folklore* (Henry 1931, 1932). A book, *Songs Sung in the Southern Appalachians*, was published in 1934 and was supplemented in 1938 by *Folk Songs of the Southern Highlands*. These works offered careful documentation of sources and broke away from the organizational model of "Child ballad and other" followed by many earlier works. The inclusion of song fragments as well as music notation was a credit to the Henrys' understanding of the needs of folksong study.

Henry's contributions to folksong scholarship exemplified what was possible by an amateur collector. Over the course of three decades, he climbed mountains in the Appalachian chain from Maine to Georgia and, in the process, made friends with many

excellent folksingers in the Southern Highlands, including members of the now well-known Harmon and Hicks families.

Henry died at Englewood, New Jersey, on January 31, 1946, and was buried in West View Cemetery, Atlanta, Georgia. Florence Henry donated her husband's papers and ballad collection to the John Hay Library at Brown University.

Herskovits, Melville Jean (1895–1963)

Africanist and anthropologist. Born in Bellefontaine, Ohio, on September 10, 1895, Herskovits was elected president of the American Folklore Society in 1945 and served as editor of *American Anthropologist* from 1949 to 1952. A man of many interests, he was recognized widely for his strong commitment to humanistic anthropology and for his concern with the total range of human cultural behavior. Herskovits made significant contributions to folklore as well as physical anthropology, ethnology, culture contact, ecology, economic anthropology, material culture, art and aesthetics, applied anthropology, African American studies, and African studies. A pioneer in African American studies in the United States, he was one of the first anthropologists to scientifically trace links between Africa and the New World. With the publication of his seminal *The Myth of the Negro Past* (1941), he single-handedly formulated what was to become a major focus of worldwide scholarly inquiry and debate. In recognition of his many accomplishments, Herskovits was appointed to the first chair of African studies in the United States, at Northwestern University in 1961.

Herskovits studied at Hebrew Union College and at the University of Chicago, where he earned his B.A. in history in 1920. He received his M.A. (1921) and Ph.D. (1923) degrees in anthropology at Columbia University under Franz Boas. His dissertation dealt with the cattle complex in East Africa. He also studied at the New School for Social Research with anthropologist Alexander A. Goldenweiser and economist Thorstein Veblen. After briefly teaching at Howard University, Herskovits spent the remainder of his long academic career at Northwestern University, where he influenced several generations of researchers, among them William R. Bascom, James W. Fernandez, Daniel Crowley, Richard Waterman, Richard M. Dorson, and George Eaton Simpson (cf. Simpson 1973).

Ably assisted by his wife and professional collaborator, Frances S. Herskovits, he conducted fieldwork in Suriname, sub-Saharan Africa, Haiti, Brazil, and Trinidad. His research in Suriname and Africa—primarily funded by folklorist Elsie Clews Parsons—resulted in the publication of two important folklore volumes: *Suriname Folk-lore* (1936) and *Dahomean Narrative: A Cross-Cultural Analysis* (1958). *Dahomean Narrative* offered a critique of then current theories of myth from the perspective of the authors' field experiences as well as native Dahomean categories distinguishing myths (*hwenho*) from tales (*heho*). This study also contains an intriguing analysis of sibling rivalry and the Oedipal complex in an African society. The Herskovitses also made major contributions to ethnomusicology, recording both singing and instrumental music from Suriname, Dahomey, Ashanti, Nigeria, Togoland, Trinidad, and Brazil as well as providing thorough documentation of dance and drumming in Haitian *vodun* and Trinidadian *shango*. A major theoretical contribution to folklore is Herskovits' 1946 presidential address to the American Folklore Society, "Folklore after a Hundred Years: A Problem of Definition," in which he posits a useful distinction between "folk

literature” and “folk custom” and suggests that folklorists confine their interests to the former category. Herskovits died on February 25, 1963, in Evanston, Illinois.

Herzog, George (1901–1983)

Ethnomusicologist, anthropologist, and folklorist. Born in Hungary, Herzog studied in Berlin with E.M. von Hornbostel, immigrated to the United States in 1925, and completed his Ph.D. at Columbia University under Franz Boas. Beginning in 1926, he made repeated trips over two decades to do ethnomusicological fieldwork among Native American peoples, including Pueblo, Pima, Yuman, Comanche, and Navajo peoples, recording songs and studying their sociocultural contexts. From 1930 to 1931, he studied the verbal art and linguistic signaling systems of the Jabo in Liberia.

Herzog held two Guggenheim Fellowships and was involved in the founding and development of several scholarly organizations. From 1932 to 1948, he served on the faculty of Columbia University, and from 1948 until his early retirement in 1958 for reasons of health, at Indiana University. At both institutions he was responsible for pioneering the establishment of leading programs in ethnomusicology.

More than anyone else, Herzog is credited with establishing ethnomusicology (called “comparative musicology” before 1950) in the United States. He fashioned a holistic but unified style of research from the methods of Hungarian folkmusic research developed by Béla Bartók, the comparative studies of the Berlin ethnomusicologists, and cultural anthropology as taught by Boas. He was further influenced by the Finnish school of folkloristics, as represented in the United States by Stith Thompson, and by Bloomfieldian linguistics.

Herzog’s most influential publications date from the 1930s and include the earliest detailed comparative work, the recognition of tribal musics as systems of thought, the use of music in ethnohistory, the relationship of language and music, and historical stratification in music. Exhibiting a great variety of interests, his substantive contributions appeared exclusively as articles in folklore and anthropology journals.

Hicks-Harmon Families

An enormous extended-family complex noted for its large number of active bearers of Appalachian folklore. Emanating from “the Beech,” the area on and near Beech Mountain in Avery and Watauga Counties, North Carolina, dozens of members of these families have for nine generations contributed both directly and indirectly to several important studies of American folklore, performing folktales (especially Jack tales), legends, lyrical folksongs, ballads, instrumental tunes, religious music, dances, and woodcrafting, and passing along folk customs and folk beliefs.

The parents of David Hix (later Hicks) (ca. 1719–ca. 1792) are assumed to have moved from England (one scholar suggests from Somersetshire) to Richmond, Virginia, during the late 17th century. It is known that in 1778 or so Hicks moved his family from the North Carolina Piedmont to the Upper Watauga River area in the northwestern part of the state, located near the crest of the Blue Ridge Mountains. David’s son Samuel (known in the region as “Big Sammy”) (ca. 1753–1835) built a home near his father in the fertile valley now known as Valle Crucis. Both Samuel and his son “Little Sammy” (ca. 1800–?) were extraordinarily talented performers of folk traditions, especially music and Jack tales. This British folklore was perhaps intermingled with German traditions when Big Sammy’s daughter Sabra (1785–?) married Andrew Harmon (1789–1814).

Andrew was the grandson of George Hermann (1710–1787), who had moved to America from Mittelfranken, Germany, about 1725, and the son of Cutliff Harmon (1748–1838), who settled in the Upper Watauga area in 1789. Among the children of Andrew and Sabra was Council (1807–1896), who became the major conduit for the transmission of a substantial body of Hicks-Harmon folklore.

When Council was seven years old, his father dead and his mother moved from the region, he was accepted into the household of his grandfather Big Sammy, where he absorbed the rich folklore of the Hickses. Council reported in his later years that he had learned his lore from his mother, Sabra Hicks, and his grandfather, who could have been either Big Sammy or Cutliff Harmon. Existing evidence suggests, however, that the Hickses were the source of Council’s repertoire, although it is tempting to entertain the notion that the Hermanns were familiar with the stories that were to be included in the Grimm brothers’ *Nursery and Household Tales* published in 1812.

“Old Counce” Harmon eventually became a master storyteller, musician, and dancer who liked to drink and have a good time. In fact, he was “churched” (brought before the congregation and publicly expelled) on several occasions. Many of Counce’s progeny assimilated the old man’s traditions and went on to become gifted performers.

For example, during the last few years of his life, Old Counce lived with his daughter Sarah and her husband, A.J. Ward. The Ward children, especially Roby Monroe (1875–1944) and Miles (1877–1956), spent many hours listening to Counce’s stories, later becoming, along with Miles’ son Marshall (1906–1981) and the brothers Ben and Roby Hicks, primary contributors to folklorist Richard Chase’s three books on Appalachian folklore: *The Jack Tales* (1943), *The Grandfather Tales* (1948), and *American Folk Tales and Songs* (1956).

Counce’s grandson Reverend Lee Monroe Presnell (1876–1963), along with several other members of the Hicks-Harmon families, was featured on the excellent recordings

produced by Sandy Paton and Lee B. Haggerty on Folk-Legacy Records, *The Traditional Music of Beech Mountain, North Carolina* (1964, 1965).

The Hicks and Harmon families were united once again when Council's son Goulder (ca. 1844-?) married Little Sammy's daughter Nancy Jane Hicks (ca. 1844-?). Their son Samuel (ca. 1869-?) and his wife, Pollyanna (ca. 1874-?), both absorbed the family traditions, and they were "discovered" in 1928 by Mellinger Henry. Many of this couple's songs are included in Henry's *Folk-Songs from the Southern Highlands* (1938).

The first member to share family traditions with a folklorist, however, was Council's granddaughter Jane (Mrs. Eugene) Gentry (1863-1925), who in 1916 contributed sixty-four songs (more than any other informant) to the seminal collection *English Folk Songs from the Southern Appalachians* (1932) by Cecil Sharp and Maud Karpeles. Sharp ignored Jane Gentry's fund of folktales, but in 1923 Isabel Gordon Carter collected fifteen stories from her (most of them Jack tales), which were published in 1925 as "Mountain White Folk-Lore: Tales from the Southern Blue Ridge" (*Journal of American Folklore* 38:340-374). This important piece of scholarship provides unadulterated narrative texts from the Beech, predating Richard Chase's modified composites by eighteen years. Moreover, Jane Gentry's daughter Maud (Mrs. Grover) Long (1893-1984) also became an accomplished singer and storyteller, recording her lore for the Library of Congress in 1947 (released as AAFSL47, Jack tales; and ASFSL21, songs).

All during this time the strong body of Hicks traditions continued to flourish. For example, Fanny Hicks (1837-1914), Big Sammy's granddaughter, passed on her immense repertoire of songs to her granddaughter Nora (1886-1953), who later contributed to *The Frank C. Brown Collection of North Carolina Folklore*.

Perhaps the most propitious event in the development of Hicks-Harmon family folklore occurred when Little Sammy's grandson Samuel III (1848-1929) married Old Counce's daughter Rebecca (1842-1919), once again crossbreeding the families' traditions. From this union came Ben, Andy, and Roby, who became immersed in the folklore of both families. Ben, his son Nathan and granddaughter Ray, Andy's daughter Rena (who married Nathan), and Roby, along with his wife, Buna Vista, and their son Stanley, have contributed to several major folklore collections, including the Chase books, the Foxfire books and records, Thomas G. Burton's *Some Ballad Folks* (1978), and Frank and Anne Locher Warner's collection of folksongs. Stanley (1911-1989) and Ray (1922-) have become the most widely known disseminators of the Hicks-Harmon lore, having appeared often at local and national concerts and festivals and, along with Marshall Ward, serving as the subjects of Cheryl Oxford's excellent study "*They Call Him Lucky Jack*": *Three Performance-Centered Case Studies of Storytelling in Watauga County, North Carolina* (Ph.D. diss., Northwestern University, 1987). Among their many honors was the National Heritage Fellowship award, given to both in 1983.

Aside from Ray Hicks, a superb storyteller and undisputed master of Jack-tale performances, the Hicks-Harmon traditions are being kept alive at the dawn of the 21st century by Frank Proffitt Jr. and Orville Hicks. Proffitt (1946-) inherited the lore of both his mother, Bessie (Ray Hicks' sister), and his father, Frank, the celebrated folk musician. His narrative style influenced primarily by his uncle Ray, Proffitt appears regularly in public telling Jack tales and other stories and performing folksongs on the dulcimer and fretless banjo, including his father's famous rendition of "Tom Dooley." Orville (1951-) is the son of Gold and Sarah Hicks, Council Harmon's granddaughter, who taught him

around fifty stories, about half of them Jack tales. Orville Hicks also performs regularly for schools, colleges, and other local and national programs. In recent years, he has absorbed a great deal about storytelling from Ray Hicks, and he enjoys the master's blessing as his heir apparent.

Hill, Joe (1879–1915)

Songwriter and satirist, poet and performer, romantic drifter with a vision. Hero and martyr for America's radical labor movement, Hill was Born Joel Hägglund in Galve, Sweden, on October 7, 1879. After immigrating to America, Joe became involved in radical unionism and helped pioneer the use of protest songs as instruments of social change. Two of his best-known songs are "Casey Jones: The Union Scab," a parody of the folksong, and "Pie in the Sky," (Hill coined this phrase; it became the popular title of his song "The Preacher and the Slave," an anthem calling for the betterment of the workingman's lot in this life, not the next).

Through his skills as composer and performer, Hill became an influential member of the Industrial Workers of the World (popularly known as the IWW or the Wobbly Party), and he guided that organization's recruitment and propaganda strategies toward public singing events. IWW cultural performances had the look and feel of evangelical revivalism—a fact underscored by Hill's coupling of his lyrics with traditional and popular gospel tunes. The IWW advocated direct action (slowdowns, strikes, purposefully poor workmanship) to take over the means of production rather than the political negotiation favored by the American Federation of Labor (AF of L). The IWW held that the interests of workers could never be reconciled with those of management. Unlike other unions, the IWW was far ahead of its time in promoting racial equality. Although they eschewed violence, Wobblies were widely regarded as instigators behind many of the terrorist attacks that fueled the Red Scare of the early 20th century.

While the Wobblies remained a political force at the fringes of power in America, the appealing humor and witty sarcasm of Hill's songs caused the movement to gain recognition beyond what its membership roles might suggest. Hill inspired others to compose folksongs about him even as he continued to produce his own. In the later 20th century, Hill's memory has been perpetuated by American folk singers—notably, Pete Seeger and Woody Guthrie.

Hill's immortality as a folk hero was sealed on November 19, 1915, when he was executed in Utah for murdering a Salt Lake City merchant, but the fairness of Hill's trial was a matter of heated and public debate. National figures such as Samuel Gompers, Helen Keller, and Woodrow Wilson raised voices on his behalf, but to no avail. Hill's parting words of protest were, "Don't waste any time in mourning—organize!"

History, Folk

A body of oral narratives told by people about themselves. Such narratives articulate the feelings and attitudes of individuals and groups about the events and persons described. Folk history is thus people history—history from a personal view. It is intricately tied with the subjectivity of those who talk about it, and it is very often history from the bottom up—history in which the people themselves become their own chroniclers.

One school of thought holds that firsthand information about the past should be labeled oral history, and that secondhand or traditional information about the past is folklore. Another viewpoint regards oral history and folklore as alike in their use of the spoken word as a medium of expression. Folk history and oral history, as defined by folklorists, are indeed one and inseparable. The methodology is the same, and may be divided into three component parts. The first is folk history as *firsthand*, or *eyewitness*, history. This is history based on a testimony that says, “I was there, I saw or took part in the action, and this is the way I recall what happened.” Eyewitness accounts have been used by folk historians since the Greeks began the practice more than 2,500 years ago. Ancient Hebrews used both firsthand and traditional oral accounts even earlier to produce much of the Old Testament.

Contemporary eyewitness testimonies offer insights into all aspects of local life and culture, including, for example, African American attitudes toward their insecure status prior to desegregation; senior citizens’ feelings about retirement, economic well-being, and life in nursing homes; and the way people of all ages feel about their roles in society.

The second component of folk history comprises the information provided by narrators who are one or more generations removed from what is being described. They know of an event or topic, not because they were there personally, but because they talked with someone who was. The information thus narrated is *secondhand*. It may not be as trustworthy as a firsthand account, but it is historically valuable when interpreted with care. Valuable sources of secondhand folk history might include children of parents and grandparents who crossed the ocean to America, great grandchildren of Black slaves, children whose parents lived through the throes of the Great Depression of the 1930s, and the grandchildren of Jewish or Lebanese entrepreneurs who began their careers peddling their wares across the South and Midwest.

The third variety of folk history consists of *oral historical traditions*. This is a large, often unwieldy, but fruitful corpus of information. Included are traditional accounts based in fact, traditions based on hearsay, and those that merely express what people wish had happened. Whether oral traditional stories are proven fact, unverifiable hearsay, or wish fulfillment, all are worthy of being recorded, as living generations may learn much about previous generations from narratives told repeatedly in family and community circles. This form of folk history is often our only meaningful link with the past.

It may be that any group’s oral historical traditions are microcosms of national history and that these oral kernels could provide insight into the attitudes of the American people both now and a century or more ago toward the major events of the day. In this regard, the context or setting of the narration becomes as important as the narrative text itself. The attitude toward the truth of history is as important as the bit of truth conveyed. Granted, most local oral traditions are not oriented to the nation’s capital. Indeed, most

oral historical texts are inner-directed, being mainly concerned with family and community affairs and with the role of the individual in community perspective. Thus, the major thrust of folk history is directed toward gathering verbal documents that can be used as source materials in the study of community life and thought.

In reconstructing folk history, the researcher defines local geographical and/or cultural boundaries in accordance with the concepts held by the people who live there, since their statements and feelings about their way of life may differ sharply from those of outsiders. Since folk history is necessarily oral, it is not to be found in archives and libraries, except in unpublished manuscripts that are, themselves, generally based on oral accounts. Thus, obtaining folk history calls for (1) conducting as many tape-recorded interviews as necessary with carefully chosen interviewees of varying age, sex, and race; (2) obtaining written permission from all narrators to use materials contained in the taped interviews; (3) organizing the information gathered in each interview according to chronological and topical categories; and (4) interpreting what people say in accordance with their own concepts of what is historically significant. The folk historian must also be familiar with published information and archival collections relating to the community or subject under study, using these materials as corroborative evidence when testing oral information for validity.

The historical data contained in oral narratives, whether personal, secondhand, or traditional, permit researchers to interpret significant topics of any human group in light of the totality of its history. Any facet of history, contemporary or earlier, is worthy of being recorded and preserved if the living generations treasure it enough to talk about it. Folk history is valuable to researchers because of the manners in which it reveals people's feelings about themselves in relation to their families, their communities, and to the land itself.

In addition to people's associations with generations past, they also have knowledge of buildings and other tangible objects on the culture landscape because of personal identification with them, or because of local stories that contain mention and description of these physical objects. The reasons human beings retain information of historical interest often explain as much about the people as the kernels of truth contained in their oral recollections. The recollections themselves explain history; the reasons for passing along these accounts orally explain the mind of the community and its people and help set it apart from surrounding communities.

Advantages of tape recording folk histories include (1) having available the exact words uttered by the narrator, as pauses and vocal inflections frequently say as much as words; (2) capturing the speaker's colloquial and dialectical tone of voice; (3) obtaining individual views, which may be at variance with what is commonly accepted, about contemporary and past local history; (4) obtaining new and exciting kinds of evidence; and (5) filling in gaps detected in formal historical records.

Imperfections inherent in oral folk history are readily apparent. Yet, in the skilled hands of properly trained researchers, oral texts can be weighed carefully so as to separate the core of historical truth from the intrusive folk motifs and migratory legends that are often used to polish good stories and make them even better for a listening audience.

In orientating themselves to this distinct type of local history, researchers learn to place stress on the large number of Americans, living or dead, whose lives were and are

shaped by folk concepts, customs, beliefs, and traditional patterns of living. The story of these people, submerged and unknown to the world at large, represents a whole new area of historical research and writing.

Numerous exemplary studies are based on American folk, or “grass-roots,” history. These include, in addition to the works listed as references below, Kai T.Erikson’s *Everything in Its Path: Destruction of Community in the Buffalo Creek Flood* (1976), which documents local response to the cataclysmic flood in 1972 that devastated a West Virginia community; Sherna Gluck’s *From Parlor to Prison: Five American Suffragists Talk about Their Lives* (1976), which explores the life experiences of five women deeply involved in the women’s suffrage movement of the late 19th and early 20th centuries; Tamara Hareven and Randolph Langenbach’s *Amoskeag: Life and Work in an American Factory City* (1978), comprising the social history of textilemill workers in Manchester, New Hampshire; Edward D.Ives’ *Joe Scott: The Woodsman-Songmaker* (1978), a book set in the lumberwoods of Maine with emphasis on a local songmaker and what his song creations meant to him and others; William Lynwood Montell’s *Killings: Folk Justice in the Upper South* (1986), which affords a penetrating look at homicidal behavior and prevailing attitudes and values surrounding violent deaths in a Kentucky-Tennessee border area; and Kathryn L. Morgan’s *Children of Strangers: The Story of a Black Family* (1980), which provides keen insight into the strategies used by Blacks raising their families in a White-dominated society.

Hoedown

Both a vigorous rural dance and the musical accompaniment for it. Any discussion of the term involves both the history of American folk and popular dance *and* the story of American popular and folk instrumental music.

The *Dictionary of American Regional English* lists the word under the main entry “Breakdown” as a synonym along with “shindig.” The first appearance of “breakdown” is in a text from 1819. The OED (*Oxford English Dictionary*), however, locates “breakdown” in 1864 and “hoedown” as early as 1860. Richard Hopwood Thornton’s *An American Glossary* (1912, 2d. ed. 1962) does not include “breakdown” but has three entries for “hoe-down.”

What appears to be fairly clear respecting the dance tradition is that quite early, perhaps by the last quarter of the 18th century, a style of dancing heavily influenced by Blacks, rapid and vigorous in execution, and identified with gatherings of rural people had developed. It was variously called a breakdown or a hoedown.

A note on the “raftsman passage” from Chapter 16 of the *Adventures of Huckleberry Finn* is enlightening. The text describes a keelboat crew in a moment of recreation:

Next they got out an old fiddle, and one played, and another patted juba, and the rest turned themselves loose on a regular old-fashioned keelboat breakdown. They wouldn’t keep that up very long without getting winded....

Both dances were of Negro origin: juba, much like a vigorous tap dance to a clapping accompaniment; and breakdown, a sort of shuffling dance to a fast beat. Bruce R. Buckley describes the juba as “an African jig-type step with elaborate variations, including stiff-legged shuffles and hops” (Buckley 1968:140).

It is likely that the widespread clogging-step dancing-jigging among the English, Scottish, and Irish immigrants to the New World provided a stimulus that enabled Blacks to accommodate this European tradition to their own usages, among which the juba was prominent. In notes accompanying a 1976 Library of Congress issue of *American Fiddle Tunes*, Alan Jabbour identifies the reel as the same as a breakdown. Thus, another stimulus was the set dance—reels, quadrilles, and square dances often accompanied by the fiddle in 2/4 or 6/8 time.

As for the music to which the hoedown was danced, Robert Perry Christeson’s two-volume *The Old-Time Fiddler’s Repertory* offers about 200 tunes in musical notation with key signatures and time indications, identifying them as breakdowns, quadrilles, and “pieces.” Here, indeed, are most of the favorites of both dancers and fiddlers: “Soldier’s Joy,” “Devil among the Tailors,” “Hell among the Yearlings,” “Gray Eagle,” “Tom and Jerry,” “Mississippi Sawyer,” and many more, not to mention breakdowns identified by number rather than title (Christeson 1973–1984).

It is not uncommon for fiddlers to refer to these tunes as square-dance tunes, quadrilles, or simply dance tunes. What some fiddlers play in 2/4 time, others play in 6/8. And the variations in the names of the tunes show the same folk process of dynamic variation apparent in the execution of the tunes: “Forked Deer,” “Forked Horn Deer,” “Forky Horn Deer,” “Durand’s Hornpipe,” “Durang’s Hornpipe,” “Durango Hornpipe,” and so on.

In the absence of solid evidence, folk etymologists have supplied engaging, imaginative, and perhaps even accurate ways of accounting for the terms “hoedown” and “breakdown.” By some it is suggested that a certain configuration in the dancing of a quadrille is called a breakdown. Why it is not called something else is not clear. Another explanation is that in performance a fiddler breaks the piece down into its most musical components of melody and rhythm and concentrates upon them, an explanation not unlike the familiar “emotional core” of which a ballad consists. Another explanation holds that both terms refer to a work stoppage. When a breakdown in some part of a work process occurred or when an essential piece of equipment was broken—a wagon made immobile because of a broken coupling pole or “reach,” for instance—there was a corresponding moment of leisure until the equipment could be repaired. During this lull, the hoes (perhaps a metonym for all hand implements) were laid down, and the juba and step dancing-jigging-clogging were performed.

Yet another folk etymologist suggests that in performing a breakdown-hoedown the dancers’ improvisations included imitations of wielding a hoe. A final explanation claims that the expression “hoedown” conveyed the idea of speed. Thus, rapid dancing would have that term applied to it. If this last explanation seems either ingenuous or ingenious, one might reflect upon the last stanza of “Dixie”:

Dar’s buckwheat cakes and Injun batter,
 Makes you fat or a little fatter:
 Look away, look away, look away, Dixie Land!
 Den *hoe* it *down* and scratch your grabble,
 To Dixie’s land I’m bound to trabble;
 Look away, look away, look away, Dixie Land!

Make haste, line four of this mid-19th century song says, using the words in verb form, hurry it up, dig out, and get yourself back to Dixie.

If today's "Flint Hill Special" and "Foggy Mountain Breakdown" are representative, the present notion of a breakdown or hoedown features strong rhythm, a driving banjo or banjo-fiddle lead, and speedy execution, appropriate for clogging but probably too fast for a square dance.

Holler

A brief loud melodic phrase characterized by highly stylized vocal techniques including yodel-like glottal snaps, falsetto, staccato, blue notes (in African American tradition), and various other techniques employing a wide tonal compass. The holler characteristically employs vocables, or meaningless syllables, rather than words and is performed without instrumental accompaniment. Musical and entertaining in form, the holler is generally performed outdoors and may also be performed to communicate as signals, animal calls, greetings between farmers, and by vendors announcing their presence. Because they are individually stylized vocal performances bearing the unique style of the individual performer, hollers are a musical oddity that do not readily lend themselves to written description. Performances may range from a gently rising melismatic whooping sound to an energetically hooted falsetto rendition of a popular hymn.

Although hollers and hollering are documented in both Caucasian and African American traditions, most references to the holler occur in publications by collectors and scholars treating them as idiomatic material closely related to worksongs and blues. One of the earliest descriptions appears in 1856 in Frederick Law Olmstead's *A Journey in the Southern Slave States*, in which he described shrill music "whoops" of Negro laborers as "Negro jodeling" and "Carolina yells." Numerous other writers in the first half of the 20th century viewed the holler in relationship to the development of early blues, often pointing to characteristic wordless moan-like refrains and advancing the view that the holler is an antecedent to the blues. Contemporary thinking de-emphasizes the romanticized view that the holler is a pre-blues form and suggests that hollering was one among a familiar stock of vocal techniques from which performers borrowed.

The term "holler" also subsumes a broad range of stylized vocal performances that share many common elements. Remarkably similar performances have been reported as cattle calls, street cries and shouts, and the shantymans "sing-outs."

Although hollers are rarely performed in the 1990s, there is broad public recognition of the term due to the continued media coverage of the annual Spivey's Corner Hollering Contest since its beginning in North Carolina in 1969. During the contest's early years several participating traditional performers appeared on national television and radio programs.

Howard, Dorothy Mills (1902–)

Teacher and folklorist. Howard was a pioneer and innovator in the study of children's folklore. In her 1938 doctoral dissertation, *Folk Rhymes of American Children*, she collected directly from children, rather than from adults recollecting their childhoods, as her predecessors such as William Wells Newell had done. She insisted throughout her long career that the children themselves must be the focus of research regarding children's traditions.

The eminent British folklorists Iona and Peter Opie contacted her early in their careers, and she was a strong influence on the development of their theories and techniques regarding the collection, documentation, and analysis of children's folklore.

After teaching for a time in public school, Howard spent the rest of her career as an English professor at Frostburg State College in Maryland, serving also as department head. She retired in 1967 and then served as a consultant for the Tri-University Project in children's playlore of the University of Nebraska, New York University, and the University of Washington. From 1954 to 1955 she was awarded a Fulbright Fellowship to study and collect children's folklore in Australia, a subject on which she published widely and an interest she continued for the rest of her career. Most of her publication was in the form of articles in scholarly and professional journals. She published three books, one an autobiographical study of her own childhood, *Dorothy's World: Childhood in Sabine Bottom, 1902–1910* (1977); another (with Eloise Ramsey) a critical and descriptive bibliography for use in elementary and intermediate schools, *Folklore for Children and Young People* (1952); and the last one the documentation of the life of a Mexican village boy, *Pedro of Tonala* (1989).

Hudson, Arthur Palmer (1892–1978)

Folklorist, teacher, and editor of folklore collections. Hudson was born in Attala County, Mississippi. He earned his B.S. and M.A. degrees (1913, 1920) from the University of Mississippi and taught there. After a second M.A. (1925) from the University of Chicago, and a Ph.D. (1930) from the University of North Carolina, he accepted a position at the University of North Carolina, where he taught folklore and British romantic literature. He received a Kenan Professorship in 1951.

Hudson became aware of folklore as an academic field from E.C.Perrow, his freshman English instructor at the University of Mississippi, and he formed his scholarly approaches in subsequent study with Louise Pound and Archer Taylor at the University of Chicago. His motivation for folklore research probably derived from experiences he described in an autobiographical sketch, "An Attala Boyhood" (Hudson 1942), and is most clearly seen in his published lecture series, *Folklore Keeps the Past Alive* (1962).

Although his books are clearly a product of their time, *Folksongs of Mississippi and Their Background* (1936), *Humor of the Old Deep South* (1936), and *Folklore in American Literature* (1958) show him to be a meticulous editor of texts. With H.M.Belden, he edited the two volumes of song texts in *The Frank C.Brown Collection of North Carolina Folklore* and was probably the best of many editors who collaborated on that work.

Hudson succeeded Frank C.Brown as secretary-treasurer of the North Carolina Folklore Society and guided it for more than twenty years. During that time, he edited the society's journal, *North Carolina Folklore*.

From 1950 until 1963, Hudson served as head of the curriculum in folklore at the University of North Carolina. At the close of his teaching career, he donated his materials to the University of Mississippi and the University of North Carolina. The latter collection formed the nucleus of the university's Southern Folklife Collection, one of the nation's major folklore archives.

Humor

A distinct form of communication involving comical or amusing ideas and situations. The study of humor arose late in the consciousness of folklorists. Although early folklorists collected humorous materials, they did so because that humor was encapsulated in recognized traditional genres—tales, ballads, proverbs, riddles—not because of any interest in humor per se. Wilhelm and Jacob Grimm included numerous humorous tales in their *Kinder und Hausmärchen* (1812–1816) because these tales, alongside those of magic and adventure, were alive in the mouths of the folk. The interest of the 19th-century English folklorists in “folk wit” was an interest in proverbs and riddles as a repository of old “wisdom,” not humor. Francis James Child included humorous texts in *The English and Scottish Popular Ballads* (1882–1898) because they met his criteria for traditional narrative song.

When the historic-geographic, or Finnish, method came to dominate folklore study in the first half of the 20th century, humor was regarded as something embedded in a traditional text whose origins and routes of diffusion might be reconstructed. Humorous tales, like magic tales, were classified and comparatively scrutinized according to this method. Humorous tale types and motifs were cataloged in the great international and regional indexes. The historic-geographic approach gave further impetus to the collecting of humorous texts, and thousands were published in journals and regional collections in both Europe and the United States, but no interest was expressed by folklorists then in how humor might be defined, how humorous texts were structured, or what their communicative possibilities might be.

Folklorists were awakened to these possibilities by American social and literary historians. As early as 1838, it had been suggested that the originality and distinctiveness of American literature lay in its unique style of humor, but it was only after Frederick Jackson Turner focused attention on the role of the frontier in shaping American institutions and character that historians began to explore American humor with any degree of seriousness. Jennette Tandy’s *Crackerbox Philosophers in American Humor and Satire* (1925) and Frank J. Meine’s *Tall Tales of the Southwest* (1930) were the first volumes to bring a portion of 19th-century humor to the attention of scholars, but it was Constance Rourke’s *American Humor* (1931) that set out to delineate, through the scrutiny of comic figures—the Yankee, the backwoodsman, the Negro—and forms—the monologue, the rhapsody, and the tale—the outlines of an American humor and national character that profoundly influenced the shape of American literature.
